KNIGHT WHEELS. ON

By IAN HAY, Author of The Right Stuff, A Man's Man, Happy-go-Lucky, &c.

BOOK J.-THE MISOGYNISTS.

CHAPTER I .- ENVIRONMENT.

THURSDAY morning was always an interesting time for Philip, for it was on that day that he received letters from ladies. On Mondays he used to write to them, from the dictation of Uncle Joseph. On Tuesdays he had an easy time of it, for Uncle Joseph was away all day interviewing East End vicars, and Salvation Army officials, and editors of newspapers which made a speciality of discriminating between

genuine and bogus charities.

Uncle Joseph was a well-known figure in the philanthropic world—that part of it which works without limelight and spends every penny it receives upon relieving distress, and knows nothing of charity balls and grand bazaars, with their incidental expenses and middleman's profits; and it was said that no deserving case was ever brought to his notice in vain. He would serve on no committees, and his name figured on no subscription list; but you could be quite certain that when Uncle Joseph wrote a cheque, that cheque relieved a real want; for he had an infallible nose for an impostor and a most uncanny acquaintance with the habits and customs of the great and prosperous brotherhood of professional beggars. Hard-worked curates and overdriven doctors, who called-and never in vain-at the snug but unpretentious house in Hampstead on behalf of some urgent case, sometimes wondered, as they walked away with a light heart and a heavy pocket, what Uncle Joseph was worth; for it was said by those who were supposed to know that his benefactions ran into four figures annually. As a matter of fact, his income from all sources was exactly seven hundred and fifty pounds a year, and none of this was spent on

Uncle Joseph had one peculiarity. He transacted no business with the female sex. was required of him, application must be made

by a man.

On Wednesdays Philip wrote—or more usually typed—more letters, but none to ladies. On this day he addressed himself to gentlemen, tersely informing such that if they made search in the envelope they would find a cheque enclosed, 'in aid of the most excellent object

Joseph used to sign these letters. This brings us round to Thursday again; and,

mentioned in your letter,' which it would be a

kindness to acknowledge in due course.

as already indicated, this was Philip's field-day. On Thursday morning one James Nimmo, the factotum of the establishment, used to arrive shortly after breakfast in a cab from an excursion into regions unknown with quite a budget of letters. They were all from ladies, and were replies to Philip's letters of Monday. Most of them contained cheques, chaperoned by lengthy screeds; some enclosed lengthy screeds but no cheques; while a few, written in a masculine hand, stated briefly that 'if my wife is pestered in this fashion again,' 'Yours faithfully' proposed to communicate with the police.

Although these letters were all addressed to Philip, Uncle Joseph opened them himself, ticking off the cheques and postal orders, and dictating the names and addresses of their senders to Philip, who posted them up in a big book.

On Fridays Philip wrote acknowledging the letters. For a boy of fourteen he was a very fair shorthand clerk, and could take down the sentences as quickly as Uncle Joseph could dictate them. His typing, too, was almost first class, and he possessed the useful, if risky, accomplishment of being able to write two

separate and distinct hands.

Saturday was a particularly delightful day, for then Uncle Joseph and Philip put all business cares behind them, and held high revel. Sometimes they went up the river, sometimes they went to Lord's, and sometimes they took the train into the country and tramped over the Hog's Back or the South Downs. It was upon these occasions that Uncle Joseph would discourse upon Woman, and wonder, with Philip, why she had been sent into the world.

'There appears to be no parallel to the female mind,' Uncle Joseph would say, 'in any of the works of nature. It seems almost incredible that God should invent such a wonderful piece of mechanism as Man—invent him for the express purpose of controlling and developing this marvellous world of ours-and then deliberately DECEMBER 6, 1913.

[All Rights Reserved.]

stultify His own work and handicap His own beautifully designed and perfectly balanced engines by linking them up with others which are conspicuous for nothing but bias and instability. What a world this might have been, Philip, if all its inhabitants had been constructed upon a rational plan, instead of only one-half! Why is it, I wonder?'

Philip, who could not remember ever having spoken to a woman, except once or twice across a counter, would shake his head despondingly.

'Put it another way,' continued Uncle Joseph. What master-mariner, having set up a carefully designed, perfectly balanced compass upon the bridge of his ship, would then proceed to surround that compass—upon the steadiness of which the very life of the ship depends-with a casual collection of bar-magnets or soft iron What compass could be expected to point to the magnetic north for one moment in such a field of force? It would not even be a constant field of force; the magnets would come and go, or at least wax and wane in attractive power, altering the resultant intensity from year to year-from day to day, even. No compass could give a true bearing under such circumstances. And yet the Supreme Architect of the Universe has done that for us! He creates man, and having set him to direct the course of this planet, surrounds him with women! Philip-why?'

At this Philip would endeavour to look as wise as possible, but once more would find him-

self unable to contribute to the debate.

Uncle Joseph would nod his head. 'Quite right, Philip,' he would say. 'We don't know

why, and we never shall. All we can do is to bow to God's will, accept the situation, and adopt the best means at our disposal of mitigating our disabilities. There is only one thing to do. What is it, Philip?'

Philip was always quite ready this time. 'Avoid women,' he would reply gravely, 'at all times and in all places.'

After that they would talk about bird-migration, or high-tension magnetos—subjects affording easier and more profitable ground for speculation.

On the particular Thursday morning with which we are dealing, Philip and Uncle Joseph sat in the library prepared for business. Philip was installed at the broad writing-table with a reporter's note-book and a pencil. Beside him, ready for use, stood the typewriter. Uncle Joseph sprawled for the moment in an easy-chair, industriously perusing a copy of the current issue of the Searchlight, a weekly organ whose editor possessed an almost indecent acquaintance with the private lives of most of the rogues and quacks who batten upon the British public. He even went so far as to publish an annual list of their names, aliases, and addresses.

Uncle Joseph had figured therein more than once, but not as Uncle Joseph.

There was a knock at the door, and James Nimmo entered, carrying a cowhide bag. This he opened, and poured its contents upon the table—letters of every shape, size, colour, and scent.

'A heavy post this week, James Nimmo,'

commented Uncle Joseph.

'Imphm,' replied James Nimmo, who was a Scotsman. 'Could I get speaking with you, Colonel?' he added. He called Uncle Joseph 'Colonel,' because he was a colonel.

Uncle Joseph looked up sharply. 'Anything

wrong?' he asked.

James Nimmo looked at him, and, like the Eldest Oyster, shook his heavy head.

Uncle Joseph rightly took this to be a sign f assent. 'Where?' he asked.

'At Commercial Road.' As a matter of fact James Nimmo said 'Commaircial Rod,' but it will be simpler to transcribe as we go.

'I expected it,' said Uncle Joseph. He held up the Searchlight. 'These people say they

have been making inquiries. Listen.

"Do any of my readers happen to know anything of the Reverend Aubrey Buck? He appears to be devoting his undoubted talents to the furtherance of a crusade against what he calls 'The Popish Invasion of the English Home;' and to that end he is circularising the country with a passionate appeal for funds. A copy of this appeal has been forwarded to me by a correspondent. The head offices of the Anti-Popery League, from which this document emanates, are situated at 374A Commercial Road. Noting this illuminating fact, and failing to find any reference to the establishment in the Post-Office Directory, I last week despatched a representative to the Commercial Road to seek out and interrogate the Anti-Popish Buck. As I expected, 374A Commercial Road proved to be the small shop of a greengrocer - an 'accommodation address' of the most ordinary type-whose proprietor admitted that he was in the habit of taking in letters on behalf of some of his customers, but declined any further information. Enthusiastic but credulous Protestants should therefore be on their guard. The Reverend Aubrey is evidently an experienced hand, for his dupes are most judiciously selected, being entirely maiden ladies of independent means and advanced Evangelical views. From his epistolary style I cherish a shrewd suspicion that Aubrey is nearly related to my old friend Howard Glennie (Searchlight Rogues' Catalogue, No. 847), who " '-

'Man, he's a marvel, you felly!' observed James Nimmo admiringly. He was referring apparently to the editor of the Searchlight.

"Who, not long ago, as regular students of the Searchlight will recollect, spent a very profitable two years raising the small sum necessary to enable him to make provision for his aged mother before leaving this country for good, in order to devote his life to spiritual work in a leper colony—a colony situated in an island so distant that I was ultimately able to prove, to the profound chagrin of Howard Glennie, that it did not exist at all. The name of Aubrey Buck, I may add, does not appear in *Crockford.*"

Uncle Joseph laid down the paper. 'And

what do you think of that?' he inquired.

'We shall need to be getting another address,'

replied James Nimmo.

'We shall have to drop Aubrey Buck too,' said Uncle Joseph. 'However, we can't complain. We have done pretty well out of him. Let me think. I know! We will turn him into a retired University Don with paralysis in both legs, who has to do typewriting for a living. He shall send an appeal for work to every lady novelist in the country. Their name is legion. In nine cases out of ten they will send money instead of manuscript.'

'And if they do send manuscript?' inquired

James Nimmo dubiously.

'We will keep it for a week,' replied Uncle Joseph readily, 'and then return it, accompanied by a manly but resigned letter announcing that the paralysis has spread to the Don's arms as well, and he supposes there is nothing for it now but the workhouse. That ought to bring in a double donation. Tell your brother to move from Commercial Road to Islington. We have never had an address there. Were the other places all right?'

While James Nimmo proceeded with his report Philip sorted the letters on the table. The conversation did not interest him; he was accustomed to it. But the editor of the Search-

light would have appreciated it keenly.

Presently James Nimmo departed, and Uncle Joseph and Philip went through their correspondence. The letters were arranged into three heaps. The first addressed itself to 'Master T. Smith, care of the Reverend Vitruvius Smith, 172 Laburnum Road, Balham;' the other two were directed to 'The Honorary Secretary of the International Brotherhood of Kind Young Hearts, Pontifex Mansions, Shaftesbury Avenue,' and 'The Reverend Aubrey Buck, Head Office, the Anti-Popery League, 374A Commercial Road, respectively.

Most of Master T. Smith's envelopes contained postal-orders, some of them accompanied by lengthy epistles which blended heavy-handed patronage and treacly sentiment in equal proportions. Uncle Joseph read one or two aloud:

'MY DEAR LITTLE TOMMY,—I feel that I must send you something in response to your little letter, which has touched me to the depths of my heart.'

['Only five shillings,' commented Uncle Joseph, referring to the postal-order.]

'I hope your father is better, and will soon be

about his parish work again. The expense of his illness must have been very great, and I cannot wonder that you should have overheard your mother crying in the night, when she thought you were all fast asleep. Perhaps it was wrong of you to write to me for help without consulting your parents; but, as you point out, it would indeed be a splendid surprise if you could go to your father's study with a little money in your hand and say, "That is for household expenses, dear father, from an anonymous well-wisher." I think it was clever of you to spell "anonymous" correctly.'

['It was infernally silly of you,' amended Uncle Joseph, looking up for a moment.

'However'---]

'I feel, therefore, that I must fall in with your little plot. I am not allowed by law to send actual coin through the post, or you should have had a bright new five-shilling piece. ['This woman ought to be put into a home.'] So I enclose what is called a postal-order. If you sign your name on it and take it round to the nearest post-office they will give you five shillings in exchange.

'Do not apologise for your handwriting. I think it is quite good for a boy of ten. Give my love to your baby brother.—Your sincere friend,

JANE ROPER.

'P.S.—I wonder how you heard of me.'

'They all want to know that,' grunted Uncle Joseph. 'None of the silly creatures seem ever to have heard of directories.'

Master Thomas Smith gravely signed the postal-order which Uncle Joseph had pushed over to him, remarking that it was a good thing Miss Roper had not filled up the name of the post-office.

There were fifteen more letters in a very similar strain. They were not all read right through, but the name and address of the sender were always entered in the book, and the postal-orders were carefully extracted and filed. Their total value was found to be seven pounds ten shillings—this despite a disappointment caused by the last letter in the heap, which bore a small coronet on the back, and portended a cheque at least. It ran:

'MY DEAR LITTLE Boy,—I read your letter with great interest and indignation. It only proves what I have always said, that some of our noble clergy are shamefully underpaid. I do not send you any money, for to do so would be to insult a sacred profession, and I am quite sure that your little plan of offering a contribution of your own towards your household expenses, though creditable to your feelings, would meet with your dear father's deepest disapproval. I will do better than that. I have some little influence with the kind Bishop of your diocese, and if you will send me your father's full name and the name of his church

and parish—all I have at present is your home address—I will make strong representations to his lordship on your behalf. Indeed, I expect to meet him at dinner next week. I have been unable to verify your father's name in Crockford's Clerical Directory, which I always keep by me. But, you see, there are so many Smiths'——

['Quite so,' murmured Uncle Joseph in

tones of deep satisfaction.

'And the task is too difficult. However, if you will send me the details I ask for, I feel sure that the dear Bishop will make a searching inquiry into your father's case.—Your affectionate friend,

SARAH BRICKSHIRE.

'P.S.—I wonder how such a little boy as you found out my address.'

'Interfering old tabby!' observed Uncle Joseph testily. 'If she persists in this preposterous nonsense we shall have to change your venue, Philip. Now for the Kind Young Hearts!'

To judge by the contents of the second heap of envelopes, the International Brotherhood of Kind Young Hearts was an institution of variegated aims and comfortable income. pound note dropped out of the first letter opened, the sender, in her covering epistle, expressing her warm admiration for the character of a heroic (but unfortunately fictitious) individual named Dimitri Papodoodlekos-or something to that effect - an Armenian gentleman of enlightened views and stiff moral fibre, who, having been converted late in life to the principles of Wesleyan Methodism, had persisted, in the very heart of the Ottoman Empire and in the face of all Islam, in maintaining and practising the tenets of his newly embraced creed until summarily deported from his native Armenia by direction of the Sultan himself. The writer begged to enclose a small contribution toward the sum of fifty pounds which she understood the Brotherhood of Kind Young Hearts was endeavouring to raise, in order to set up the expatriated Papodoodlekos in a cigar-divan in Stoke Newington.

The next letter contained a postal-order for one pound, contributed by a warm-hearted but gullible female in Leicestershire, as a contribution toward the sum required to purchase a dresssuit for Samuel Mings, the Walthamstow garrotter, who, having recently completed a term of fifteen years' penal servitude, was now anxious to atone for past misdeeds by plunging into a life of intense respectability. Samuel, it seemed, had decided to follow the calling of a waiter at suburban dinner-parties, and, being a man of agreeable address and imposing appearance, had already booked several conditional engagements in the Golder's Green district. A second-hand dress-suit was now all that was requisite to ensure for him a permanent residence in the paths of virtue. It may be mentioned here that sufficient cash to equip Samuel with an entire Bond Street trousseau was yielded by this post alone.

But the begging-letter writer, charm he never so wisely, draws a blank sometimes. Presently Uncle Joseph picked up a large gray envelope from the heap. 'Man's handwriting,' he observed. From the envelope he extracted a letter and a cheque. A casual glance at the face of the cheque caused him to raise his eyebrows comically and whistle. Then he skimmed through the letter. 'Here's a fellow with a sense of humour,' he said. 'What a tonic after all these women!'

'Sir,—My wife, who occasionally permits me to take charge of her correspondence, especially when she is asked for money, has handed me your very interesting communication. I learn from it that the International Brotherhood of Kind Young Hearts is in need of funds for fifteen different objects, prettily described by you as "this week's List of Mercy." The list includes:

'(1) Appeal on behalf of an Armenian undesirable, who appears to have evaded the immigration laws of this country, and so planted

himself in our unhappy midst.

'(2) Appeal on behalf of a retired garrotter, who, before setting up in business as a suburban burglar, evidently desires to study the architecture and internal arrangements of the residences

of our wealthy bourgeoisie.

'(3) Appeal for a sum sufficient to send one thousand slum children to the seaside. This appears to be a laudable object, though it is perhaps undesirable to despatch children of that age and condition to the seaside in early December, as you apparently propose to do. It would, moreover, have established greater confidence in the minds of your clients if you had mentioned the name of the slum, the name of the watering-place to which you propose to send the children, and the nature of your arrangements for conveying and maintaining them there. But perhaps, as in the case of John Wesley, "the world is your parish."

'There are twelve other appeals of a similar nature, all equally hard to resist, and all equally entertaining. Subscribers, I note, are requested to place a mark opposite the particular item of your programme to which they wish their contribution to be devoted. I confess I find my sympathy excited less by some of the appeals than by the others. For instance, I fear I cannot support your view of the desirability of providing a one-armed protégé of yours, Albert Edward Skewby, with a hurdy-gurdy. In my opinion there are only two musicians in history—Bach and Tchaikowsky—and neither of these sounds to advantage on a hurdy-gurdy. Besides, Albert probably has another arm inside his waistcoat. You look and see. Neither can I

find it in my heart to support your Home of

Rest for Unwanted Doggies. Sausages are dear enough as it is, and if you are going to corner the market in this well-meaning but misguided fashion, I fear they will soon be out of my reach

altogether.

'However, some of your other appeals moved me deeply, and I confess I have experienced great difficulty in making my final choice. was strongly attracted at first by the case of the gentleman who has just terminated a protracted visit to an inebriates' home, and who, I gather, is anxious to raise a sum sufficient to enable him to qualify for readmission at an early date. I nearly succumbed, again, to your appeal on behalf of the lady who has recently been rendered a widow by reason of the hasty and ill-considered action of a band of African cannibals. second thoughts, however, remembering that the pangs of the good lady over the loss of her husband must be as nothing in comparison with those of the unfortunate savages who are probably still trying to digest him, I held my hand, and passed on to my final choice—the purchase of an annuity for the aged and badly used butler, Lemuel Bloote. (What fun it must be making up names like that!)

'Lemuel, I gather, has severed his connection with his employer—a nobleman to whose family and person the Blootes have been faithfully attached for more than forty years—owing to an unfortunate misunderstanding with regard to a valuable and massive service of Sheffield plate, unaccountably missing from the baronial strongroom. Lemuel naturally left the court without a stain upon his character, but wounded pride forbade him to re-enter the service of his aristocratic traducer. Too old to start life afresh, too self-respecting to beg, he has thrown himself, you say, upon the compassion of the International Brotherhood of the Kind Young Hearts. I cannot resist this appeal. I set my mark against the name of Lemuel Bloote, and beg you to be so kind as to accept my cheque on his behalf. I do not know how great a sum is required to purchase an annuity for a Bloote, so I leave the cheque blank. Kindly fill it up at your discretion. I make only one stipulation. I am a collector of Sheffield plate. If Lemuel has not already disposed of his stock, perhaps you will kindly put me into direct communication with him.

'Let me close with a word of advice. When you write your next batch of appeals, do not allow your sense of humour to run away with you altogether. I admire and respect a cheerful knave; but let there be moderation in all things.

—Yours faithfully, Julius Mablethorpe.'

The cheque was headed 'Bank of Expectation,' and bore the somewhat unexpected signature of the head of the house of Rothschild. It was drawn to the order of A. S. Windeller, Esq., and was dated the 1st of April 2013.

'I should like to meet that fellow,' remarked Uncle Joseph appreciatively.

'So should I,' said Philip.

His uncle looked up. 'Hallo!' he said; 'is your sense of humour beginning to sprout, Philip? You are growing up, my boy. How old are you?'

'Nearly fifteen,' said Philip.

'Well, you don't look it, but you possess certain attainments which a young man of thirty might envy. In many respects you must be considered backward. But you are an excellent secretary, you can keep accounts, and you are exceptionally well up in English literature and modern science. I have directed you to the best of my ability in the right way of life. At any rate I have kept you away from wrong influences. You are healthy in body and prompt in mind, and you are thoroughly inoculated against the female virus. Now that your sense of humour is developing, you should go far. But we are wasting time. Let us polish off Aubrey Buck's correspondence, and then I will dictate to you one or two new letters which I have drafted. Your attention appears to be wandering. What are you thinking about?'

'Nothing in particular, Uncle Joseph,' said Philip. He took up his pen briskly. But, for all that, he had been thinking about something in particular. Uncle Joseph's reference to the female virus had brought it to his mind. It was a little girl in a blue cotton frock.

(Continued on page 21.)

SOME BARGAINS IN BOOKS.

AROUND MY SHELVES.

By E. BERESFORD CHANCELLOR.

Still am I busy books assembling, For to have many is a pleasant thing. BRANDT'S Ship of Fools.

IT is often regarded as a matter of despair by the book-collector that he cannot nowadays pick up the bargains with which earlier bibliophiles were able to crowd their shelves. The virtue of the 'twopenny box' is no more; the unconsidered trifles of the stalls have all fallen to the lynx-eyed Autolycuses. Even the lumberrooms of old country houses fail to reveal the treasures they once gave up to the rummager in their dusty recesses; and if, perchance, there be still such unexplored regions, it is ten to one but that

the saleroom claims them, and in the saleroom, 'tout se sçait,' as Montaigne remarked. when the Harleian Manuscripts were discovered hidden away in a false ceiling, when Mr Dyce picked up quarto Shakespeares for a few shillings, when the great Heber snapped up innumerable rarities for an old song, are gone with the Booksellers' Row of yesterday. Thus the depressed collector reads anew the tale of bargains secured in the good old days; and it is the commonest of common remarks that one can never pick up such things now. This to a great extent is true; but, like all generalisations, it admits of qualifications. Indeed, most of us can number among our bookcollecting friends several who point out with pride some treasures which have fallen to their guns; some woodcock, so to speak, which the other man has missed. One does not, of course, include in such small shoots (to carry on the metaphor) the millionaire who has battues, his two loaders (or book-agents), his battery of hammerless ejectors (otherwise his banking account) to bring down the quarry. Such men can't miss; their bag is always a heavy one—so heavy, indeed, that they probably hardly know what they have shot. No; the real collector is he who, like Charles Lamb, gloats over his prey, and only secures it after self-denial; to whom the acquisition of some rarity is a delight, and its contemplation a perpetual joy. To such as these, bargains, even rarities, are possible, and the book-lover may take heart of grace from some slight records of finds by one who is the least among this devoted band.

In earlier days I bought books because they were curious or had nice bindings, or for some such indefensible reason; now I purchase my literary pabulum as nourishment rather than as decorations. It thus happens that my trouvailles are largely to be traced to a period dating some twenty-or is it thirty?-years back (eheu fugaces /), although, like Stradivarius, I have 'an eye' still, and only last week picked up something. But this is a too recent joy to be transferred to cold print. What I mean to say is that these things, in spite of the grumblers, do still happen; you only require two conditions: a quick eye and a knowledge of what is what, and it is surprising how quickly you get into your stride in such matters. Once I collected first editions of Dickens-not very judiciously, I fear; but the result is a bookcase filled with the immortal works, together with a large number of what booksellers call 'Dickensiana.' I think I got most of mine reasonably, and I know I did not pay too much for the first Pickwick, with all the extra plates, and containing all those 'points' on which Mr Percy Fitzgerald and Johnson and Dexter and Kitton have waxed eloquent; while my Sunday under Three Heads was certainly a bargain. The shop at which I secured it has long since closed. How could it flourish when it permitted such a sacrifice?

But it is not about Dickens (whose books have, to tell the truth, been written up for all they are worth, intrinsically speaking) that I want to gossip for a little. I look through my shelves at random, and I find Bret's magnificent (1773) edition of Molière, with Moreau's plates, the masterpiece of that wonderful illustrator. My copy is in the original calf. This chef d'œuvre fetches a large price—a copy in morocco was purchased at Christie's for thirty-two pounds, and was on sale at a bookseller's later for one hundred and eightyfive pounds. Morocco binding, if original, makes all the difference, curiously enough, in the price of this book; but the humble two pounds I gave for my example, which is as fresh as when published, and has the starred pages, &c., may certainly be regarded as a bargain. So may my genuine first edition of the Eikon Basilike (1648), without printer's name or place of publication. My copy is not in very great condition, nor does it contain the rare errata slip; but a couple of shillings can hardly be called excessive for what is a very scarce volume. No fewer than forty-six editions of this much criticised work came out during the first twelve months, and this does not include three in Latin, four in French, one in Dutch, and one in German. I find several other editions among my books, one of the rarest being the French translation by Porrée, printed at Rouen by Jean Berthelin. Almack, the great authority on 'the king's book, knew of but two perfect copies, and he devotes five pages to the consideration of this edition in his monograph. My copy is bound by Rivière in whole morocco, and is curious for another This fine and careful binder has here wrongly lettered the book, which bears on its back this legend: 'Milton—Eikon Basilike. Trd. par Porrée.' A curious mixture of the 'White King's' book and that of its critic, whose Eikonoclastes is here dimly adumbrated!

The mention of Charles reminds me that I once collected books concerning that monarch and his times. Many of these are now priced much higher than they were in the days when I gathered them, and some of those fugitive tracts—I think the great collection in the British Museum, of which Macaulay made so much use, numbers some forty thousand—are of the greatest rarity. I picked up, for a shilling, I remember, the little four-sheet brochure entitled Mistres Parliament Brought to Bed of a Monstrous Child of Reformation, which was scarce enough even in 1809 to cause Grose to reprint it in his Antiquarian Repertory. Bound up with this I have His Majesties Gracious Letter from Breda, read in the House of Lords on the 1st of May 1660, promising reforms which were hardly fulfilled; and in the same volume is The Form and Order of the Coronation of Charles II., King of Scotland . . . as it was Acted and Done at Scoone, the first day of January 1651. This is the edition printed and published at Aberdeen

in 1660, before it was possible to publish it in Both these tracts cost me but a few London.

I paid a sovereign for Hobbes's Leviathan (1651); but, then, it is not only the first edition, but the first issue of that edition, as distinguished by the brilliance of the engraved frontispiece, the lines on the sword, and the correct spelling of the printer's name (Andrew Crooke) on the title-page; and, besides, has Faithorne's portrait of Hobbes inserted.

But a far greater bargain was Robert Parsons's Conference about the Next Succession to the Crowne of England (1594), which is not only a fine copy, very carefully rebound, but has the genealogical table which is nearly always missing. shillings and sixpence secured for me this rare and curious work, in which the author supports the claim of the Infants of Spain to the throne of England after the death of Elizabeth. It was published by R. Doleman, but its real authors were Robert Parsons, Cardinal Allen, and Sir Francis Englefield. The printer is said to have been hanged, drawn, and quartered, and it was so rigorously suppressed that it was made high treason even to possess a copy. Another book, of about the same period, which has a curious interest is Bizari Opuscula (1565), containing poems by this Italian, who dedicated one part of them to Elizabeth and another to Mary Queen of Scots, and thus determined to be on the side of the angels at any cost. My copy of what is a rare and valuable book once belonged to Lord John Russell, and cost me (I bought it in a lot with others) on the average one

I possess, too, a copy of Sturt's wonderful engraved Prayer Book of 1717, in a beautiful contemporary binding, and containing the movable circular dial which is nearly always missing, as collectors know. If I cannot claim this as a bargain, because it was a gift, it at least did not cost me anything. The history of this production is curious. It was wholly engraved on silver plates (containing one hundred and fifty of biblical subjects, portraits of George I. and the Prince and Princess of Wales, &c.), not a word being printed. At first it did not sell well, and it was therefore determined to take off a number of copies privately, and then to destroy the plates publicly. After this the hoarded copies were brought out gradually and sold one by one as particular favours, and the engraver was at length enabled to recoup himself for his expenditure of time and trouble.

Next to the Prayer Book, the Imitation of Christ comes appropriately. It was only recently that I picked up the rare Elzevir edition without date (a reproduction of the engraved title-page is given in Andrew Lang's The Library, in the chapter on Elzevirs) for a few shillings. Elzevirs, as collectors know, largely depend on their height in millimètres for their value. My Imitatio, I

am glad to say, is of a very satisfactory tallness, and is besides one of those productions of the famous press which is a rarity on its own account. not to be compared with the Pastissier François or the Aimable Mère de Jésus, of course, but still a rarity, and the day I snapped up my copy I consider a red-letter one. Speaking of Elzevirs, I purchased a good many, in Paris, in the 'eighties. These had belonged to M. Willems, who wrote a book on the subject, it will be remembered, and contain illustrative notes in his autograph. It was in Paris, too, that I picked up the counterfeit Elzevir edition of Péréfixe's Histoire de Henri IV. for a couple of francs, which, with my 1661 edition (bound by Bozerian) and that of 1664 in original vellum,

forms a pretty little group.

Another French book which is curious for more than one reason is a twelvemo volume entitled L'Art de Mettre sa Cravate, par le Baron Emile de l'Empése. This has a number of plates showing the various methods of tying the stock, and a coloured frontispiece of 'Le Baron' by Monnier. But its chief interest lies in the fact that it was printed, in 1827, by Balzac at the printing-press which he set up, and which is so graphically described in Illusions Perdues. It bears the imprint, 'Imprimerie de H. Balzac, Rue des Marais, N. 17;' and it cost me two-

pence!

Space forbids me to enlarge on the mouthwatering (so to term them) prices at which I have secured copies of books from private presses -Strawberry Hill, Lee Priory, &c.; but one I must specify—namely, the Translations from the German by Miss Cornelia Knight, lady-in-waiting to the Princess Charlotte, whose autobiography is well known. This was printed at the private press at Frogmore for Queen Charlotte, by E. Harding, in 1812. It bears a frontispiece of Frogmore Lodge, and is one of thirty copies issued for the use of the queen and her intimate friends. Of Pickering's Diamond Classics, too, I have a complete set, including the rarer of the two editions of Horace (with portrait instead of Stothard's plate subsequently used), and two copies of the Virgil, of which only a hundred escaped the fire at Corrall's printing establishment. For these two volumes I paid less than for many of the commoner ones. But, then, so many booksellers are ignorant of the value of books!

I have little room to speak of one of the most interesting byways in book-collecting-I mean such books as bear the autographs of former notable possessors. In this direction one has frequently a good chance of snapping up bargains, as such things often escape the eyes of booksellers who do know the intrinsic value of their wares. This was the case when I secured Bubb Dodington's Diary-a common enough book in itself, containing the Holland House book-plate, manuscript notes by the first Lord Holland, and in-

numerable marginalia, with a long account of Dodington contributed to the European Magazine for June 1784 by Horace Walpole, to whom the volume originally belonged—for four shillings. Also must I put down to a bookseller's oversight the fact that I bought Andrea Maffei's translation of Moore's Loves of the Angels—the identical copy which he sent to the poet containing a long letter of admiration. Moore, in his diary for June 1835, notes receiving it, 'accompanied by a letter from the translator addressed Per l'illustre e nobile Signor Tommaso Moore, and full of all sorts of flattering things about my divino poema.' Two shillings was hardly a high price to pay for this, was it? especially as it contains Moore's book-plate as well.

That various works I have by 'Orion' Horne should prove to be presentation copies is not so surprising, as that sadly forgotten writer was a great giver of his own productions; but a presentation copy by Matthias (almost as much forgotten as Horne) of his *Pursuits of Literature* is not so common. Mine was sent by him, with a Latin inscription in his unmistakable handwriting, to Beilby Porteous, Bishop of London,

who in a note on the title records receiving it; so that this volume, for which I gave sixpence, has a double interest in bearing the autograph of two celebrities. The Aldine edition of Aulus Gellius (1515), once belonging to Lord Byron, and bought by a former owner at the sale of the poet's effects on 6th July 1827; a volume of Marchmont Needham's Tracts, with Isaac D'Israeli's book-plate and autograph notes; Jeremy Bentham's copy of Rousseau's Contrat Social (the rare Amsterdam edition of 1762, there printed because prohibited in France and Switzerland), with his autograph signature; a presentation copy of Ion from Talfourd to the Lord Commissioner Bosanquet; Henry Thomas Buckle's copy of Harris's Lives of the Stuarts, having the book-plate and autograph of the author of Civilisation in England; and the Barbou edition of Juvenal which belonged to Henry Reeve, the editor of the Greville Diaries, and in which he has written: 'Juvenal raked up the rottenness of vice, but Persius cleft the putrid hearts of vicious men'-these are among the volumes which have come into the landing-net of a rather catholic-minded angler.

ROSEMARY COURT.

By FRED M. WHITE.

CHAPTER I.

MADAM sat in the rose-garden of The Court, darning a piece of fine old lace with the infinite pains that goes with all true artists. She sat there in the sunshine amidst the roses that she loved so well, and the perfume of them seemed to rise as if to do her homage. There were grass paths leading from all directions toward a sunken garden filled with wondrous turf, and in the centre of this were old flagstones and the quaint sundial which had told the time there for six hundred years. Amongst the immemorial elms behind was the house itself, a long, low Tudor structure of ripe brick, painted in wondrous blends of purple and orange and warm brown by the brush of old Time himself, the most perfect artist in the world.

It was not a great house in the common sense of the word; indeed, at one time it had been the residence of Dowager Mesdames St Bruyere before the castle had been destroyed by fire, and never been rebuilt for the cold, practical reason that the castle had been uninsured, and there were no funds available to restore its blackened glories. The reigning head of the House of St Bruyere for the time being accepted his loss with polished philosophy and exquisite goodnature, for his affliction was tempered by the knowledge that most of the family treasures and heirlooms, to say nothing of the priceless old furniture, had been saved. The Court was a

charming and delightful house, with its artistic simplicity blended and mellowed in the mortar of time with that nameless atmosphere which goes wherever the innate sense of the beautiful is found. It was a house full of ghosts and traditions and memories; not the ghosts that drag their chains, but the spectres of dead and gone St Bruyeres, fair women and brave men who had made history or writ their story on the pages of romance.

For at one time the St Bruyeres had been very great people indeed, beginning with old Brian of that ilk, who had been so prominent a figure in that highly successful argument between King John and his barons at Runnymede. It mattered little that the demesne of Rosemary Court to-day extended merely to a few farms and the house itself; for the fact remained that the St Bruyeres were still the salt of that particular earth, and that the ancient lady darning her cobweb-like lace in the sunshine regarded herself as the equal, if not the superior, of any monarch who ever sat upon a throne. It is a great thing, of course, to be the head of a House like this; but when one happens to have been born an Endellion as well, then one can understand a certain complacency of outlook and the calm assurance of one's unassailable position. For Madam St Bruyere—every reigning mistress of Rosemary Court was invariably called 'Madam'

-was a survival, a fast disappearing type of grandes dames. She inherited all the high traditions of the Courts of Old France. One could imagine her at Versailles or St Cloud in the time of the Louis, could imagine her as painted by Watteau or Bourchier; and even as she sat there now she made an exquisite picture in an exquisite frame.

She was quite old, seventy years of age at least, but there was no wrinkle on the olivetinged ivory of her cheeks, her dark eyes had all the fire and sparkle of youth, and the abundant masses of her white hair gleamed like spun silver in the sunshine. She looked as if untouched by the hand of care or trouble, as if there were no such thing as sorrow in the world. She looked like the absolute queen of this fair demesnewhich indeed she was; for, strange to say, the family property had never been entailed, so that it had gone from one generation to another, being for the time the absolute property of the head of the House. In the ordinary course of events Rupert St Bruyere would have been chief of the clan, with Madam an honoured guest under his roof; but until Madam was no more it was Rupert St Bruyere who was the pensioner. He made no demur, gave no sign of rebellion; he merely acted as a sort of second in command whose duty it was to carry out the mandates of his sovereign. He had his own ideas, of course. By some strange freak on the part of nature he had been endowed with a practical vein which caused him now and again to kick against some of the edicts from the throne. He took a keen interest in the land and its responsibilities, and was an expert in forestry; and, sooth to say, had little patience with the methods of some of the tenants. It was all very well that Giles or Hodge should be forgiven his rent again and again for the simple reason that there had been a Giles or a Hodge on that particular farm for centuries. This sort of thing was magnificent, but it produced no money for repairs or the upkeep of the estate, and it was only Rupert and the steward who could see the family revenues decreasing year by year. What Madam did with her money no one knew and no one dared to ask. She kept her own books and transacted all her own correspondence with the family lawyers in London. For all Rupert knew to the contrary, the Rosemary Court estate might have been mortgaged to the uttermost farthing. Beyond doubt Madam was a queen ruling over her small territory as if it had been an absolute monarchy.

She sat there weaving her needle in and out, to look up with a gracious smile presently at the neat maid in the mob cap who brought her a letter on an old silver salver. It was a letter bearing a French post-mark, and addressed to Madam St Bruyere in a crabbed, neat handwriting which suggested the scholar and recluse. In a slow, deliberate way Madam read her letter, and as she did so the warm ivory tinge on her

cheeks faded to a dull white, and for a moment or two she looked very old and tired.

With a hand that trembled slightly she struck a gong on the table at her side, and requested the answering servitor to bring Mr Rupert to her at once. He came a moment later, a tall athletic figure of a man, a typical St Bruyere, clean-cut and haughty of face, a little dreamy about the eyes perhaps, but the chin was firm and square, and the flexible lips suggested a sense of humour. He bowed over Madam's hand and lifted her fingers to his lips.

'I sent for you, Rupert,' she said. 'Something quite unexpected has happened. I should like to hear your opinion of this letter. Your advice, of course, I am not seeking. Please read

it aloud.'

Rupert took the thin sheet of paper.

'AMYANS, FRANCE

'Esteemed and respected Madame,-It is my sad duty to inform you that your daughter Madame Parcourt died, and was buried in my cemetery here three days ago. For some time past she has been here confined to her bed with a disease from which finally she succumbed. Of course I knew her as an actress charming and most distinguished; but it was not until the end that she realised what was coming and she told me her sad history. It is not for me, dear madame, to comment on the estrangement between you, for that is no business of mine. I understand that between you and your daughter since she left your roof to marry Monsieur Parcourt no communication has passed. In what you call the ordinary way, I would trouble you no further except to send you the effects that Madame Parcourt left behind her. I know her for a pure and good woman whose life has been one long unhappiness and sorrow. For many years she has made for herself here the annual vacation. All here knew her and loved her, as they now love the child she left behind her.

'And this is your daughter's secret. Cécile is nineteen now, and up till two years ago was educated here by the Sisters of the Convent of the Sacred Heart. She is a young lady the most lovable and beautiful. She is calculated any position to adorn. For some two years she has followed her mother's profession, but now that she is alone in the world all this must cease. I shall, therefore, dear madame, esteem it the great favour if you will favour me with my instructions, so that I may make arrangements for your granddaughter to come to you at once.

'With great respect, Madame, 'PAUL CARTIER, Curé.'

'Astounding!' Rupert exclaimed. 'I never dreamed of this. You want me to go over to Amyans and bring this girl back?'

'What! bring her here?' Madam asked. 'Bring the child of a strolling player to Rosemary Court? Have the old scandal revived afresh? You must be dreaming, Rupert. When I have got over the shock of this discovery I may ask my solicitors to provide for this child if she makes no claim.

Rupert's lips tightened. The inevitable hour was here at last. It had been bound to come

sooner or later.

'I cannot agree, Madam,' he said firmly. 'Beyond all question this girl Cécile must come

CHAPTER II.

MADAM ST BRUYERE laid a sudden hand upon her heart. Rupert could see the long, slim fingers trembling, and the uneasy shimmering of those old diamond rings. as if the painter's rag had been swept across a finely painted canvas, leaving a smear of chaos and ruin behind. For in those few quiet words Rupert had raised the flag of rebellion, and the red of it glowed faintly in his cheeks. For any one to be in direct antagonism to Madam was as the first swift step to Armageddon. Madam had ruled here all these years, none had ventured to question her slightest word, and yet with it all she had never lost the consciousness that it was a man's place to sway the destinies of that fair domain. She was surprised, shocked, and affronted; and yet at the back of that orderly, logical mind of hers there was sympathy for Rupert's point of view.

'Let us discuss it quietly,' she said. 'I have seen this coming for some time. Have you quite

made up your mind?'

Rupert's lips narrowed to a thin red thread. He sat there with his head thrown back, the outline of the old house a fitting background. There was a feeling in the air such as preludes a coming thunderstorm, though the sky was blue and clear.

'I think so, Madam,' he said. 'It could not be otherwise; I could not remain here if it were.'

'And what would you do, my boy?'

'I would go abroad. Since old Wymark died, and I took his farm into my hands, I have made a thousand pounds. With that I am sure I could see my way to success. Oh, can't you see that there is only one thing to be done? Your

grandchild must come here.

'I knew you would say so, Rupert. But surely you do not appreciate the terrible scandal. Your grandfather was a proud man and a brave one, but he never held up his head afterward. Just think of it! No girl in the world ever had a more careful bringing up than your aunt There was nothing a girl needed that Cecilia. she lacked. And I always thought that she was a true St Bruyere; a little too fond of gaiety, perhaps, but otherwise alive to the importance of her position. It was always my proud boast that I could trust my daughter anywhere; and yet the whole of the six weeks we spent on that

ill-fated visit to Scarborough that infatuated child was meeting the actor Reginald Parcourt daily, a mere strolling player, a man who for a mere wage played parts upon a travelling stage. It seems incredible!

Rupert smiled discreetly. On this point Madam's views would never change. An Irving on the one hand or a Bernhardt on the other could represent to her no more than a couple of acrobats clowning for coppers on a village green. Rupert had seen men and cities, and he could listen to all this with toleration.

'Parcourt was a man of good family,' he said. 'He had some of the best blood of Old France in his veins. The Marquis de Havant was a distant cousin of his. The man was a scamp, of course; but, socially speaking, there was nothing

against him.

'The man was a scoundrel,' Madam St Bruyere said, 'utterly without principle, and cast out from his family. Oh, I have no doubt that he was handsome and fascinating enough. How would my daughter have forgotten herself so terribly had it been otherwise? Ah, my boy, you cannot understand a mother's feelings. It all comes back to me now as if it had happened only yesterday. I can see your grandfather with that letter in his hand. We had just come down to breakfast. But I do not care to dwell upon it. Cecilia had gone off with her actor, and that letter was to say that they had been privately married the day before at a place which I think they called a registry office. Heavens, a daughter of mine in a registry office! Rupert, it is hardly a marriage at all.'

'The law recognises it,' Rupert said. 'Need we go into a theological discussion upon the point?

Legally speaking'

'Oh, I know, I know,' Madam said impatiently. 'In the eyes of the world everything was correct. And from that day to this Cecilia has been to me as one dead. I did not seek to know what she was doing, but I could not help hearing things: from time to time. Cecilia had gone on the stageherself. As was the case with all the St Bruyeres, her French was perfect. I understood that she became very popular in Paris. I did not want. to hear anything, and yet all the time I was hungering for news. And then there came that terrible scandal in which Parcourt and the Marquis de Havant were mixed up. I knew Parcourt was a bad husband, that he neglected his wife, and was actually cruel to her; and I knew from some of my gossips that De Havanthad fallen in love with Cecilia, and was following her from place to place to protect her from the man for whose sake she had sacrificed so much. Then I heard it said that Parcourt had threatened his cousin, and that friends had to interfere to-prevent bloodshed. You know what happened, You know that in a fit of madness De-Havant murdered his cousin and committed suicide after. And here was I, a lonely widow

who had done her best to live a life beyond reproach, the mother of the most notorious creature in Europe! It hurts me to speak of it. Never have I mentioned this dreadful subject before. I know that your father told you, and that you were forbidden to mention the scandal in my presence. How can I put any but one construction upon my unfortunate child's conduct? And now I am asked to find a home for a child, to take to my heart a girl, of whose very existence I was profoundly ignorant an hour ago. What am I to do?'

'I am more than glad you have spoken to me like this,' Rupert said. 'It was not for me to introduce the subject; but, now you have done so, let me tell you that you are entirely wrong in nearly all your facts. When I was in Paris in the spring I saw a good deal of the present Marquis de Havant, and he showed me the correspondence which had passed between his brother and himself with regard to Cecilia Parcourt. Madam, if you saw those letters you would say that Hugh de Havant was one of the noblest and finest gentlemen who have ever adorned the nobility of France. There were letters, too, from Cecilia Parcourt which brought the tears to my eyes. She was a desperate and unhappy woman who recognised in Hugh de Havant a true friend. That he had won her heart was beyond question; that she possessed his there is no doubt. The world would be a better place if it could see these letters, or some of them. What would you say if you were a man, and the woman you loved came to you in the dead of night pursued by a fiend who had sworn to love and cherish her? What would you do if you saw her with the blood streaming down her face? Oh, I can't go on! And that is why Hugh de Havant challenged Parcourt to a duel, and killed him next day in the woods at Fontainebleau like the dog he was. De Havant may have been wrong to take his own life afterwards, but who are we to judge? It was an act of medieval chivalry, his way of keeping clean and sweet the good name of the woman he loved

only too well. I cannot see the breath of scandal has ever really touched my aunt Cecilia. And even if it had, why should you vent your displeasure upon the head of an innocent child?

For a long time Madam sat there, looking with dim eyes down the avenues of the past, for Rupert had shaken her to the centre of her proud and—because of her pride—unnaturally selfish soul. He spoke, too, with the air of a man who had made up his mind to dominate the situation. Not for a moment did Madam doubt that Rupert had told her no more than the simple truth. But the old prejudices, the old shibboleths and social idolatries, were too strong to be overcome by mere force of argument. After all, this child was tainted with the stage; she had danced no doubt in the glare of the footlights for the amusement of the canaille in many a theatre. And this was the granddaughter of the chatelaine of Rosemary Court!

'I hardly know what to say,' Madam murmured. 'For the first time in my life I am in need of advice.'

'No advice is needed at all,' Rupert said.
'Unless that child comes here I cannot possibly remain. She must come here, Madam; she must be assured of a warm and a generous welcome. Do not forget that some of the proudest blood in England and France flows in her veins. And with that I have finished.'

Again there came no reply from Madam St Bruyere. She looked up, and saw the old house in the distance; she saw the swallows under the wide brown eaves, the moss-grown sundial, the Dutch garden with its red tiles, where dead and gone St Bruyeres had gossiped and made love in the dim, dead centuries; and into her heart there crept once again the mother-love, the desire to see again the daughter whom she had lost and mourned so passionately.

'When shall you go to Amyans?' she whispered.

The tears were in her eyes as Rupert raised her hand and kissed it.

(Continued on page 25.)

THE SUPPRESSION OF THE SEPTGO HINGTL. THE ADVENTURE OF THE 'FEMALE DEMON.'

By W. F. BATTEN.

PART I.

IT has occurred to me that some of the many readers of Chambers's Journal might like to know how the sanguinary secret society of the Seven Pirate Captains was suppressed, and its chief leaders brought to justice. It will also incidentally afford yet another instance of 'truth being stranger than fiction,' as well as that 'murder will out.' I must, however, before commencing my story, briefly explain how I came upon the scene.

In the early 'seventies of last century, the Admiralty, being seized with a sudden fit of economy, had sapiently decided that it would much decrease the coal-bills of the little and slow old gunboats attached to the China squadron if they were ordered to cease cruising after pirates; 'My Lords,' in the innocence of their hearts, believing that the Chinese Government—if politely requested to do so—would gladly take over this troublesome and coal-consuming

work! Besides, I personally had an account to settle with these murderous desperadoes for the massacre, under most revolting circumstances, of the officers and crews—including the captain's wife and the stewardess on board one of them—of two European sailing-vessels that had sighted Hong-kong in company with our own when I first arrived in the colony.

This I had not forgotten a few years laterabout the time of the coal-saving order-when I found myself in charge of the John Adams, better known as the armed water-police chop, then the headquarters of that force in Hong-kong Harbour. The crew of the *chop* consisted of some sixteen Europeans, armed with Snider carbines and sword-bayonets, who were in charge of the patrol-boats and about one hundred and thirty Chinese lukongs (boatmen and sailors) who composed their crews; these carried boardingpikes, certain picked men having revolvers. There were also a small sailing-vessel of about seven tons and a native craft of about three times that size; a long, smooth-bore, brass six-pounder and two three-pounders composed their armament. There was at this time but one official steamlaunch in the colony, which was for the use of his Excellency the Governor and of the harbour-master, the late Captain Thomsett, R.N.

It happened just then that the after-effects of a severe attack of malarial fever, combined with fever and ague, had compelled me to apply to the chief of my department, Captain Dtransfer to the little seaside town of Stanley, at that time the sanatorium of the island. Stanley Harbour lay toward Myers' Bay, famed for the numerous piratical attacks that took place off or near it. Before I left headquarters, however, my attention was called to the Piracy Record by a fresh case just reported; and whilst searching this volume I was suddenly struck by the fact that for several years past the majority of the piracies reported, and all the more sanguinary ones, seemed to have been committed by the same class of craft and in the same way; the pirates, after murdering every soul on board, usually scuttling the vessel in order to leave no clue behind them. But though 'dead men tell no tales,' men left for dead, when the sinking craft had been sighted by a passing vessel in time to take them off, could and did; hence the existence of a Piracy Record. These reports of piratical attacks had in the last two or three years numbered nearly fifty a year, and of course there were many others unreported when not a single soul had survived.

No sooner did I obtain my transfer to Stanley Harbour than I commenced my investigations, there being but little official work for me to do there. During the season the harbour was much frequented by native craft, especially fishing-vessels, whose crews certainly saw almost all that went on both in colonial waters and on the adjacent coast of China, and as certainly never

would speak of it—a state of things I intended to alter. This was because pirates leave fishermen severely alone, lest the large armed vessels of their 'guild' should avenge any wrong done them.

I had not been very long at Stanley before a Shantung seaman who was an experienced pilot was brought to my office in the barracks ashore by my interpreter to report that he had been kidnapped by the Hingti pirates, and detained for several months on board one of their vessels. because they needed a pilot who knew a part of the coast with which they were not familiar. This report was the direct result of my having gained the confidence of his class, the tankurs (seafarers), probably the most ignorant, taciturn. superstitious, and obstinate type of humanity in all the seven seas; otherwise wild horses would not have dragged him to the Harbour Office. He stated that the pirates having ventured to anchor close to Cape d'Aguilar, he had chanced the sharks and swum ashore in the dark. the man declared, and probably truly, that his life was in danger from the pirates, who would silence him at all costs, I took him as an extra hand into the harbour department boat, thus securing a most important witness and much valuable information as to the pirates' lurkingplaces and methods.

This man's story was certainly a most astonishing one, for he declared that the two leaders of the Hingti (the Brotherhood of the Seven Pirate Captains) were a 'female demon' and a Macao-Portuguese, a 'small official.' Their craft, he stated, always attacked in pairs, two or four vessels together, but these never contained less than a hundred pirates; whilst this dangerous secret society could, with the snake-boats that put off from the land, muster altogether two or three hundred men at least. Two of the seven craft were usually refitting or cleaning and oiling their bottoms on shore, whilst the seventh was engaged in lawful pursuits only, and thereby was enabled to act as a spy without being suspected. Indeed, the other six vessels, when not out on a piratical cruise, had merely a crew of half-a-dozen on board, a couple of these men having their wives and children with them; and as these six men were never engaged in any armed attacks, they had no fear of being identified. Neither was there a scrap of plunder or a sign of armament ever to be seen on board; and their papers were always found to be in order. Thus, in the event of these vessels being stopped and searched by the commander of any British or Chinese gunboat, as sometimes happened, they could not be detained.

Needless to say, their appearance when engaged in a piratical attack was quite different from that which they presented on other occasions. This type of vessel was also very fast, and when full of men the craft could be propelled in a calm by means of their sweeps or long oars at considerable speed; whilst in light winds they never ventured more than about a dozen miles from the shore, so that on the first sign of a gunboat's smoke on the horizon they could slip into some convenient creek, and remain hidden there until the enemy had passed on and were out of sight. Hence these vessels ran little risk of capture in the ordinary way.

By patient questioning I extracted from the Shantung man the additional information that the 'female demon' was a very good-looking young woman, who had fairly earned her title by her daring and cruelty. She steered her own vessel, led the boarders, and superintended the massacre that always followed a capture. These acts, however, were not the cause of the terror that this young woman-believed to be a Macao-Portuguese half-caste-inspired. It arose from certain supernatural attributes which rumour had conferred upon her. Her confederate was also a half-caste, a 'small official' from Macao, named or nicknamed Semala; his officialdom consisting in his holding the post of pilot on board his Excellency the Governor of Macao's small gunboat—the Camoens, if I recollect aright -which post Semala doubtless found a very useful one in carrying on his non-official calling. The irony of the situation consisted in the fact that he was at times actually steering the Camoens on a cruise after himself or to recover his own plunder! But I have doubtless said enough to enable the reader to understand how this infamous confederacy in crime had been enabled for so long to run a successful course at the cost of many hundreds of lives and many hundreds of thousands of dollars' worth of

When, greatly owing to Captain Dinfluence, I succeeded in obtaining the required permission from his Excellency Sir Richard Graves MacDonnell to act outside colonial waters, I quietly made all my preparations at Stanley, out of sight of the pirates' spies. On pretence of removing my furniture and stores from Victoria, forty picked men were sent from the John Adams by water, and a six-pounder and two three-pounder guns, with small arms and ammunition, were smuggled out as 'furniture.' Stores and provisions for a six days' cruise were laid in at Stanley, where I also recruited a dozen good men who knew every inch of the coast for a hundred miles or so, and who, as ex-smugglers, would be quite at home in a tough fight. I likewise took my gig and her crew, the former to be concealed under light stuff on the native trader's deck. Still, all told, this was not a very large

force to pit against the pirates.

However, I could rely on my men, who were all volunteers; and I reckoned greatly on the advantages that good discipline, superior weapons, and the effect of a surprise would confer. any rate, unusual risks had to be run if success were to be attained. So I arranged with an old acquaintance, a native merchant, to charter, on my account, the new Stanley 'fast-boat,' thus called because she was built for speed in light winds, and in a calm could be propelled by sweeps. The old one had been at times chartered for a like purpose, and had actually carried wealthy traders and valuable cargo up-coast, so that this would arouse no suspicion. Indeed, the old 'fast boat' had more than once shown a clean pair of heels to the pirates. On this occasion I intended that my men, in disguise, should be the 'wealthy traders,' and the bales of valuable cargo dummies, with some light stuff to hide the guns and the gig on deck; whilst, as my native friend had taken no pains to conceal the fact that the Fortunate Venture, as she was called, had been chartered by some wealthy traders, I had little doubt about her being attacked when she reached the waters the Hingti pirates infested. My good understanding with the tankars, too, enabled me to come to terms with the owners of two smart new fishing-craft, which were to be better armed and manned than usual, and were just to keep us in sight whilst apparently fishing, so that if disaster befell they might be able to pick up some of the piecesin other words, give the married men with me a chance of being saved.

Fortunately all three vessels were lucky enough to get clear of Stanley Harbour after dark without exciting any unwelcome curiosity. Then, as my men were completely played out with many hours of hard work, I merely retained half-a-score of them on deck to handle the sails and keep a lookout, and sent all the rest below to get three or four hours' sleep whilst we were in the neighbourhood of Hong-kong. Thereby we very nearly came to grief, for when we were passing Cape d'Aguilar there suddenly shot out from the black shadow of the high cliffs—the only warning the swirl of the seas flung from the sharp stems and the creaking of straining cordage—first one swift craft and then a second. As they swept past us they shaved our sides so closely that I feared they intended to run on board us; but in a flash, long before I could rouse my men, they had disappeared, completely engulfed in the

surrounding inky blackness.

Mad at being so nearly caught napping, I turned to the Shantung man, who was at the helm, and asked him if he had been able to recognise the strangers. 'Hi' ('Yes'), he remarked with a grin. 'My can savey he belong that Hingti.' 'Then why did they not attack us when we were so obviously unprepared?' I demanded. 'Because he was no ready either; he only look see if this ship come.' 'So they were watching for us off Cape d'Aguilar, then?' 'Yes. Now he have see you he go catch plenty more men. My think you more better take care to-morrow night, captain.' I thought so too, though I said nothing.

The next day passed quite uneventfully, the

Fortunate Venture holding well on her course with a beam wind. Our acquaintances of the previous night made no sign, though I felt sure that we were being shepherded somehow either by them or their confederates, but at a distance at which we could not distinguish their vessels from other craft.

I intended to anchor that night in what I had been told was the usual lurking-place of these pirates, the tiny landlocked harbour of Samun, the largest of a group of islands, mere lofty rocks, situated off the shore at Myers' Bay farthest from Hong-kong, from which it was distant about thirty miles. This rocky group used to be called the Ladrones' or Thieves' Islands by the Macao-Portuguese. Indeed, their inhabitants lived by piracy, smuggling, or coolie-catching for the barracoons at Macao; and I subsequently found that the only path which led into the interior of the island was commanded by six-pounder guns, because the pirates had storehouses there!

Samun's tiny harbour was indeed a veritable death-trap for the unlucky trader who entered it or was driven in by stress of weather. It seemed to have been scooped out of the rocky cliffs, and had a narrow main entrance from the

open sea, and another, a mere rock-strewn passage between cliffs, which was known only to the islanders and their piratical and smuggling associates. This passage led to the side of the island which faced the shore of the mainland, and it was through this tunnel-like passage that the piratical craft silently glided during the very darkest hour of the night, that which precedes the dawn, in order to surprise their prey whilst at anchor in the harbour. Samun was also a capital coign of vantage from which to watch for any European ship that was unfortunate enough to get becalmed so near the land on a dark night.

I had purposely timed our arrival for sunset, and just as darkness set in I let go the fish-hook (the native wooden anchor) in the very centre of the little harbour. The Fortunate Venture then only swung by a light grass cable, which could be severed by a single stroke of a sharp axe should we need literally to 'cut and run' to sea at a moment's notice. Then, after the men had been given their evening meal, all except the lookouts were allowed to lie down at their

stations on deck.

(Continued on page 29.)

SOME CONGO PESTS.

THE DRIVER ANT.

By the Rev. JOHN H. WEEKS, Author of Congo Life and Folklore, Among Congo Cannibals, &c.

THERE are some advantages in living in a country like the Congo. You can grow your own bananas and oranges; you can live an unconventional life, and need not trouble about visiting-cards; the house 'boys' have no difficulty in carrying out the bulk of your furniture on Saturday morning, and stowing it on the front veranda, while they wash the house through with bucket and broom; and one is never troubled with the drawing-room chimney smoking, for, in the first place, you will be extremely fortunate if you have even a sitting-room, and, in the next, there are no chimneys in the house, as fires are not required in a climate where the temperature never falls below sixty-seven degrees in the shade. These are a few of the compensations that reward the white folk for living near the equatorial line.

But there are some disadvantages that break the monotony of life; and although disagreeable at the time, they are subjects for conversation and laughter afterwards. It is midnight, and you are enjoying a sound and dreamless beautysleep, when you are aroused by the slapping of the cockroaches on the bamboo walls of your bungalow. It is not the first time you have heard these ominous sounds, and experience tells you that the ferocious driver ants have made an attack on your house. They have fastened on some unfortunate cockroaches that are now trying to shake off their enemies by flinging themselves against the walls, or, what is more probable, in blind panic at the attack they are trying to escape, and unheeding where they are going, and not gauging the distance and force of their flight, they are thus banging the walls.

On a small table by my bed I always keep a pair of thick woollen stockings, and, reaching out for these, I draw them up well over my pyjamas, and thus equipped I am ready to meet the emergency. The stockings are too thick for the ants to bite through, and the wool is too rough for them to climb easily—a very maze in which they become bewildered-so they are quickly caught and killed before they reach the thinner material of the pyjamas. I pass out of the bedroom, across the dining-room into the study, which is also our reception and drawing room, and light the lamp. Returning, I carry out my wife, and then our two small children, and place them on the home-made sofa, and cover them with a rug kept handy for the purpose. They rest perhaps doze off to sleep again, and I sit and read to pass the time away while the ants are busy clearing every living thing before

Just stand at the door of the bedroom, and by the light of the lamp left burning on the table

watch the scene. The walls are covered with ants; they drop from the roof on to dressing-table and washstand; they swarm over the mosquito-curtain, the wardrobe, and the trunks. The floor is almost brown with them. No living thing can stand against their onslaught. Lizards are being dragged away, beetles and cockreaches are being carried off, the rats and mice are scuttling away, and in two hours that room is as free of insects, lizards, beetles, and mice as if it were built only yesterday. scavenger ants are a blessing in disguise; but we should appreciate their kindly offices more highly if they would visit us at a more seasonable hour. During fifteen years of life among one of the cannibal tribes on the Upper Congo we had many visits from these ants-more than twenty; but we never knew them to come at any other time than between the midnight hour and 2 A.M.

Soon after two o'clock we return to bed, for the ants are now busy in other parts of the house, so they will leave our bedroom alone, since they never sweep through the same room twice in a visit, knowing well from instinct that they have swept it all too clean on the first foray for it to need a second.

In the morning, when we go to lay the table in preparation for breakfast, we find that the main army of ants has disappeared with their loot, but a regiment has been left behind in possession of our larder. The legs of the shelves holding our food are always standing in water; but the driver ants have sacrificed thousands of lives to form bridges; the tins of water are full of ants, and over the dead bodies of their comrades the living ants, laden with food, are passing to their nests, and others are hurrying forward to secure their loads. The meat left from the previous day is one moving mass of ant life. It seems chaos in miniature; but you can see the heavily laden ants struggling from beneath the others with their loads of meat. There is no malingering in their efforts to get at the food—not to eat it, but to carry it away to their own larder.

In despair, we take up the dish and make a dash for the open, where we deposit it on the ground. We have tucked our shirt-sleeves up well above the elbows, and as with the right hand we carry out the dish the ants attempt to rush up the arm, but we sweep them back with the left hand. How fortunate it was that we turned up our sleeves! Otherwise the ants would have run under the cuffs and swarmed over our bodies in an incredibly short space of time, and we should not have been able to strip quickly enough. I reckon that the man who has unwittingly stepped among some driver ants will undress more expeditiously than any other man on earth, for the strong jaws of every ant are an incentive to speed. It is marvellous that these ants, born and bred in Central Africa, should know the intricacies of European garments; but they make for the joints of its armour instinctively, and get to work directly they touch flesh.

We place the dish of seething ants on the ground, and make a clucking noise. The fowls hear the call; and, hurrying from all quarters, they set to work on the ants. Some of the ants escape to tell the tale of the huge enemies that attacked them with ruffled feathers and much cackling, but the majority fall an easy prey to the fowls. Everything is carried out from the larder, even the shelves and tins of waternow transformed into overflowing tins of ants-in which the legs stood; and when the cupboard is washed out with carbolic and water, then, and not till then, have we got rid of our troublesome night visitors. Troublesome? Well, not altogether, for we know it will be some time before we shall see another cockroach in the house, and for a week at least we shall not hear the lizards drop from the ceiling with a thud on to the table or floor, the beetles (heavy, hard-shell fellows) will not creep out of the thatch to fall with a sharp crack on the boards below, and it will be a week or more before the rats and mice will find sufficient courage to return to their old haunts and renew their forays on the candle-box and eggbasket.

On one occasion, while our house was being rethatched, we went to live in the schoolroom. It was well adapted for its purpose, but was unsuitable for a dwelling, as its single room had to answer for all purposes—study, dining-room, bedroom, &c. But we had not occupied our temporary quarters very long before we had a visit from the driver ants. We were aroused by the usual sounds, but now there was no study in which we could take refuge while the ants swarmed the place. Drawing on my thick woollen stockings and lighting the lamp, I considered what was to be done, when my eye fell on the dining-room table. The very thing! In a few minutes the legs of the table were standing in plates of paraffin, some blankets were spread over the table, and my wife and children were laid upon it, and made as comfortable as possible under the circumstances.

For more than two hours that night I walked around that table sweeping the ants away with a long broom for fear they would rush the moats of paraffin, and by making bridges with their bodies allow their comrades successfully to storm the table and turn its occupants into the cold night air. My sweeping operations were varied by picking off the ants that fell from the ceiling on to the improvised bed, or from my own head and neck, or by chasing an occasional ant that had mastered my woollen stockings, and was rewarding itself by digging its mandibles into my flesh. Ugh, how they nipped! What fierceness they put into every grip, what tenacity into every snap of their jaws! They held on as though they had lived and trained for nothing else than that

one bite, for only death made them relax their prey. It is some years since that night, but the memories of its discomforts linger with me still; and although I smile when I recall the figure I must have cut, in the lamplight, walking round the table with a long broom, yet the smile fades away when I remember how some ants, escaping observation, crept under the bedclothes and aroused the sleeping bairns by their savage bites.

At the back of our station we had a large, rough house in which, every night, we locked our goats and sheep to guard them from leopards and pythons; but neither locks nor bolts can keep out driver ants when a place comes in their line of march. Many a night have I heard in the distance the cries of the goats and sheep; and, knowing what they were suffering from the attacks of their savage little foes the driver ants, and their utter helplessness, I have left my warm bed, and, with a lantern in hand to show the path that I might not step on a snake, have gone and released the animals from their How they rushed out of the opened door, pens. stamping with their feet to shake off their enemies! I am sure that if they could have spoken they would have called out 'Thank you!' as they crowded pell-mell into the open field, where there was a possibility of escape from the ants. I can imagine no death more horrible than torture by driver ants; yet that was sometimes the agonising death allotted, under certain circumstances, to persons charged with witchcraft—to be securely fastened and thrown into a nest of driver ants. I am glad to use the past tense, for this does not happen now within the sphere of Christian influence on the Congo.

Driver ants are often to be met in their marches about the country in search of food. I have known them to be three days and nights hurrying across our station in one direction, and at exposed points, such as paths, the soldier ants -fierce fellows more than half an inch long-. made living tunnels with their bodies that the workers might journey in safety. Drop anything on the line, and the soldiers instantly scatter in all directions to discover the cause of the assault, and unless you have withdrawn two or three yards from the line of march they will find you, and attack you with such savage determination that they will quickly put you to rout. However, discovering nothing, they re-form the living tunnel, and the working ants, who in the meantime have not stopped for a moment their ceaseless journey, pass on with their loads. When the ant army has passed, you will notice that the hard earth is beaten smooth with the tread of their countless feet.

While itinerating about the country you will meet these ant armies, and the man at the head of your caravan will shout, 'Nsongonia!' ('Driver ants!'), and make a jump to clear the line of march of such a spiteful army; and every member of your caravan, including yourself, will jump on

coming to the point where the driver ants are crossing the path. If you are astride a donkey it will be wise to alight and hurry your animal over the line of driver ants, since if you remain on his back you will soon know that the beast has stepped right among the drivers, for they are not only making him frisky and uncertain in his movements, but they are biting you voraciously under your tunic. There is no cry more heeded on the road than the shout, in the native tongue, of 'Driver ants!'

Yet without the driver ant tropical Africa would be more unhealthy than it is, and possibly unfit for human beings. By a wonderful instinct these scavenger ants track the carrion—be it a dead lizard or something of larger growth—and in a short time it will have disappeared, and there will be nothing left to taint the air. That your house should happen to come in the line of march is unfortunate for you at the moment; but when the small visitors have gone your feelings are more those of gratitude than abuse, and the only quarrel you are inclined to pick with them is that they prefer the night rather than the day in which to perform their sweetening operations on your house.

A REMINISCENCE.

LET us take the quiet path that we took so long ago,

When a scarlet winter sunset flushed the sky;
And our footsteps lightly scattered the newly fallen
snow.

Which we thought was summer rose-leaves—you and I.

A frosty moon was rising, and the keen east wind blew cold,

And the open gate of home was far to seek;
Ah! young love heeds not distance, and the story
that I told

Brought a glow of warmth and colour to your cheek.

We had come to gather holly for the pictures in the hall

From a coral-berried tree on yonder hill;

But we made such sweet excuses to watch the shadows fall

That gray twilight found us empty-handed still.

And we knew the church-clock erred when it chimed the hour of eight

As we loitered home together through the gloom, So I snatched a blissful moment—and a kiss beside the gate

Where to-day we saw a Christmas rose in bloom!

You sigh, then sweetly say, 'Though our union has been blest,

Yet the golden morn of youth was very fair.'

Dear, the years must claim their toll, but I think
I love you best

Now that Time has sprinkled silver on your hair. E. MATHESON.

INDUSTRIALISM AND THE LAND PROBLEM IN THE SCOTTISH HIGHLANDS.

By A. NEWLANDS, M. Inst. C. E., Chief Engineer, Highland Railway.

TO-DAY the question of the extent to which emigration is depopulating the country districts of Great Britain is exercising the minds of all thinking men. Much alarmist nonsense has been written on the subject, and pictures of deserted villages and waste countrysides have been graphically drawn as coming realities; but while much of this can be discounted, it is none the less a fact that in certain country districts the flood of an abnormal emigration is having a very unsettling effect on their social and economic life.

In 1911 the number of emigrants who left Great Britain was almost twice what it was in 1880, and the total for 1913 is estimated at three hundred thousand. As many as three thousand persons have been known to leave Scotland in one day, and yet writers on the subject who try to see a silver lining in the cloud tell us of the benefits thus reaped by our colonies, and say that, except in Scotland, the rate of emigration is not higher than the natural increase in the population of the United Kingdom justifies.

We in Scotland, however, object to any such qualification; for, in so far as the Highlands of Scotland, at any rate, are concerned, we know that the leakage is quite abnormal, that it is more than a mere surplus drift, and much more than our Highland counties can legitimately afford. Taking the county of Inverness, the largest in Scotland, we find that the census return for 1911 gives the population at eighty-seven thousand two hundred and seventy-three, or two thousand eight hundred and thirty-two less than in 1901, and the lowest return for the county since 1811 -that is, one hundred years ago.

The beginning of the trend of emigration from the Scottish Highlands goes back to the period when, after the 1745 rebellion, owing to the failure of the Jacobite rising, the feudal system under which the Highlanders held their lands from the chief in return for their support of his standard in time of war came to an end. strong form of civil government took the place of the old heritable jurisdiction of the chiefs, who found that their claims and rights could

No. 159.—Vol. IV.

arms in the hands of a powerful retinue of

Following on the break-up of the feudal system came more settled conditions of social life, with improved means of communication and encouragement and development of agriculture; and it was soon found that the outruns for black cattle and the miserable patches of undrained and unmanured land hitherto worked by the clansmen could be put to much better use from the financial standpoint if utilised for the grazing of sheep. It is on record that a large tract of hill-ground in Glengarry let to the men of Kintail for the summer grazing of their black cattle for fifteen pounds a year was inspected by a sagacious sheepfarmer from the Lowlands, who offered three hundred and fifty pounds a year for it. This golden opportunity was not thrown away by the chiefs, and they accordingly took into their own hands the various tracts of their property which hitherto had been held by the 'tacksmen,' or These 'tacksmen,' who sublet the large tenants. lands they held to the clansmen, were often kinsmen of the chief, and owed allegiance to him as members of his clan. Accordingly they resented the action of their superior in taking the lands under his own management, and, smarting under a sense of injustice, they emigrated, with their families and their followers, to America; and so we find that from 1772 to 1792 sixteen vessels with emigrants left the western shores of Inverness and Ross-shire, with some six thousand four hundred persons, taking with them about thirtyeight thousand four hundred pounds sterling.

The emigration thus begun continued for many years, and, being fostered and encouraged by agencies and shipping speculators, attained such proportions that during the American War of Independence there was enrolled in Carolina the Royal Highland Emigrant Regiment, recruited largely from natives of Skye and Mull who had emigrated there. Even as emigrants, their native loyal instincts asserted themselves, and, as Chatham said, 'they served with fidelity and fought with valour' in the interests of the British monarchy.

The extent of the emigration at the time we no longer be successfully asserted by force of | speak of eventually reached such proportions that [All Rights Reserved.] **DECEMBER 13, 1913.**

the estate-owners became alarmed, and by common consent a meeting was convened in Edinburgh in 1784, which resulted in the institution of a Highland Society. The Duke of Argyll was the first president, and under seal of His Majesty George the Third the Highland Society at Edinburgh was granted a royal warrant for a charter Under this warrant the on 17th May 1787. society was empowered to purchase lands, tenements, &c., not exceeding five hundred pounds sterling of yearly rent, and to receive legacies, donations, &c., which sums, along with three thousand pounds granted by Government, and the annual subscription of four hundred and ninety-six members, were to be lent and employed for the furtherance of the objects of the society. Prizes were also offered for essays on agricultural and industrial subjects.

The laudable ambitions of the society did not, however, materialise, except that some impetus was given to the fishing industry. Had trades and manufactures been introduced into the north at that time before the southern districts of Scotland occupied the field, a general and permanent amelioration of the condition of the people of the

Highlands might have been effected.

About the end of the eighteenth century we find a complete reversal of the foregoing policy in operation. The epidemic of emigration had spent itself, and the people, although gradually becoming congested in the crofting townships, seemed disinclined to emigrate, notwithstanding that the continued development of the sheepfarming business, requiring little labour, had made it the less necessary for them to remain. To make room for the sheep they had been encouraged, sometimes forced, to take up crofting lands on the seaboard, and it was hoped that while cultivating the land they would also engage in the fishing industry; but so long as they were able to eke out a miserably bare living from potato-growing on the crofts and the herringfishing on the sea-lochs, they seemed to have settled down to a lethargic, hopeless existence, with the consequence that the population rapidly increased, the crofter allowing the cottar or squatter to settle on his land, and congestion to become general.

This condition of things eventually reached a crisis, and emigration as an amelioration of their miserable existence was again forced upon the people, so that in 1802 about three thousand persons left the Highlands, and in 1803 it was estimated that some nine thousand persons were about to leave. The Government now stepped in; and, realising the necessity for maintaining a population in the Highlands, if for no other reason than that the requirements of military and naval efficiency demanded it, they sent the famous engineer Telford to the north to report, among other things, on the causes of emigration and on a means of preventing it, on the feasibility of constructing a sea-to-sea canal along the line

of the Caledonian Valley, on methods of improving the means of communication by the making of roads, and on the improvement of fisheries, all of which it was hoped would provide employ-

ment for the people.

Telford advocated the adoption of this policy, and two sets of commissioners were appointed, one to supervise the construction of the Caledonian Canal, and another to deal with the improvement of Highland roads, bridges, and the fisheries. The Caledonian Canal was begun in 1803, but dragged through a weary period of construction and improvement until 1822, when it was finally finished at a cost to the Government of one million three hundred thousand pounds. The sum of two hundred and fifty-two thousand pounds was spent by the commissioners on Highland roads and bridges, a like sum being contributed by the proprietors whose estates had benefited by the new works. As a means of alleviating distress these works did a certain amount of good, but not to the extent that had been anticipated, for it was found that the Highlanders had an objection to a form of employment which entailed their leaving their homes for long periods; and emigration was only partially arrested.

We now arrive at the period about the middle of last century when even the Scottish Highlands came under that spell of industrial development to which the whole nation had awakened. invention of the steam-engine had supplied the necessary stimulus to this awakening, railways were being built all over the country, and ready employment was found for our surplus Highland population. For the past sixty years we find, therefore, that the Scottish Highlands have been a great nursery for the supply of human raw material required for the demands of industrial life in the south and for the requirements of our military and naval forces, and for either of these purposes the fine physique and sturdy independence of the mountain-bred Highlander stamps

him out as in the front rank.

Having now reviewed the economic position in the Highlands for the past one hundred and fifty years, let us look at the outstanding features of it to-day. Industrialism has developed to such an extent that it has become the sheet-anchor of the nation, and threatens to strangle agriculture, not-withstanding that the latter is still our premier industry. The land, except in so far as it can be burrowed into in search of mineral wealth or utilised for industrial expansion, is in danger of becoming of second-rate importance; and with regard to its capacity to feed the people of the nation, it is not being cultivated to anything like the extent that it might be.

How has all this economic change affected the Scottish Highlands? Briefly, it amounts to this, that owing to the manner in which industry has centralised itself into great and squalid hives in the south, the conditions of employment and of

social life open to the Highlander there have no attraction for him. He prefers the more precarious and restricted opportunity of employment in his own district, where his wife and family are; or, better still, the offer of a free and independent life in our colonies presents to him an attractive prospect, and so he ultimately forms another unit in the emigrant band.

As a rule, a development of industry in any nation tends to diminish emigration, although at the same time it encourages immigration. The peculiar feature of our industrial development, however, has been the manner in which our industries have been located at certain favoured centres. This is a feature in the development of all nations; but in respect that Great Britain has been the pioneer in industrial development, this characteristic is more marked in our country. At the present day the pressure and expansion of industry demands more room. The conditions under which the foundation of our industrial life was established, and under which it was fostered and developed, now no longer exist. A state of congestion has arisen by a slow process of natural growth in our large centres of industry, and at the present day its evil effects are so acute as to be a very severe restraint upon, if not a menace to, all future development. These effects are manifest in the scarcity of workers, and in the revolt of industrial life against the conditions under which it exists and toils; and, in spite of legislation and governmental control and supervision, an existence satisfactory to the workers in these great centres does not seem to be any nearer of attainment.

From the employers' standpoint the outlook is equally depressing. The expense and scarcity of suitable factory and workshop sites, a rapidly increasing taxation, a rising wage-bill, the restraint of the afore-mentioned Government supervision, and the distractions due to combinations of labour are all adversely affecting the profits to be made in industry of every character, and are a very serious tax on production.

It lies in the Wherein lies the remedy? creation of an environment suitable and advantageous to employer and employed alike, and such an environment is possible only in certain rural districts. Just as it was the invention of the steam-engine that gave the initial stimulus to our industrial life, so it was the presence of coal (which meant steam for the engine) which in certain favoured localities was the means of our infant industries taking root there. Such localities as combined the advantages of a coal-supply with facilities for shipping scored over others less fortunate. Originally coal was very cheap; now it is very dear, and likely to become dearer; and in a much higher ratio the cost of factory sites and rents and taxation in the neighbourhood of the coal areas have also increased.

Cheap power is a necessity to the manufacturer to-day more than it ever was, and science and

invention have made most strenuous exertions in the direction of attaining higher boiler and engine efficiency, with a view to the reduction of power costs. Electricity as a motive-power has, moreover, come into the field, and electricity generated from water-power offers under ordinary circumstances power to industrial life at probably one-half the cost of power raised from coal. It is here that the Scottish Highlands have something to offer. Nowhere else in Great Britain are possibilities of electric energy from waterpower capable of attainment to the same extent as in the Highlands, where one million horsepower awaits development. Even if the power available be put at five hundred thousand horsepower, it represents, on a comparison of the cost of an equal amount of power from coal at ten shillings per ton, an annual value of one million seven hundred and fifty thousand pounds.

The case of Italy is analogous to that of the Highlands. Italy is a country destitute of coal, with about one-tenth of her area barren rock and one-third mountains, and yet she is rapidly coming to the front industrially, and may soon rival Belgium. It is by harnessing up her small streams and her rivers that she is counterbalancing her barrenness in coal. Germany—notably Bavaria—although rich in coal, is doing the same, a 'State office for the development of water-power and supply of electricity' being one of the youngest and sturdiest Government departments there. It is the same in Switzerland, in Canada, and in the States; indeed, wherever water-power is available it is being rapidly utilised. It is only the characteristic, stubborn conservatism of the British capitalist—who, because he began with coal, refuses to try anything else-that accounts for the fact that hitherto so little has been made of the hydro-electric possibilities of our country.

The example of our Continental and oversea competitors, coupled with the difficulties and expense which are already beginning to throttle our industries in the congested centres where they now exist, is, however, serving as nothing else can to direct attention to our hitherto despised water-power possibilities. It is in the high mountain-ranges of the Highlands, where the maximum rainfall in Scotland is recorded, and where there are at high elevations innumerable great lochs to act as ready-made storage reservoirs, as well as many steep and rapid rivers, that the greatest hydro-electric possibilities of this country are to be found.

Then there is the land in the Highlands. The land problem in the Highlands presents certain unique characteristics. Except in the rich agricultural districts, such as Easter Ross, much of the land in the Highlands is poor. A great deal of what at one time supported a simple and contented peasantry is hilly and lies at a considerable elevation, where, owing to climatic conditions, the ingathering of the crops in good condition is rarely assured.

These drawbacks to agricultural occupation of the Highlands are, of course, not of yesterday, and it was under the conditions enumerated that generations of Highlanders lived out a hardy and contented existence. To-day economic developments and the march of progress, coupled with improved education and more particularly with better facilities for travel, have entirely altered the situation. The whole question has been under the consideration of the Government for many years. We got the Crofters Act in 1886, assuring fixity of tenure and compensation for improvements; and the Crofters Commission, which dealt with the question of fair rents, has just been wound up after completing a term of twenty-five years' service, and has been superseded by the Land Court. What is the net result of these efforts to improve the situation? In their twenty-five years of service the Crofters Commissioners dealt with over twenty-two thousand applications for the fixing of fair rents. They inspected about two million acres of land, of which two hundred and thirteen thousand acres were They reduced the rents by twenty-two thousand pounds annually, which on the total acreage inspected represents a reduction of twopence halfpenny per acre, and on the arable land two shillings per acre. Does it follow that these petty reductions to a crofter occupying perhaps ten acres of arable land and a share of hill represent the difference between misery and comfort to him? Remember that the rents fixed by the commissioners were the 'fair and reasonable' rents which in their view the crofters were bound to pay to the proprietor for the land they held. As a comment on their final report, we find the commissioners confessing that while they doubtless established the relationship between landlord and tenant on an equitable basis, they regret that any measure of improvement in the lot of the crofters has been brought about as much by assistance received from sons and daughters who had prospered in the cities in the south or who had emigrated as by the result of the commissioners' labours. Then we have the Congested Districts Board, who by the purchase of suitable land and letting it out to crofting applicants have superseded the private landowner. The experience of this board is a most unfortunate one, for we find that they have been unable on one of their properties to collect more than a very trifling proportion of the rents due to them; and indeed the difficulty of rent collection is one of the most embarrassing problems they have to deal with.

Enough has been said to show that agriculturally land in the Highlands will never again do what it formerly did in supplying the simple requirements of an equally simple and contented peasantry; but associated with an industrial development from the utilisation of its water-power the land could not fail to be extremely valuable. The geographical location

of the North of Scotland and the natural advantages of the country render such a development highly attractive. The fine, indented seaboard, the fact that no part of the country is more than twenty miles from the sea and the line of the Caledonian Canal, the existence of an efficient railway system, and the communication afforded by good roads, all serve to meet the requirements of modern industry.

If the Government is to do anything to retain a population in the Highlands, it must associate a policy of industrial development with its land policy. A Royal Commission ought to be appointed to investigate and report on the water possibilities, just as is being done in other countries. Thereafter Government funds should be available for the development of several of the areas most favourably reported on; or, if preferred, Government grants free of interest for, say, twenty years should be available for the encouragement of development in the hands of private enter-The power would be transmitted to the seaboard or to the neighbourhood of the railways, The financial assistance and distributed there. suggested would serve to tide over the lean period necessary for the power demand to grow until the scheme itself paid interest on its capital cost. The land required for the factory and workshop sites could be acquired under the powers already possessed by the Board of Agriculture or by the Development Commissioners; or if these powers are insufficient, they can be amplified.

The whole policy is as feasible as that which provides funds for the construction of light railways; and if industrial development grew to an extent which justified railways, these would soon be built without Government assistance. Distance has now been annihilated, and our Scottish Highlands are as accessible for the import and export of raw and finished materials as any other part of our country. It surely has an advantage over the inland centres of industry in the Midlands of England; and if the Government were to inaugurate an industrial-cum-land policy on the line sketched out, our industrial interests would welcome it. The decentralisation of industry is imperative—indeed it has already begun; and for the reasons given the Highlands have possibilities such as no other part of the country can put forward. A home-life re-established in a fine, healthy Highland environment, with employment readily available and supplementing the living on the croft, and with the opportunity for cottage industries, as in Switzerland, as well as the profit and recreation possible owing to the possession of land, would commend itself to employer and employed alike; and in addition to improving the physique of the race, it would go a long way to check emigration and re-establish the old Highland home, and to abolish what is nowadays a festering sore in our economic life—namely, 'industrial unrest.'

A KNIGHT ON WHEELS.

CHAPTER II .- LE PREMIER PAS.

HAVING disposed of the Reverend Aubrey Buck's correspondence—it was not so bulky as on previous occasions, for evidently the paragraph in the Searchlight had dealt its originator a mortal blow—uncle and nephew sat down to an excellent luncheon, cooked and served by James Nimmo. No woman ever crossed the threshold of the house in Hampstead.

James Nimmo had originally been a ship's steward, and his conversion to misogynistic principles had been effected comparatively late in life. Always a man of thrifty disposition, he had shirked the responsibility and expense of matrimony until he had attained the ripe age of forty. Then he fell a sudden and abject captive to the charms of a damsel of Carnoustie, half his age. The match was struck, but it was stipulated by the girl's parents that the wedding should not take place until after James Nimmo's next voyage.

Before sailing the prospective bridegroom handed over to his beloved the greater part of his savings, to be expended in the purchase and outfitting of a suitable establishment—to wit, a bijou villa in Broughty Ferry—in order that the honeymoon might commence without unavoidable

delay upon his return.

Eight weeks later James Nimmo sailed into the Tay, to find his turtle-dove flown. Alarmed possibly by the unrest produced in the real property market by recent legislation, the lady had forborne to purchase the bijou villa. Having no house, to spend money upon furniture was obviously a work of supererogation. Lastly, inspired perhaps by a yearning for a wider field in which to exercise her undoubted talents, the affianced of James Nimmo had decided to emigrate to Canada. This decision she promptly put into execution, departing without undue ostentation in the steerage of an Allan liner, and taking with her her parents, James Nimmo's savings, and a young carpenter of steady habits and good wage-earning capacity whom she had married three days previously.

Six months later James Nimmo made the acquaintance of Uncle Joseph on board a P. & O. liner, homeward bound from Bombay. James was deck-steward on that voyage, and Uncle Joseph's attention was first attracted to him by the extreme coldness, not to say hauteur, with which he attended to the wants of seasick lady passengers. James Nimmo, on his part, noted with grim approval the whole-hearted fashion in which Uncle Joseph, who was a presentable bachelor of thirty-six in those days, boycotted the long row of chairs in the lee of the deckhouses, and confined himself to the smoking-room

or the windward side of the ship.

One hot night in the Red Sea a chance remark

of Uncle Joseph's unlocked the heart and loosed the tongue of James Nimmo, and before dawn the whole of the tale of the fickle beauty of Carnoustie had been told, for the first and last time, to mortal man.

At Tilbury James Nimmo resigned his post and abandoned the service of the sea in order to follow Uncle Joseph. Since that day they had never been parted. All this had happened more

than ten years ago.

Philip had been added to the household at Hampstead a few days after Uncle Joseph had landed at Tilbury—in fact, it was on Philip's account that Uncle Joseph had come home—and from that moment he had lived and breathed in a society exclusively masculine. He still retained recollections of the period when petticoats ruled him, but they were very faint, for his nursery days had ended abruptly at the tender age of four.

Sometimes, though, he had visions. He saw dimly a stout, autocratic, but on the whole goodtempered being whom he called Nanny. He saw more dimly a big, silent man, who occasionally took him on his knee and fed him furtively with the tops of eggs, and made laborious conversation. And most dimly of all he saw a lady, very dainty and sweet-smelling, who always appeared to be talking. When she talked to a group of other ladies and gentlemen she seemed to smile and sparkle like some pretty jewel. But when she was alone with the big, silent man she neither smiled nor sparkled, and her voice sounded shrill and hard. Philip had a vague recollection that on these occasions the room always seemed to grow darker.

The pretty lady took little notice of Philip, but Philip took sufficient notice of her to be able to realise one day that she was gone. Nothing else about the house seemed changed except that. Philip still played in the nursery, and went out walking with his Nanny; he even received the tops of eggs from the big, silent man, who seemed to grow more silent and less big as the days went by. But the pretty lady never came back. Once Philip ventured to inquire of the man what had become of her, but the question was not answered, and the man seemed to grow even smaller than before; so Philip, fearing lest he should fade away altogether, refrained from further investigations.

Not long after this Philip was taken to see the man in bed, and he noted with concern that the man had shrunk away almost to nothing. Philip was lifted up, and the man kissed him, which he had never done before, and said something which Philip did not understand, but which made Nanny cry. Philip cried too when he was taken back to the nursery, and Nanny endeavoured to comfort him by giving him an egg with his tea. But Philip would only eat the top. The man would have been pleased if he had known this; and perhaps he did, for during the hour of Philip's tea-time he passed on to a place where people know everything, and—which is far better—the reason of everything.

After that came a period when the windows were darkened and people came and went in great numbers throughout the house. Philip had a new black velvet suit, and rather enjoyed the stir and bustle. But when this émeute was over the days grew very dull, for Nanny and Philip and one or two maids seemed to have the house to themselves. Everybody appeared to be waiting for something. Even the glories of the black velvet suit began to pall, and Philip was genuinely relieved when one day a carriage drove up to the door and a gentleman stepped out and rang the bell with an authoritative peal. Most gratifying of all, the gentleman was shown straight up to the nursery, where he shook hands with Philip and directed the boy to address him as Uncle Joseph. The gentleman strongly resembled the Man, except that his back was stiffer, and he held his head more proudly, and spoke in a staccato and commanding voice.

It was Philip's last day in the nursery, for Uncle Joseph took him away that very afternoon. Non sine pulvere, however. For a most unexpected and memorable conflict arose between Uncle Joseph and Nanny. Philip, who sat on the window-seat an interested witness, never forgot that spectacle. He had seen Nanny cross, and he had seen Nanny cry; but he had never before seen Nanny cross and crying at the same time. Her voice rose higher and higher, and then broke. Philip heard her say, 'That lamb!' several times; and Uncle Joseph replied, in a very steady, resolute voice, 'Never again! Never again to one of your sex!'

After that events moved rapidly, and Philip remembered little more than a hurricane of tearful farewells from Nanny and the maids, and a long journey in the carriage to the house in Hampstead. Here he was introduced to James Nimmo, who provided him with an excellent tea, and then washed him (with surprising skill) and put him to bed. After a few days Philip, with the happy adaptability of extreme youth, grew so accustomed to his new surroundings that it would have embarrassed him extremely to have his face washed by a lady.

Now, after ten years, the visions of his nursery days came but rarely. The pretty lady he had almost forgotten. Once a whiff of scent, emanating from a houri who passed him in the Finchley Road, brought her memory back to him, but only for a moment. Poor, cross, faithful Nanny was a mere shadow. The Man dwelt most strongly in his recollection, but he

was becoming inextricably merged with Uncle Joseph.

James Nimmo and Uncle Joseph divided Philip's upbringing between them. Uncle Joseph taught him to read and write, while James Nimmo instructed him in the arts of cookery and needlework. By the time he was ten Philip could make an omelette, repair a rent in his own garments, or 'sort'—to use James Nimmo's expression—a faulty electric bell.

Uncle Joseph broke to him the news that the world was round, and initiated him into the mysteries of latitude and longitude and the geography of continents and oceans. James Nimmo's discourses had a more human and personal touch. He spoke of far-reaching steamer-tracks as if they had been London thoroughfares, alluding to mighty liners with no more emphasis than if they had been so many motor-omnibuses—as indeed they are. He criticised New York, Colombo, or Melbourne in no mere scientific spirit, but from the point of view of a thrifty Scot ashore for a few hours' pleasure.

Neither was Philip's literary education neglected. Uncle Joseph cultivated his intellect, while James Nimmo enriched his vocabulary. From Uncle Joseph he learned to enjoy the masterpieces of his native tongue, and to express himself in direct and cogent English; but it was from James Nimmo that he picked up such colloquial patois as 'ashet' and 'gigot' and 'besom.' He also referred at times to 'the morn's morn,' and was accustomed to inquire of his uncle, 'Are you not for another cup of tea?' or 'Will I open the window?'

It was to James Nimmo, too, that Philip owed his first introduction to poetry. James was in the habit of referring constantly to a friend of his, apparently deceased, whose full name Philip never rightly ascertained, but whose invariable appellation was 'Rabbie.' Rabbie, it appeared, was the only real poet who had ever existed. His soul was the soul of Scotland. Rabbie had never penned a line which did not get home to his countrymen; conversely, no Scot could ever be overtaken by a great thought or conceive a moving sentiment without finding that thought or sentiment already expressed in perfection in some work of Rabbie's.

James Nimmo could quote whole stanzas of him, and kept a store of apposite tags and passages from his works upon the tip of his tongue. He was addicted to the recital of lengthy selections from an intensely respectable poem entitled 'The Cottar's Saturday Night,' and would throw off shorter masterpieces—'The Twa Dogs,' 'Scots Wha Ha'e,' and 'Auld Lang Syne'—in their entirety. Most of these performances Philip secretly considered rather dull, but he made an exception in favour of a curious little poem about a mouse, which James Nimmo used to recite with great tenderness and a certain

pathetic effect. Our affections must have an outlet somewhere. Old maids cherish pug-dogs; perhaps it was the same instinct which softened the sere and yellow heart of James Nimmo towards the 'wee, sleekit, cowrin, tim'rous beastie,' whose schemes had gone agley too, and whose efforts to found a home for itself had met with no better success than his own.

The fact that Rabbie was subject to human weaknesses of any description, or had ever experienced any passions other than those arising from patriotic fervour or political animus, was concealed from Philip for many a year. Once only did James Nimmo lift a corner of the curtain.

'He went tae his grave at seven-and-thirty,'

he mentioned one day.

'Why?' inquired the ingenuous Philip.

'Because they had drained the life oot o'him,' replied James Nimmo, his face hardening. 'I mind a vairse he yince wrote. It micht ha' been his ain epitaph:

As father Adam firrst was fooled—
A case that's still too common—
Here lies a man that wumman ruled,
The deevil ruled the wumman!'—

a summary of the life and character of Scotland's national bard which his most ardent admirer will admit errs a little on the side of leniency toward Rabbie, and ingratitude toward a sex which, all things considered, had no special cause to bless him.

After luncheon Uncle Joseph disposed himself to slumber for half-an-hour, while Philip, who, in common with his kind, always felt particularly energetic when distended with food, practised

high-jumping in the garden.

At two the pair went out for a walk. If it happened to be a Thursday—as it was to-day they repaired to a large bank in Finchley Road, where the notes and gold which had come out of the morning's envelopes were handed over to a polite cashier. Uncle Joseph was a well-known When he strode in on Thursday figure here. afternoons the cashier always sent in a hurried message to the manager; and that financial Janus would emerge, smiling, from his temple behind the glass screens and come round to the front of the counter and shake hands with Uncle Joseph, and engage him in agreeable conversation, while Philip watched the cashier licking his thumb and counting bank-notes with incredible rapidity. After entering the numbers of the notes in a big book, the cashier would seize the bag containing the gold and silverquite a number of Uncle Joseph's subscribers used to send actual coin in registered envelopes; they were of the type which does not understand postal-orders and mistrusts cheques-and pour it in a jingling cascade upon the counter. having counted it by playing lightning arpeggios upon it with his fingers, he would sweep it up in a brass coal-shovel and fling it contemptuously into a drawer already half-full, hopelessly mixing it with other people's money from the start. To Philip, like most of us, banking was a mystery.

The manager and Uncle Joseph then shook hands, and the proceedings terminated with a vote of want of confidence in the weather. After that Uncle Joseph and Philip walked to Swiss Cottage Station, where Uncle Joseph departed alone by the underground to another bank, in the Edgware Road this time. Here he deposited a bundle of cheques and crossed postal-orders. The majority of these were drawn to the order of the Treasurer of the International Brotherhood of Kind Young Hearts, though a fair proportion bore the names of Master T. Smith and the Rev. Aubrey Buck.

Out of consideration for the manager of the bank at Hampstead, who, had he been asked to place sums of money intended for such a diversity of people to the credit of a single individual, would undoubtedly have become greatly confused -and deeply interested—Uncle Joseph kept a separate account at the Edgware Road bank for all contributions to his benefactions which did not arrive in the form of notes or cash. These he invariably endorsed, 'Everard James, Secretary.' The same name was inscribed upon his pass-book. It was understood in the Edgware Road bank that Mr James was general director of a large philanthropic institution, and the fact that he paid in so many cheques endorsed by other people was doubtless due to the circumstance that these were minor officials of the same organisation—as indeed they were.

Philip usually devoted his solitary walk home from Swiss Cottage Station to a minute inspection of the shop windows in Finchley Road. On this particular Thursday afternoon, though, he began to run. The soundness of his physical condition may be gauged from the fact that he ran up Netherhall Gardens, a declivity much in favour with prospective purchasers of motor-cars out on trial-trips, and in corresponding disfavour with would-be vendors of the same. He ran on past the newly built Tube Station, up Frognal, and presently reached the outskirts of Hampstead Heath. It was half-past three, and the

red wintry sun was sinking low.

Suddenly he paused, and then stopped dead. He was conscious, deep down within him, of a recurrence of the sensation which had stirred him on the previous Sunday as he walked over this part of the Heath with Uncle Joseph. On that occasion he had noticed a little girl sitting on a gate. She had smiled at Philip as he passed, a wide and friendly smile. Philip had not returned it, for Uncle Joseph had noted the smile and improved the occasion at once.

'You see, Philip!' he said. 'The hunting instinct already! That child has never seen you before; she will never see you again; she would not care if you went to perdition to-morrow, though she would feel intensely gratified if she could be certain that you had gone there on her

account. She is nothing to you, or you to her. But you are a man and she is a woman. So she smiles at you. It is the first and most primitive of the arts of attraction. There is nothing behind the smile, nothing but an undeveloped predatory instinct. And that is what Man has to struggle against all the days of his life, to the detriment of his own and the world's progress.'

Long before Uncle Joseph had concluded these timely observations the little girl was out of sight. 'Predatory' was a new word to Philip.

He made a mental note of it, and resolved to question Uncle Joseph as to its meaning on a more suitable occasion. Meanwhile he felt that he had had an escape—an escape and a warning.

Still, here he was, four days later, back in the same danger-zone. And there, sitting on the same gate, with the setting sun glinting on two long, honey-coloured pigtails, sat the little girl.

'Hallo, Boy!' she said, and smiled again.

Philip gave her a severe look.

(Continued on page 35.)

PEARLING IN AUSTRALIAN WATERS.

By J. O. BYRNE.

THE finding of even a moderately valuable pearl in Australian waters starts a fever of excitement among the northern coast fishers. A late find in Torres Strait, made by a native diver, sold for three hundred pounds. The native was thrifty and religious, and he expended the money in buying the boat he had previously hired, and paying off the balance of debt owing on his village church.

The lucky diver is not always fortunate in the price he gets or in the use to which he devotes the proceeds. A West Australian pearl marketed for ten thousand pounds brought the fisherman only ten pounds; another, about the size of a pigeon's egg, and on first examination reported to be a wonder of the pearl world, was lost, and the fisher and his friends are unable to say what has become of it. Many Australian pearls have been sold for from seven hundred to one thousand pounds each; but the find serves as a fresh stimulus to diving activity whether the finder receives little or much.

The most important pearl-fisheries are on the north-west and north-east of the continent, and the rise and fall of workings would, if recorded, resemble a weather-chart of a variable season. On the north-west side the business is principally in the hands of white men; on the north-east it is nominally carried on by whites, but in reality by coloured labour. Broome, the centre of the north-western industry, is now thriving rapidly; but Thursday Island, the centre of the north-eastern trade, is tending toward Oriental contentment with small profits. At Port Darwin, the most northern point, the work is almost wholly in the hands of Asiatics.

The business was originated by white men, and pearling in Australian waters is not yet fifty years old. A little over forty years ago a few intrepid adventurers, finding themselves in Torres Strait, examined their new surroundings, and decided to give pearling a trial, as some of them were expert divers. When they had carried this on for a time they bethought themselves of turning over the diving branch of the work to the coloured people who hung about. There were

aboriginal Australians, Malays, Rotumah men, Loyalty Islanders, and Japanese at hand, and the white divers proceeded to instruct them in the art. In a few years there was no demand for white divers, and the coloured man had a monopoly of the work. Legislation in the interest of white divers has been passed, but the results are still uncertain.

Australian pearls are of many shapes and colours, and in the trade have names to distinguish them. Pearls under ten grains are sold by the ounce, above that by the grain. Colour has a deal to do with the value. The white pearls go mostly to Europe, and the yellow ones to India. In Australia an ounce of good white pearls will fetch up to one hundred pounds, but sometimes realise only a fifth of that amount. The yellow pearls may be rated on an average at about half the value of the white ones. The seedpearls used for cheap jewellery can be had for one pound per ounce, and discoloured pearls for seven shillings and sixpence; but if the discoloration is peculiar the value is sometimes enhanced. the discoloration consists of a bar or a tip the price may run very high. For the lowest class of seed-pearls there is a constant demand among Oriental physicians and apothecaries, who grind them into a powder and administer it to patients as curative of many ills.

At one time-before the diving-dress became general and supervision the thorough business it is now-divers were suspected of much ingenious dishonesty, and the suspicion was often well founded, as they sometimes secreted a pearl when opening the shells; but supervision has practically put an end to that. Some boat-owners keep the shells in water, take them ashore, and open them at leisure with their own hands; others stand over a couple of Kanakas who do the work on board. The idea that the Rotumah 'boys' and Japanese—both among the best divers—can tell a pearl-bearing oyster by touching the shell is still widely prevalent; and it is alleged that when the touch so advises, the diver thrusts the oyster into the crevice of some rock, from which it is afterwards taken out and appropriated as his own

property; but as a rule the suspicion is groundless. Divers who are on bad terms with their employers or are about to hire a boat of their own may come upon a nest of oysters, and on returning to the boat declare that there is nothing below; but even that trick is becoming less effective day by day. The glass-bottomed boat is coming into use in pearling waters, and the master of such a boat is able, if the water be fairly clear, to inspect the sea-bottom while the diver is at work.

Diving makes peculiar demands on the mental and physical systems of the men engaged. Some declare that during a part of his time below the diver's mental condition borders on insanity. grudge against, or a suspicion of, those above becomes suddenly magnified in the diver's imagination, and he signals to be pulled up, resolved to have revenge there and then. However, when he reaches the deck the imaginary wrongs vanish or shrink into common, everyday disagreements. On the other hand, men prone to violence have become peace-loving and docile by a course of diving.

At a depth of eighty feet a diver cannot see very well, his movements are slow, and breathing begins to trouble him. At every foot deeper he thinks how slight a mishap may foul the life-line, and all his thoughts tend to centre on himself and his hazards. At such times the inadequacy of his pay appears to him as a huge grievance—he gets six to twelve pounds a month, which seems an insignificant reward; but when he comes to the surface and rests a few minutes all is again

Sharks, which are supposed to be a great terror, give the average diver little concern; he is more afraid of the sea-eel of north Queensland. diver is perfectly safe on the sea-bottom, because man-eating sharks are not ground-feeders; if they see him they wait till he rises for a breath of air, and then they try to intercept him, but the diver and his long knife nearly always win. The diver's worst enemy in the deep is the giant | fascination.

This large creature, from five to seven mollusc. feet across the shell, lies with extended jaws waiting for prey. The diver drops out of his boat with a heavy stone attached to his feet, and if a leg touches the bivalve its jaws close on it with a snap, and the man must amputate the limb or perish, as he is held with a tenacity that it would take several horse-power to loosen, and the mollusc is anchored to the bottom with a cable of its own stronger than a three-inch rope.

The Australian pearl coast is creviced with gullies and ravines, deepening in the holes to eighty fathoms. Worse than sharks or the giant bivalves, from a physical point of view, is the water pressure at more than twenty fathoms. The diver who goes deeper is in peril. Even at a less depth he is in imminent danger of contracting what he calls 'rheumatics,' but is in reality incipient locomotor ataxy. When a diver comes up after even a twelve fathoms immersion every crease of his under-garments is found to be reproduced on his skin, owing to the pressure of the water. While below, the body is reduced in bulk by the weight of the water; but as the lungs and heart are not so well protected as the brain and spinal cord, the result is undue expansion of their capillary vessels.

Over two thousand miles of the Australian coast skirts pearling waters. Right round from Cape York to Shark's Bay divers snatch finds of value from time to time in waters ranging from four fathoms to twenty fathoms. Under the Commonwealth 'White Australia' law, the indenturing of Asiatics for diving purposes ceases on 31st December 1913. Under the new regulations the Government will supervise the divers' hours of work, their food, their sleeping accommodation, their wages, and their state of health. Old hands think that rigid rules applied to such

an adventurous pursuit will not work.

There are of course other industries allied to the search for pearls, but the pearls are the great

ROSEMARY COURT.

CHAPTER III.

MONSIEUR PAUL CARTIER, the curé of Amyans, was happy for the moment amongst his beloved roses. He was bending over a plant with the loving care of a mother who has discovered some hidden charm in a favourite child. His long, slim fingers caressed a golden bloom here and there; he frowned as he removed a speck or two of green fly with a camel's-hair brush. No astringent soap and water ever defiled the glossy foliage of the curé's roses; these barbaric methods were not for an artist such as he.

There were hundreds of roses in the straggling garden, with grassy paths here and there; the soft air was heavy with the fragrance of them. From bush to bush Paul Cartier moved deliberately, much as a schoolmaster might have done amongst his pupils. His fine face, lined in thought with the passing of the years, was lighted up by a pair of gray eyes introspective and benign, as befits a scholar and recluse who lives only for his books and his flowers. His long gray hair was partially covered by a velvet cap, all in odd contrast to the linen wrap he was wearing. From the small cottage in the background there came the drowsy hum of the handloom, for Jeanne, the cure's housekeeper, was weaving cloth wherewith to make her master a

new Sunday coat, which in her opinion he sadly needed. But there, what else could you expect from an improvident old man who spends all his stipend upon roses and listening to stories of distress from the most improvident? Thus Jeanne spoke of her master, and frequently to his face. Not that any one else would have been permitted such a liberty, for in her secret heart she had the greatest admiration for him, and nobody was better served.

In spite of the golden glory of the afternoon, in spite of the fact that the new China roses were doing exceptionally well, there was a suggestion of a cloud on the cure's brow, and ever and anon a little sigh escaped him. He seemed to be listening for something. Presently it came in the shape of a very gallant young gentleman of whom the curé approved at the very first glance. Because, you see, though Paul Cartier lived in a cottage and grew roses, there had been a time when the Church had marked him out for preferment, and courtiers and politicians had prophesied that Cartier would go far. Ah, well, that had been long ago, and long since forgotten; but Cartier knew a gentleman when he saw him, and when his eyes met those of Rupert St Bruyere he smiled.

'I think you will do, my young friend,' he said sotto voce. 'Nothing of the petit maître about you.' Then he went on aloud, 'I am pleased to see you. Mr St Bruyere, is it not?'

'I came in response to your letter,' Rupert said. 'Also I sent you a telegram this morning. It is exceedingly good of you to take all this trouble, sir.'

The curé bowed courteously. Decidedly this young man would do. His French, too, was excellent. There was nothing the matter with the curé's English, so far as that went. They conversed in the two languages indifferently, which was not without its charm.

'Will you honour me by coming into my cottage?' Cartier asked. 'I shall be pleased if you will lunch with me. I see from the signs made by my excellent housekeeper that the meal is ready. Just a poulet and salad, with a compote of my own fruit to follow. And a glass of sauterne—yes, the last but one of three bottles which I reserve for great occasions. A present to me, sir, from a cardinal archbishop, one of the princes of our Church. For, mark you, this is a special occasion.'

The cottage was on a tiny scale, but everything was scrupulously clean and neat. Cartier sat at a plain deal table doing the honours of his house with a simple dignity and charm. The cloth was coarse and evidently of home manufacture, but dazzlingly white and sweet-savoured. On it was a service of coarse blue Delft, in pleasing contrast to some quaint old silver and glass of Venetian ware which was almost priceless in its way.

Rupert St Bruyere ate with appetite which clean life and clear conscience brings; he was

perhaps not altogether conscious of the exquisite simplicity of that simple meal. He sipped the sauterne, imprisoned sunshine as it were, and listened as the curé told his story.

'It is here, my young friend,' Cartier said, 'where my apology should come in. It is but three days since I wrote to you a letter which you should have received six months ago. I made no mention of the fact in communicating with your esteemed grandparent, but it is like this. It is six months since Madame Cécile Parcourt died in the arms of my faithful Jeanne. I was present at the time, and ministered the last rites of the Church. It was my duty, seeing that I almost alone knew that unhappy lady's history, at once to write to her friends. But, you see, I did not know who these friends were. I had quite forgotten Madame Parcourt's maiden name. She had come down here for a holiday when that fatal illness seized her. I understood that all her papers and possessions were in Paris. You see, we did not know how near the end was, for that came with painful swiftness. Then there was a deal of official delay—what you call red tape—before I was allowed to see these documents. More than five months had elapsed ere I was in a position to proceed; and when the time came I began to realise what that dear child had become to me. I could not find it in my heart to part with her. I beg your pardon! Oh yes, there was a little money; indeed there is some of it left still. It was all wrong of me to hesitate, and I will ask you to forgive me. When you see Cecilia you will understand.

'She is here with you?' Rupert asked.

'Oh no, but in the village, truly. She stays with a worthy lady, the widow of an officer. You will see her presently. We have a charming old custom in this village which we call the Feast of Roses, and this is our fête-day. It is equivalent to what you call Queen of the May. And Cecilia is our Rose Queen. Ah, a charming and delightful picture! All in white, and roses in her hair, and round her throat the dazzling jewels that her mother wore when she charmed all hearts at the Comedie Française. A little theatrical if you like, for see you, monsieur, they are but stage gems; still, one makes allowance for youth, and those stones are not so bright as the eyes of the wearer. We do not take the same views quite of life here as you do in your grayer climate. You see, we know the value of colour, and how to weave it into our daily existence. Ah, but you will forget all this when you see the child. I pray you not to imagine anything theatrical or tawdry about our dear Cecilia. For she has been well brought up. She has always known that her ancestors have been of the most distinguished.'

'But I understood,' Rupert said hesitatingly, 'that she had taken up the same—er—profession'——

'It was contemplated. Cecilia has appeared in one or two minor parts. Monsieur St Bruyere, in spite of your proverb, it is possible to touch the pitch and remain undefiled. That you will see for yourself before long. In many ways Cecilia is a child yet, "standing with reluctant feet where womanhood and childhood meet." I know something of your poets, you see. They are all my friends.' He waved his long, slim hand to indicate the crowded book-shelves with which the room was lined.

A big bee droned in through the open window. From somewhere in the hazy distance there came the sound of fresh young voices raised in a sort of harmonious glee. The music came nearer and nearer; then Cartier rose and led his guest

into the garden.

Beyond the sweet-briar hedge that formed a boundary to the garden a youthful procession was passing. It was composed of girls, for the most part village maidens between the ages of eight and eighteen, all clad in white, and all decked in roses from the deepest crimson to the palest yellow. They sang light-heartedly and danced along the road; sang that same quaint, haunting melody their forebears had sung any time for the last few hundred years.

The bigger girls were grouped round one taller than themselves, who walked in the centre of them all. The mellowing sunshine of the waning afternoon fell on her fair hair, and seemed tenderly to touch the pure white beauty of her face. There was laughter on her lips—red lips parted to show the white, even teeth

within.

Outside the gate the procession paused for a moment, and the tall girl, with a wave of her hand, broke from her bodyguard and came up the flag-stones between the herbaceous borders to the spot where the men were standing. She floated along light as a thistledown adrift upon the wind. Her white diaphanous drapery barely concealed the exquisite outline of her form; the spun-gold glory of it. She was a child, and yet a woman, smiling and innocently happy, still carrying herself with a certain dignity that spoke of birth and breeding.

'Oh, my child,' the curé said softly, 'here is your cousin Rupert St Bruyere come to take you

home.

The girl's face clouded, and her eyes were full of tears.

CHAPTER IV.

MEANWHILE the smooth wheels of life seemed to be turning with the same leisured ease at Rosemary Court. So far nothing had served to disturb the high serenity of the household and its mistress, who sat in the sunshine in the rose-garden working at her lace as if the

passing days were hers, and hers alone; and yet behind that placid serenity a struggle was going on. So far the household knew nothing of the impending change; indeed, Madame St Bruyere herself had not grasped the inwardness of it yet. She had quite made up her mind to take this grandchild under her roof; she would fit some niche somewhere, and the serenity of existence at Rosemary Court would doubtless do the rest. No girl, however wayward or ill-trained, could ever resist such an atmosphere as that. The child must know she was on probation; she would have to learn the moral of the story which her mother had written across her own wayward life, and once that was committed to heart she might possibly become a St Bruyere in something more than name. Naturally, she would not expect to be welcomed with open arms; naturally, she would come with a humble and contrite heart to the sanctuary.

The contemplation of this line of policy pleased Madam, and she expanded in the contemplation of it; yet at the same time it left her vaguely uneasy and dissatisfied. It was very well to be a grande dame and chatelaine of historic family; but, then, every woman cannot claim to rule her own heart, and Madam was conscious that deep down somewhere was a longing to see this girl, a keen desire to trace in her some likeness to the

daughter whom she had lost.

Rupert had written merely a few lines to say that he had met his cousin, and was bringing her home in a day or two. He made no comment whatever; there was a certain amount of business to be done, and when that was finished he was returning home. It was just as well, he said, that everything should be cleared up, and that Cecilia should start afresh with no constant reminders of the past.

With this for the moment Madam had to be content; and yet she was feeling a long way from being satisfied. As she sat there bending over the filmy lace she looked pale and drawn; there was a haunting shadow under her eyes, and an uneasy movement at every sound as if she dreaded some unwelcome intruder. In her black silk lap lay two letters which she had torn into tiny fragments. A moment later there came a servant from the house bearing a salver on which was a visiting-card. It was an unusual hour for callers, and Madam's brows knitted slightly as she surveyed the card through her long-handled glasses.

'Tell Sir Charles I will see him here,' she said.

What could the man want? she wondered. Why had he ventured to intrude here after all these years? His very presence here was an outrage. Of course he was Sir Charles St Bruyere of Winstay Manor, and a man of unimpeachable lineage; but his claim to call himself head of the House was a gross impertinence. On Madam's part, at any rate, this claim had been the source

of a deep and lasting offence. In her eyes it had been almost a sacred matter. For twenty years now she had seen nothing of this man, and here he was calling upon her as if he had been guilty of no more than some trivial fault.

He came down the tiled path with that long, striding swagger of his which Madam remembered so well. Had he been another man she would probably have approved of him, for he, like herself, was a survival, and a type as extinct as the Camberwell Beauty is extinct among British butterflies. Not that he was a butterfly so much as a hawk. Beyond question he was a beau. He brought with him faint memories of Tom and Jerry, and the old roaring, swaggering days when the First Gentleman in Europe held riotous sway at the Brighton Pavilion, and all men of fashion strove to live up to him. But he was a fine figure of a man, this Sir Charles St Bruvere. Despite his seventy odd years, he was as upright as a dart. His hair was dyed; so were his flowing side-whiskers, and under his prominent chin his short beard was oiled and curled. He wore a long frock-coat of the sort that fitted tightly over his hips, and he still clung to the high collar and enormous stock which had been in favour in the days of his youth. His tight trousers were strapped over his boots, and the great wide-brimmed beaver hat was set jauntily on the side of his head. On the whole, he resembled an elderly, well-preserved hawk, very satisfied with life and still knowing how to appreciate it.

With a certain graceful, swaggering, easy insolence he took Madam's hand and raised it

to his lips.

'This is an unexpected honour,' she said coldly. 'And, pray, to what am I indebted for this pleasure?'

'Not a day older,' Sir Charles said as he dropped graciously into his seat. 'Gad, it's a queen you should have been, Marcia!'

Madam frowned severely. This was the only man who, for the last forty years, had dared to call her by her Christian name. 'I thank you,'

she said. 'But why are you here?'

'Egad, always direct to the point! Never forgiven me yet, I suppose? I came down here to do you a good turn. It's a sensation I haven't experienced for half-a-century. Upon my word, Marcia, there isn't much difference between us after all. We were both brought up in the same school; we have the same contempt for the middle classes. Only you prefer to shut yourself up here, and I'm in the world as much as ever. No use cutting off your nose to spite your face. When I turned my back on Newmarket and Crockford's I'd got just a thousand guineas in the world. I might have been living now in one room at Winstay, feeding myself on rabbits—a succulent food, my dear Marcia, but slightly monotonous. So I went into the City and made money, and I suppose I am worth a quarter of a million to-day, with not a soul to leave it to bar young sobersides whom you keep tied up to your apron-strings.'

'All this is very interesting,' Madam said

languidly.

'Oh, wait a bit! I was about to say there are ways of making money other than in the City. For instance, art dealing is by no means a losing game if you have a natural gift for judging pictures and furniture. I have that gift. Like you, I was born in an atmosphere of the rare and beautiful; in fact, it is second nature to me. And when those American cousins of ours came over, inviting Lazarus and Moses to rob them of their mighty dollars, I took a hand in the sport; not to rob them, of course, but to see that they had what they paid for. this end in view I took a shop in Bond Street, and placed there a man I could trust. In five years' time, under my nom de plume, I had achieved a rare reputation on two continents. And, incidentally, I had made a hatful of money. And I had learned a few family secrets too.

The bored, proud look had faded from Madam's face. The ivory pallor of her skin had given place to a dead white like the centre of a rose.

Sir Charles could see her hands trembling.

'Shall I go on, Marcia?' he asked.

'If you please,' Madam said almost timidly.

'Many thanks! Let me see; we were discussing family treasures, which mean family secrets. Now, if I remember rightly, this place was christened Rosemary Court back in the days of Sir Joshua Reynolds to celebrate the fact that old Timothy St Bruyere's two boys married the twin daughters of a swashbuckling old General who had made his money in the army in Flanders. These twin heiresses were christened respectively Rose and Mary; hence the pretty conceit of renaming this house Rosemary Court. Eventually all the money found its way into the St Bruyere coffers. And now I come to the point. Sir Joshua painted those two beauties, and it was one of his finest efforts. I am not going to ask how it was that the picture was not made an heirloom, and I am quite content to acknowledge that you, as head of the House, have a perfect right to dispose of the picture if you choose. But why, my dear Marcia, do you choose? Nobody knows your pride better than Why, you would rather cut your right hand off than sell an ancestor. In your eyes it would almost amount to murder.'

'I have yet to learn,' Madam said, 'by what right'----

'Oh, if you are going to take that tone there is no more to be said! You can admit or deny as you please that you sent the picture to Hammerstein's in Bond Street, and asked them the value of the painting with a view to a purchase. In so many words, I am Hammerstein of Bond Street. I opened the letter and dictated the reply. Hang it all, Marcia! my family pride

is not buried in the City yet. I could have bought the picture a bargain. If you want to raise money on it without sale'——

But Madam had risen to her feet. 'Come and see me again,' she whispered; 'and do

not think me inhospitable if I do not ask you'----

She turned away and walked slowly toward the house.

(Continued on page 40.)

THE SUPPRESSION OF THE SEPTGO HINGTL

PART II.

WHILST I was in consultation with the Shantung man as to the advisability of risking a run on shore to see the principal shopkeeper, who was an honest trader, and in whose house lights were still burning, my attention was drawn to flashes of phosphorescence in the calm blackness of the water, which seemed to be rapidly approaching us! Soon a small black object developed into a human head; next the arms and shoulders appeared, and, aided by the legs appertaining thereto, scaled our ship's side with cat-like agility.

My hand went to my hip-pocket as I demanded what the intruder wanted; whilst the Shantung man's exclamation of surprise and alarm is not 'No shoot! no shoot, capitan!' translatable. cried our solitary boarder, a smart-looking lad enough, with the salt water streaming from his 'My belong flend; my father—he naked body. all the same tepo before—makee send me say more better you clear our chop-chop, 'cos too much lallalong [pirates] have got this side. Savey?' The lad then went on to tell me that his father had been tepo or headman before the pirates got the control of the place, and he eagerly assured me that if I would come ashore he would give me all the information and assistance he could. Of course I went.

However, the very valuable information I obtained does not concern the present story; but I may mention that as it was considered unsafe for the youth who had swum off and warned us to remain on the island, I got him taken on as a lukong on my return. As soon as I got on board again I carefully examined the guns and small arms, and had an awning damped and stretched over our deck, turtle-back fashion, so that if a volley of stink-pots preceded the rush of boarders from the piratical craft those ugly missiles would roll off it harmlessly into the sea; for those horrible projectiles, when properly made and skilfully thrown, are very deadly in their effect, as their poisonous fumes will clear a deck, whilst a composition they often contain, if it falls on a man, will burn away the flesh from the bones.

The guns had been double-shotted, and I now had them crammed to the muzzle with tins of iron gingal bullets which I had found would burst at just about a hundred yards range. I next told off a dozen of my men who were good shots with a Snider carbine to keep watch, whilst my coxswain was stationed at the grass cable with a sharp axe.

Then, having done all I could, I sat down against the foremast to take on perhaps the most nerve-trying of all ordeals-watching and waiting in darkness and silence for eighty or a hundred desperadoes to spring upon the deck from some swiftly moving, phantom-like craft that had crept up alongside out of the surrounding blackness. Nor was this rendered any the more pleasant by the reflection that if I had miscalculated or blundered, some sixty lives might be needlessly But at last, in that dreary hour before sacrificed. dawn which the pirates usually chose for their attacks, just as an almost irresistible feeling of drowsiness was creeping over me, a whispered, 'Have got, capitan,' from the Shantung man-who was credited with a cat-like capacity for seeing in the dark—roused me to quick attention. At first I could see nothing in the darkness, then almost dense enough to be felt, nor hear anything but the lapping of the water against our vessel's sides. However, I passed an order quietly, and the men rose and silently stood at their stations. None too soon, though, for again there came those swirling sounds of parting water and creaking cordage that had been the sole warning of the pirates' approach the previous night. But my coxswain dealt a heavy blow with his sharp axe, and the severed grass cable by which the Fortunate Venture had been riding went flying over the bows at lightning speed. The men at the ropes and halyards hauled with a will, the great sails groaned and creaked, and, catching a light breeze as they rose, our craft gathered way and glided through the smooth water toward the entrance just in the very nick of time to dodge the rush of two narrow, wicked-looking craft whose long hulls and lofty sails now stood out from the surrounding blackness, their bows crowded with pirates, who had missed their chance just by a ship's-length to spring on board us.

As they sped past, savage yells, foul oaths, and threats were borne back to us across the silent night. Then suddenly there came a flash and a loud report, followed by a tearing and rending sound overhead, and a shower of splinters flew on deck from smashed rails and 'sideboards.' That was enough for me. I quickly hoisted the colonial flag, and, sighting at a hundred yards, gave the order to fire, the straining tackles of the heavily charged guns and the metallic ring of the Snider reports being answered by crashes and cries on board the nearest pirate, which very

soon sheered off to a more respectful distance, a second shot from their after-gun, as they did so, pitting our deck with their mixed shot (Chinese grape) and scoring sundry white blazes on our varnished teak sides.

Then, before any snake-boats from the shore could take a hand, I ordered the Shantung man, who was at the helm, to steer her out to sea—a very ticklish job, by the way, in the darkness, intensified as it was by the deep shadow of the high rocks, for any but those who knew the narrow channel.

The pirates quickly followed us, and were only a quarter of a mile or so astern when we had cleared the entrance. Outside, the blackness of night had begun to give way to the gray light of early dawn, and that was all in favour of our superior weapons and discipline. My one anxiety, indeed, now was as to the whereabouts of the other two piratical craft, said to be larger and more heavily armed; and this decided me to

force the fighting then and there.

Whilst the vessel that we had peppered so liberally seemed inclined to 'hang in the wind,' I had the Fortunate Venture headed for her consort, apparently the more dangerous of the two. Up till now I had seen no sign of the 'female demon' or of Semala, the Macao-Portuguese 'official;' for certainly, so far as I could distinguish objects by the light of the cluster of 'demon' candles burning before the altar in the pirate's stern, only tankars had been handling her. So I gave orders to bout ship and run the more distant pirates on board; and a slant of wind, then veering with all the signs of a coming blow, favouring us, we ran up alongside her, and managed to jam our stem into the overhanging woodwork on the pirate's quarter; so that, her after-sails fouling ours, no stink-pots could be thrown from them.

The Hingti men meanwhile made no attempt to prevent our closing. When, however, in the dim light of early dawn, I saw the reason, I confess that I felt disposed to pinch myself and rub my eyes to make sure that I was awake. For, to the evident dismay of my men-as I saw with disgust—there appeared at the pirate's helm a good-looking young woman whose long black hair, worn in a fringe on her forehead, hung down her back in a broad plait that reached to her waist. Her complexion, even in that imperfect light, was brilliant with Chinese face-powder and rouge. Her costume consisted of a blue silk jacket over a white silk one, loose blue silk trousers, and European shoes; whilst jade and silver bangles, anklets, and ear-rings contrasted oddly with a Chinese double-barrelled pistol and a long, broad-bladed dagger worn in her sash. The flame of the demon candles on the roof of the joss-house aft, near which she stood, fell upon two very serviceable steel-headed spears, one of which doubtless she intended to use for our benefit; a helmsman who stood beside her, without touching the tiller-ropes, doubtless accounting for the other.

Quickly pulling myself together, I snatched up a Snider carbine from the hatch and covered the 'female demon' at point-blank range; but for the life of me I could not pot that young woman in cold blood, savage murderess though she might be. So, lowering the carbine, I turned, and instead pulled the lanyard of the bow gun, sending its contents clean through the pirate's side, and the next minute we went rasping and grinding along it, my men putting in a volley from their Sniders at point-blank range, though as they did so I heard their muttered misgivings as to the 'female demon' having turned my carbine's muzzle aside by her 'spells'!

When the smoke of the discharge cleared off

When the smoke of the discharge cleared off I saw by the light of our lanterns and the pirate's demon candles this female desperado hounding on her men to rush our deck, only to be quickly beaten back, with my men climbing across in hot pursuit. Then for a minute or two the pirates held their ground, till discipline and better weapons told their tale. Then, despite the curses and threats of their nearly frantic leader, they sprang over the rail and swam for the shore, the flashes of phosphorus in the water making capital marks for our Sniders. Some seven or eight of the pirates, who had thrown down their spears and bolted below with their leader and another woman, were trapped like

rats in the dark hold.

Then, as I hauled down the triangular red flag under which the pirates had fought, and hoisted the colonial one in its stead, I saw the other Hingti craft crowding on all sail to get clear, she having by this time made out our real character. So, as it was useless to attempt to follow up the pirates who had escaped into such a hornet's nest in Chinese territory as Samun, I contented myself with putting a dozen men on board the captured vessel, and ordering the helmsman to stick as close to the stern of the Fortunate Venture as he could. Then hoisting every scrap of sail that would draw, we commenced that most unsatisfactory of all pursuits, a stern chase of an enemy that was our match in speed and had a start of over a quarter of a mile. The breeze, too, as we got from under the shelter of the land, first freshened and then started to blow heavily, whilst the nasty sea that quickly rose compelled me to have the guns secured. The light sails had all come off our vessel by this time, and the great fanlike mat ones had to be lowered to half their usual spread in both ships. Still, though we held our ground, I found that I could by no means decrease the gap that separated us; the vessels were too evenly matched for that. Once, when I had dropped their helmsman with a Snider bullet, I thought we had them; but the smartness of the second tankar at the pirate's tiller saved the situation; whilst, although halfa-dozen of my best shots never left off pumping lead into the stern of the pirate craft from the coigns of vantage forward into which they had jammed themselves, the long chase continued without either craft ever seeming to gain a yard Apparently the pirates were on the other. making for some rendezvous in the vicinity of Hong-kong, or else they expected to fall in with another pair of their vessels on the course they were then steering. So hour after hour passed without any change, the only happening being that the pirates got a broadside from a passing mandarin junk and a similar compliment from a very large armed trader that had apparently recognised their craft. Neither vessel's fire, however, crippled them, most of the shot apparently falling short.

I now began to fear that I should lose the chase in the darkness that suddenly sets in after sunset. It came as a complete surprise, therefore, when, just off the mainland of China, and close to Koulung, we found the pirates were deliberately running their craft ashore, and as she grounded jumping overboard with their weapons and as much of the plunder their vessel contained as they could carry and wade to shore with! Three or four of their number, with the master, who incautiously attempted to get a sampan loaded with bales of silk and cotton ashore, were cut off by my men. But I dared not fire on those who had reached the sandy beach, lest we should shoot some unlucky villager or farm labourer, several of whom stood stupidly staring at this unexpected and unwelcome invasion of their quiet little However, we soon got the beached craft off the smooth sand on which she had been run; and the two vessels, with the dreaded 'female demon' and some of her smartest tankars, besides a considerable amount of plunder, mostly silk and cotton goods, constituted a pretty good haul, considering the risky nature of the job. Indeed, had the pirates not been taken so completely by surprise, the capture might very well have been the other way about! Shortly afterwards the 'female demon,' the other woman who was in her service, and the rest of the prisoners were duly brought before the Hon. C. May, Senior Magistrate of Hong-kong, and were committed by him for trial before Sir John Smale, the Chief-Justice, at the Supreme Court. But the Chinese Government claimed the prisoners on some points of jurisdiction, and then came the most extraordinary part of this affair. stead of the 'female demon' being beheaded with the rest of the pirates at the executionground in Canton, report had it that a very rich man, 'attracted by her spells'-these being doubtless her good looks-bought her from the mandarin in whose custody she then was for a very large sum in silver, in order to make her his wife! Of course there used to be no difficulty, in many cases at least, for any one sentenced to death who could afford to pay for a substitute in finding one; and on this occasion no doubt mandarin, mistress, female servant, and payer of the sum the substitute required to insure her spirit's happiness in the next world and that of any near relatives in this, were all equally satisfied with the arrangement. Still, it seemed to me then, as perhaps it may do to the reader now, that the wealthy purchaser of the 'female demon' for 'her weight in silver' was likely to get a very bad return from his investment. Of course as to these latter proceedings I have only the local gossip to go by; but, then, in the official yamens of Far Cathay very little happens without some 'bird of the air carrying the matter' to folks outside them.

THE END.

THE TOWERS OF SILENCE.

By G. ROBERTSON-GLASGOW.

THERE is something suggestive, something dignified and reserved, in the very name of those great stone mausoleums which are the burial vaults of the Parsees—the Towers of Silence—not beautiful with the dew and freshness and divine peace of our own 'God's Acres,' but typifying the austerity and seclusion and loneliness in which all human souls must die.

The Towers of Silence in Bombay lie above the town, and from all the terraces of the pleasant garden can be seen the surrounding sea and the ships coming and going with the tide. The grounds are carefully and well planted, and there are broad, shaded walks, where at intervals notices are posted up saying that strangers must go no farther, for round the Towers the ground is considered sacred, and only the dead and the mourners are admitted into its privacy.

The ground, certainly the most beautiful spot in Bombay, was bought by the Parsee community on their first arrival from Gujerat more than two hundred years ago. They brought with them the sacred fire which is never allowed to go out, and which is enshrined in the little temple near the gates, where the first part of the funeral services is performed. From a narrow window in the walls the light ever shines steadily on the dusky shadows of the Towers.

There are always three circles in the Towers—for men, for women, and for children—and they are spoken of as the Circles of Deeds, Words, and Thoughts—a sort of poetic breath from the grim tragedy of those impassable and silent watchers of the dead. All are alike in their

death, rich and poor, young and old; there is no distinction of rank or riches. 'Naked came ye into the world, and naked shall ye go out of it,' is literally interpreted; and when the bier, with its shrouded carriers, passes the last resting-place—a slab of marble in the broad, straight path—the poor mortal leaves behind his social rank and all his worldly glory, and stands merely a naked soul before an unbiassed Judge.

When the last death-struggle commences, and there is, humanly speaking, no hope of life, the death ceremonies begin; and all these ceremonies are intended for the greater protection of the living and the least chance of contagion from the dead. A line is chalked round the bed on which the sufferer lies, and no one except the hired attendants may pass the line. They, dressed only in white linen garments, perform all the last sacred rites and offices, and lay the body on the light open bier on which it is carried to the gardens. Even the hands of the bearers are covered, so that there may be no fear of contact, and the mourners walk behind the bier, the women being very seldom present.

After a prayer on the steps of the temple, the body is carried down the broad path to the large slab of stone which stands about a hundred paces from the Tower. On this it is laid, and the face of the dead uncovered by the bearers so that the relatives and friends may look for the last time on their loved one from a little Then the bier is slowly carried on to the Tower, the little door is opened, the bearers pass in with their burden, and are seen no more. With long iron hooks they drag the clothes, fashioned for the purpose, off the body, and then, leaving the dead in his own circle, they pass out by another door, and returning to the temple, either hang up their white garments for future use or burn them.

The funeral I saw was that of a child—a little Thought that seemed too small and frail for such a tremendous sepulchre; but one feels with comfort that a Winged Thought cannot be contained in any Tower of Silence, and the blue sky leaning so closely over it makes it appear a very little step to heaven.

I cannot bear to speak of the vultures which ring the Towers. It almost seems a desecration of the silence and the sacredness of death to see the hideous means which takes the place of the gentle acts of nature when dust returns to dust. But here, too, the Parsees plead the advantage of their method from a sanitary point of view. Perhaps they are right; but one feels glad that the mourners did not hear the flappings of those heavy wings.

The Towers are costly buildings, and are generally built and presented to the community by wealthy citizens. There is a good deal of masonry both above and below the ground, but they are not of a great height, and have only the one small door of entrance. Above it, rather to

the right, is a small round aperture, so arranged that the light of the sacred fire penetrates through it into the very innermost circle of the Tower. One Tower is reserved for suicides, but it is a small one, not often used, for the Parsees are a generous race in their dealings with each other, and would not willingly see any one in trouble without lending a helping hand.

One of the most curious features of a Parsee funeral is the presence of a 'four-eyed dog,' as it is called, which is always made to look upon the corpse, and is then led in front of the procession as far as the last resting-place. The origin of the custom seems to be rather obscure, and the popular idea is that the dog shows the spirit of the dead the path to heaven. But I believe there is a very old Persian superstition that the dogs of this breed—they are always white, with yellow spots on the face near the eyes—exercise a curious mesmeric influence on human beings, and could discover at once if death were really present or not.

No doubt the happy dead sleep very quietly in the Silence of the Towers, those grim and faithful guardians of mortality. That great Old World community has kept its religious and national customs intact in the midst of an alien race since they were given to them by Zoroaster himself when the world was young. For the Deeds and Words and Thoughts of all the past generations keep alive the sacred fire as surely as the care and watchfulness of their living descendants.

THE QUEST.

WE went across the hills at dawn,
At night we passed the seas;
Through clouds and mists we travelled on
Beyond the battling breeze.

We stayed not foot by land or shore; We spanned great floods; we chased The flaming sun that glimmered o'er The desert's golden waste.

A thing of loveliness and light, Fair, fleeting, lured us on; It lurked within the sea at night, It haunted us at dawn.

It trembled on the mountain's peak,
It sang across the wood;
Though still through misty years we seek,
The charm doth still elude.

Yet here and there in that long quest, A magic moment brings A subtle sense of something blest, A breathless beat of wings;

And, seeking still, we wander on If so perchance there be That vision in the melting dawn, That light upon the sea.

MARY M. CURCHOD (MYRA).

ALGIERS.

WHEN GEORGE THE THIRD WAS

By Sir HENRY LUCY.

WANDERING through a silent street in a tranquil town in Kent, I came upon rare treasure trove. I found it when turning over some musty papers in a bookseller's shop, entered by stumbling down an unsuspected step, the customer, when he rises from his astonished knee, banging his head against a low-beamed That is a detail.

My prize was a copy of one of the oldest provincial newspapers printed in the English tongue -none of your reprints, as is the pleasing custom with weekly newspapers celebrating their fiftieth or one hundredth birthday. My paper—the Kentish Gazette, price threepence, published on Saturday, 18th January 1783—is the actual sheet thumbed by men and women, some of them dead these one hundred and thirty years. The yellow, faded sheet of four pages measures twelve inches by eighteen. It carries at its head the coats of arms of the county of Kent and of the city of Canterbury. It is numbered 1520; and, being a bi-weekly, its first appearance is thus carried back some fifteen years earlier than the date it bears.

At the time of its appearance George the Third was king. The Earl of Shelburne, afterwards Marquis of Lansdowne, ancestor of the leader of the Opposition in the House of Lords to-day, was Prime Minister. William Pitt was Chancellor of the Exchequer. Preliminary peace negotiations had been recently signed with the United States, which had been at war with the mother country since the solemn promulgation of the Declaration of Independence.

Boldly displayed at the top of a column on the front page is an advertisement which runs 25 follows:

On Saturday the 4th of January, 1783, was published, Ornamented with a new and beautiful Frontispiece,

> NUMB. I. Of MR. CHAMBERS's

CYCLOPÆDIA;

UNIVERSAL DICTIONARY

ARTS AND SCIENCES: [All Rights Reserved.] No. 160.-Vol. IV.

WITH THE SUPPLEMENT and MODERN IMPROVEMENTS, incorporated in one ALPHABET

ABRAHAM REES, D.D. IN FOUR VOLUMES. Ilinstrated with a great Number of Copper-plates.

CONDITION &

I. The Work will make Four Large Volumes in Folio, handsomely printed with a New Letter on

a Fine Demy Paper.

II. Three Sheets shall be delivered every Week, stitched in Blue Paper, Price Sixpence.

III. In the Course of the Work will be given, gratis, a great Variety of new Engravings, to illustrate

the Improvements made in the present Edition.

IV. With Number I. is given a New and Elegant Frontispiece, designed by Dodd, and engraved by Cook.

V. The subsequent Numbers will be regularly published every Week, till the Work is completed.

Printed for T. LONGMAN, No. 39, Pater-noster-row,

And sold by Simmons and Kirkby, and Flackton and Marrable, Canterbury; T. Fisher, Rochester; W. Gillman, Chatham; J. Sharp, Deal; G. Ledger, Dover; S. Doorne, Faversham; by all the booksellers in Kent and Sussex, and may be had, carriage-free, of the Newsmen who deliver the Kentish Gazette, and the Rest of the Proprietors.

Vol. I. and II. which contain 191 Numbers (Price 51 in Boards) are completed; and as a great Part of the third Volume is already published, Purchasers may be supplied with as many Numbers weekly, as suit their Inclination or Convenience.

The Public have already decided upon the Merita of the Work, by the uncommon Approbation it has received; and the Editor and Proprietors return their grateful Acknowledgements to the Purchasers for its rapid and increasing Sale.

The parliamentary session had not yet opened; but Ministers, notably young Pitt, were hard at work preparing their programme. 'The Chancellor of the Exchequer is attempting a reformation in the management of the Customs which will at once tend to expedite business and save money to the nation. In the pursuit of this plan he holds conferences continually with most of the senior officers, and gives such instructions for extraordinary accounts as amount to something more than a mere official knowledge.'

Other work the Chancellor had in hand was the state of the National Debt, hoping 'to contrive some plan by which it might be put into a regular course of Payment.' He also contemplated dealing with the question of Parliamentary

DECEMBER 20, 1913.

Reform. The urgent need of this is represented by an interesting table set forth in the Kentish Gazette, which shows that not less than fifty-six members of the sitting House of Commons had been returned by three hundred and fifty-four voters. In two boroughs, Newton in the Isle of Wight and Old Sarum, a single voter returned two In Marlborough, the constituency members. consisted of two free and independent electors, who sent to Westminster a member apiece. Malmesbury and Buckingham, each represented by two votes in the House of Commons, counted seven electors. Brander, long since wiped off the parliamentary slate, had eight voters; Camelford and East Grinstead each ten; Boffiney, Banbury, and Gatton eleven.

The Budget was still afar off, but it was stated that the Chancellor contemplated 'new taxes on dogs and old bachelors.' The dog-tax we have long been familiar with. Up to the present date

old bachelors go free.

In addition to trouble with the United States, Britain was at war with France and Spain. The consequence was great activity at the Admiralty. 'Within this month past,' we read, 'the navy board has contracted for upwards of six thousand five hundred tons of shipping, and are still in want of near thirty transports more, either to convey homewards our transatlantic troops and stores, or to forward out others, to make a peace more sure than it appears in common reason to be at present.'

Commerce at sea was possible only under the protection of men-of-war. 'On Thursday an express arrived at the Admiralty from Portsmouth with the agreeable news of the safe arrival at Spithead of his Majesty's ships the Arethusa, of thirty-eight guns, Sir Richard Pearson; the Eolus, of thirty-two guns, Captain Collins; and the Merlin sloop of twenty guns, Captain Lumsdale, with the fleet of merchantmen from Newfoundland and Lisbon under their convoy.'

Crews were supplied by the agency of pressgangs. 'The press was so hot on Friday night that they took every sailor they could meet,

not withstanding their protections.

Amid these pressing anxieties the Lords Commissioners of the Admiralty found time to devise a new uniform for officers. Mr Winston Churchill, always ready to consider suggestions, will read with interest the following particulars which received the gracious approval of King George. The full dress of an Admiral was thus ordained: 'A blue Cloth Coat, with White Cuffs; White Waistcoat and Breeches; the Coat and Waistcoat to be embroidered with Gold, in Pattern and Description the same as that worn by the Generals of his Majesty's Army; three Rows of Embroidery upon the Cuff. The Vice-Admiral's Ditto; with Embroidery the same as that worn by Lieutenant-Generals; two Rows of Embroidery on the Cuff. The Rear-Admiral's Ditto; with Embroidery the same as that worn by Major-Generals; One Row of Embroidery on the Cuff. Buttons the same Pattern as now in use.'

For undress, Admirals wore 'a Blue Cloth Frock, with Blue Cuff and Lappels; embroidered Button-holes like those now in use, from the Top to the Bottom of the Lappel, at equal Distance, and three on the Cuff. Vice-Admiral's Ditto; with Button-holes three and three. Rear-Admiral's Ditto; with Button-holes two and two. Plain White Waistcoats and Breeches. Buttons of the same Pattern as are now in use.' It was considerately provided that flag-officers would be permitted, if they pleased, to wear their old uniforms to the end of the current year.

His Majesty was personally inclined to be a little dressy. On the Thursday evening preceding publication of my copy of the Kentish Gazette, the King and Queen, accompanied by His Royal Highness, and attended by an imposing suite, including the Lord-in-Waiting, Gold Stick, and the Vice-Chamberlain, honoured Drury Lane Theatre with their presence to see Venice Preserved. His Majesty was dressed in a suit of sky-blue laced with gold; Her Majesty in a blue silk, richly ornamented with gold flowers. 'His Royal Highness the Prince of Wales wore a most superb dress, of purple velvet embroidered with silver in the stile of infinite taste and magnificence.'

'Mrs Siddons,' we learn, 'who performed the Character of "Belvedera," was much indisposed previous to going on the stage; and it is with extreme concern we inform the public that after the curtain dropped at the end of the 5th Act, this excellent woman was so very ill as not to be capable of walking to her dressing-room without support. Notwithstanding her disagreeable situation, she went through the part as if inspired. Our amiable Queen was so affected at her performance, that his Majesty seemed alarmed, and often diverted her attention from situations and passages that were likely to distress her.'

Readers of Fanny Burney's life at Court, with its vivid thumb-nail sketches of amiable, fussy King George, with his eternal 'What?' What?'

will realise this domestic scene.

Among miscellaneous paragraphs we get glimpses of domestic doings in England at the close of the eighteenth century. Here, for example, is Henry Spencer, whose name is displayed in large type, forasmuch as he ran away and left his wife and family chargeable to the parish of Lenham, was at the date 'about 36 Years of Age, about six feet high, round-shouldered, wears his hair rather curled, a thin Visage, and fresh coloured. Whoever will apprehend the said Person, or give an Account to the Parish Officers of Lenham aforesaid where he is, so soon as he can be brought to Justice shall receive Half-a-Guinea Reward.' Had it been possible for Henry to live to this day he would have been one hundred and sixty-six years old, and, I trust, a reformed character.

'On Friday morning the Right Hon. Lady Elizabeth Cavendish was safely delivered of a son and heir, at Burlington House, to the joy of that noble family.' This would be an ancestor of our lately dead and ever-respected eighth Duke of Devonshire, better known as Lord Hartington.

The highwayman and the burglar were, like the schoolmaster in Lord John Russell's time, 'abroad in the land.' 'On Monday evening last, as Mr Macro, of Barrow-hall, near Bury, was returning home on foot, about eight o'clock, he was stopt near his own house by a single highwayman on a brown horse with a waggoner's frock on [the highwayman, not the brown horse, who, with an oath, demanded his money. Mr Macro, seeing a horse-pistol in his hand, immediately struck at it with his walking-stick; but, missing his aim, the highwayman fired at him, and providentially only grazed his cheek It was so and singed his coat on his shoulder. near his own house where he was attacked that the report of the pistol was heard by his family. The man, as soon as he perceived that Mr Macro was not wounded, rode off with great haste into the open fields without his booty, which would have been considerable, as Mr Macro had been at the "Red Lion," collecting the tythes of the parish. Mr Macro went the next morning to the place, to see if he could find out any marks of the person being that way, when he discovered the track of a horse with a bar-shoe, which he traced to "Kentford Bull," where he found it in the stable, and the rider in the kitchen, whom he apprehended, and proving to be a suspicious person belonging to a gang of smugglers, brought him to Bury gaol; and there appearing upon his examination strong circumstances of his guilt, he was detained in custody.'

'Friday morning, between one and two o'clock, five villains broke into the house of —— Hanfon, Esq., at Low Layton in Essex, and after continuing therein about two hours, carried off a great quantity of linen, wearing-apparel, &c., to a considerable amount. It is greatly to be regretted that two men-servants, who slept at the top of the house, although alarmed when they first entered, and having a blunderbuss and gun loaded in their bedroom, with plenty of ammunition, never made the least opposition.'

The current price of wheat was six shillings and fourpence for eight gallons, coals thirty-seven shillings and aixpence per chaldron, fat mutton fourpence to fourpence halfpenny a pound. Three per cent. Consols stood at sixty-two pounds ten shillings, a fact testifying to the deplorably low state of British credit when George the Third was king.

A KNIGHT ON WHEELS.

CHAPTER III.—SAMSON AND DELILAH.

THE little girl continued to sit upon the top rail of the gate, with her heels on the second, and her long black legs tucked up beneath her. She had taken off her jacket, and was using it as a cushion to mitigate the hardness of her seat. She was dressed in a blue cotton frock, which was gathered in round her waist with a shiny red-leather belt. At least Philip considered it red; the little girl would have explained that it was cerise.

She also continued to smile. Her teeth were very small and regular, her eyes were soft and brown, and some of her hair had blown up across the front of her tam-o'-shanter, which matched the colour of her belt.

Philip stood stock-still, and surveyed her a little less severely.

'Hallo, boy!' said the little girl again.
'Hallo!' said Philip in guarded tones.

'I saw you on Sunday,' the little girl informed him.

'Yes, I know,' said Philip coldly, and prepared to pass on. With the mention of Sunday, Uncle Joseph's warning had recurred to him.

'Don't go,' said the small siren on the gate.

'I think I will,' said Philip.

'Why?'

Philip hesitated. Uncle Joseph had trained

him always to say exactly what he thought, and never to make excuses. But he experienced a curious difficulty in informing this little creature that he was leaving her because she belonged to a dangerous and unscrupulous class of the community. It was the first stirring of chivalry within him. So he did not reply, but began to move away rather sneepishly.

The little girl promptly unlimbered her sternchasers, and the scornful accusation rang out,

'You're shy!'

Into an ordinary boy such an insult would have burned like acid; but Philip merely said to himself thoughtfully, as he walked away, 'I wonder if I am shy.' Then presently he decided, 'No, I'm not. I can't be, because I wanted to stay and talk to her.'

He walked on a few yards, and then paused again. Boy nature, long dormant, was struggling vigorously to the surface. 'I won't be called shy!' he said to himself hotly. He turned and walked quickly back.

The little girl was still sitting on the gate, studiously admiring the sunset.

Once more Philip stood before her. 'I say,' he said nervously, 'I'm not shy.'

The little girl looked down languidly. 'Have you come back again?' she inquired.

'Yes,' said Philip, scarlet.

'Why?'

'I wanted to tell you,' pursued Philip dog-

gedly, 'that I wasn't shy just now.'

The little girl nodded her head. 'I see,' she said coldly. 'You were not shy, only rude. Is that it?'

The greater part of Philip's short life had been spent, as the reader knows, in imbibing the principle that a man not only may, but if he values his soul must, be rude to women upon all occasions. It is, therefore, regrettable to have to record that at this point—at the very first encounter with the enemy-Philip threw his principles overboard. 'Oh no,' he said in genuine distress, 'I didn't mean to be rude to you. It—it was a different reason.'

The little girl made no reply for a moment, but stood up on her heels and unrolled her cushion to double its former width. 'Come up here and tell me about it,' she said maternally,

patting the seat she had prepared.

Philip began to climb the gate. Then he

deliberately stepped down again.

'Aren't you coming?' asked the little girl, with the least shade of anxiety in her voice.

'Yes,' said Philip. 'But I'll come up on the other side of you. Then I shall be able to keep the wind off you a bit. It's rather cold.

And he did so. Poor Uncle Joseph!

Now they were on the gate together, side by side, actually touching. Philip, feeling slightly dazed, chiefly noted the little girl's hands, which were clasped round her knees. His own hands were broad, and inclined to be horny; hers were slim, with long fingers.

The little girl turned to him with a quick, confiding smile. 'Now tell me why!' she com-

manded.

'Why what?' asked Philip reluctantly.

'Why you went away just now.'

Philip took a deep breath, and embarked upon the task of relegating this small but dangerous animal to her proper place in the universe. was-it was what Uncle Joseph said,' he explained lamely.

'Who is Uncle Joseph?'

'He—I live with him."

'Haven't you got a father or a mother?' A pair of very kind brown eyes were turned full upon him.

'No.'

'Poor boy!'

To Philip's acute distress, a small arm was slipped within his own.

I have a father and a mother,' said the little girl. 'You may come and see them if you like.'

Philip, who intended to cut the whole connection as soon as he could decently escape from the gate, thanked her politely.

'Only, don't come without telling me,' continued his admonitress, 'because father isn't always in a good temper.'

Philip thought that he might safely promise

'Now tell me what Uncle Joseph said,' resumed the little girl. 'What is your name?' she added, before the narrative could proceed.

'Philip.'

'Philip what?' 'Philip Meldrum.'

'Shall I call you Phil?' inquired the lady, with a friendly smile.

'Yes, please,' replied Philip, feeling greatly surprised at himself.

There was a pause. Philip became dimly conscious that something was expected of himsomething that had nothing to do with Uncle Joseph. He turned to his companion for en-Her face was slightly flushed, and lightenment. her eyes met his shyly.

'What is your name?' he inquired cautiously.

'Marguerite Evelyn Leslie Falconer,' replied the little girl in tones of intense relief.

'Oh,' said Philip, 'do they call you all that?' 'No; I am usually called Peggy. Sometimes Pegs.'

Why?

Miss Falconer sighed indulgently. 'Peggy is the short for Marguerite,' she explained. 'Didn't you know?'

'No,' said Philip. He was about to proceed to a further confession, when the little girl said graciously, 'You may call me Peggy if you like.'

Here Philip, whose moral stamina seemed to be crumbling altogether, took his second downward 'I shall call you Pegs,' he said boldly.

'All right,' replied the lady so designated.

'Now tell me what Uncle Joseph said.'

'Uncle Joseph,' began Philip once more, 'was with me on Sunday, when you were sitting here.'

'Was I?' inquired Peggy with a touch of Then she continued inconsequently, hauteur. 'I remember him quite well. Go on.'

'He saw you,' continued the hapless Philip,

'when you smiled at me.'

Miss Falconer's slim body stiffened. 'O-o -o-h!' she gasped. 'How can you say such a thing! I never did!'

Poor Philip, who had yet to learn the lesson that feminine indiscretions must always be accepted without comment and never again referred to without direct invitation, merely reiterated his tactless statement. 'But you did,' he said. 'Or perhaps,' he added desperately, for Peggy's eyes were almost tearful, 'you were only smiling to yourself about something.

To his profound astonishment, this lame suggestion was accepted. Miss Falconer nodded. Her self-respect was saved. 'Yes,' she said,

'that was it. Go on.

'And when Uncle Joseph saw you smilingto yourself-he said that women always did that. He said they couldn't help it. It was a-a prebby-a prebby-something instinct. can't remember the word.'

'Presbyterian?' suggested Miss Falconer help-

fully. 'Our cook is one.'

'Something like that. Yes, I believe it was that,' said Philip. He was quite sure it was not, but he was anxious not to offend again. 'He said it was due to a-a Presbyterian instinct. He thinks women ought to be avoided.'

'Why?' asked Peggy, deeply interested.

'He doesn't like them,' explained Philip. He Half-an-hour ago he spoke quite apologetically. would have set forth the doctrines of Uncle Joseph as matters of fact, not of opinion.

But Miss Falconer did not appear to be offended. She seemed rather pleased with Uncle 'I don't like women much myself,' she Joseph. announced. 'Except mother, of course. I like little girls best, and then little boys.' She squeezed Philip's arm in an ingratiating manner. 'But why doesn't Uncle Joseph like women? They can't do anything to him! They can't stop him doing nice things! They can't send him to bed!' concluded Miss Falconer bitterly. Evidently the memory of some despotic nurse was rankling. 'Did he ever tell you why?'

'Oh yes-often.' 'What does he say?'

'He says,' replied Philip, getting rapidly into his stride over long-familiar ground, 'that women are the disturbing and distracting force in Nature. They stray deliberately out of their own appointed sphere in order to interfere with and weaken the driving-force of the world-Man. They are a parry—parry—parrysitic growth, sapping the life out of the strongest tree. They are subject to no standard laws, and therefore upset the natural balance of Creation. They act from reason and not instinct. No, I think it is the other way round: they act from instinct and not from reason. They have no breadth of view or sense of proportion. They argue from the particular to the general; and in all argument they habitually beg the question and shift their ground if worsted. They cannot organise or Their own direct; they only scheme and plot. overpowering instinct is the Prebby—Presbyterian instinct—the instinct of plunder—to obtain from Man the wherewithal to deck their own persons with extravagant and insanitary finery. This they do not to gratify man, but to mortify one another. A man who would perform his life's work untravelled—no, untrammelled—must avoid women at all costs. At least,' concluded Philip traitorously, 'that is what Uncle Joseph says.'

Miss Falconer puckered her small brow. dently she declined to go all the way with Uncle Joseph in his views. 'I don't understand it all,' she said frankly; 'but some of it sounds pretty silly. Is your uncle Joseph a nice man? Do you like him?

'Yes,' said Philip stoutly. 'He is very kind

'He sounds a funny man,' mused Peggy. 'I shall talk to mother about him. I must go now. It is getting dark.' She slipped off the gate, and Philip perceived, for the first time, that for all her youthfulness she was half-a-head taller than himself.

'Where do you live?' inquired Philip, forgetting his previous intentions.

'Over there, where the lamp-posts are. Goodnight, Phil!'

'Good-night, Pegs!'

The children shook hands gravely. desired most ardently to ask the same question; but Philip was restrained by his principles (now returning hurriedly to duty), and Miss Peggy by maidenly reserve. But each secretly made the same resolution at the same moment.

Philip found his uncle smoking a pipe in a big arm-chair before the study fire. He was jotting

down calculations on a blotting-pad.

'The opposite sex has its uses, Philip,' he said. 'To-day, thanks to the sentimental credulity of a number of estimable but credulous females, we have raked in forty-seven pounds ten. With that sum we shall be able to do some real good.'

'How are you going to spend it this week,

Uncle Joseph?' asked Philip.

'Considering the season of the year, I think the best thing I can do is to devote practically all of it to Christmas benevolences—chiefly of the coal-and-blanket order. I have no quarrel with the very young, and I don't like to think of any child, male or female, going hungry or cold on Christmas Day. You can do a lot with fortyseven pounds ten, Philip. For about fourpence you can distend a small stomach to its utmost capacity, and you can wrap it up and keep it warm for very little more. What a blessed thing it is that these misguided females have some one to divert their foolish offerings into wise channels! This very week, but for us, forty-seven pounds ten would have dropped into the banking-account of some professional beggar, or gone to bolster up some perfectly impossible enterprise, such as the overthrow of the Church of Rome or the conversion of the Jews.

Uncle Joseph paused and laughed whimsically. 'There is a touch of humour about it all,' he said. 'It would appeal to the editor of the Searchlight. I must tell him all about it some day—when I go out of business! Yes, we'll stick to coaland-blanket charities at present, Philip. After Christmas I want to tackle the question of emigration again. Now get your writing-pad. I want to dictate rough copies of the letters for next Monday.'

Uncle Joseph filled a fresh pipe, and began to stimulate his epistolary faculties by walking about the room. Philip silently took his seat at the table.

Aubrey Buck must go, was Uncle Joseph's t announcement. 'Let us make a start first announcement. upon his successor. His name shall be Arthur Brown, M.A., late Fellow of Trinity College, Cambridge. Trinity is so big that it is very hard to trace all its late Fellows, especially if their name is Brown. John's is good too, but we did very well with a Johnian missionary to Central Patagonia a couple of years ago, and we must divide our favours impartially. Now take this down:

'Dear Madam,-Not long ago I was, like yourself, a personality in the world of letters. Not of letters such as this—which (between you and I) it is with the utmost repugnance that I have brought myself to sit down and address to a fellow-scribe '-

['That's a purposely turgid and ungrammatical sentence, but she won't know. It

does me good to dictate it.']

'but of the great world of Literature, where the rarest spirits assemble and meet together'-

['That's out of the Prayer Book, and fits in rather well there.']

spirits that live as gods, and take sweet counsel

together.

'That last bit is King David; but she will probably think it is Ella Wheeler Wilcox.']

'The busy life that you lead, as one of the protagonists of modern thought'-

['She won't know what a protagonist is,

but it will please her to be called one.' 'deprives me of the hope that you can possibly have found time to glance through my poor works. Yet, believe me, even I have had my little circle. I too have walked in the groves of the Academy with my cluster of disciples, striving to contribute my mite to the sum-total of our knowledge.

['Now we might come to the point, I

think.']

But my course is run, my torch extinguished. Two years ago I was attacked by paralysis of the lower limbs'

['Always say "lower limbs" when talking

to a lady, Philip.']

*lower limbs, followed by general prostration of the entire system. I am now sufficiently recovered to don my armour once more; but, alas! my occupation is gone. My Fellowship expired six months ago, and has not been renewed.

My pupils are dispersed to the corners of the earth. Entirely without private means, I have migrated to London, where I am endeavouring to eke out an existence in a populous but inexpensive quarter of the town—the existence of a retired scholar and gentleman, save the mark !-

['That's a good touch, Philip!']

'by clerical work.'

['No, don't put that. She will think clerical means something to do with the Church. Say "secretarial" instead.']

'Have you any typing you could give me to do? I hate asking, and I know that you know I hate asking; but there is a subconscious, subliminal bond, subjective and objective '-

['I don't know what that means, but it sounds splendid.'

'that links together all brothers of the pen; and I venture to hope that in appealing to you, of all our great brotherhood, I shall not appeal in vain.'

['We had better wind up with a classical quotation of some kind,' concluded Uncle Joseph. 'She will expect it from a Don with paralytic legs, I fancy. Reach me down that Juvenal, Philip. I have a notion.

Yes, here we are.']

'Possibly you may ask, and ask with justice, why the University has done nothing for me. I did make an appeal to the authorities; butwell, a man hates to have to appeal twice for a thing that should by rights be granted without appeal at all, and I desisted. The University is rich and respectable; I am worn-out and shabby. What could I do?

Plurima sunt quæ Non homines audent pertusa dicere læna.'

['Get that down right, Philip. She may take it to some educated person to get it translated.'

'What does it mean, Uncle Joseph?' asked Philip, carefully copying out the tag.

'It means, roughly, that a man with patches on his trousers cannot afford to ask for much. Now to wind up."

'So I pray you-not of your charity, but of your good-comradeship-to send me a little work to do. The remuneration I leave to you. I am too destitute, and possessin,—Yours fraternally,
'ARTHUR BROWN.' too destitute, and perhaps too proud, to drive a

'Put "Late Fellow of Trinity College, Cambridge." You can add the Islington address when James Nimmo has fixed it up. Then type it out. Do about seventy copies. I have been it out. Do about seventy copies. I have been going through the lady members of the Authors' Society, and have picked out most of its female geniuses. Now for next week's list for the Kind Young Hearts! Three or four of the old items can stand, particularly Popodoodlekos; he is a very lucrative old gentleman; but the others must come out. I shall not send the revised list, though, to your friend—what was that humorist's name?

'Mr Julius Mablethorpe,' said Philip. 'That's the man. Now I think of it, I have read some novels by him. I shall not send him the revised list, but I am grateful to him, all the same, for one or two useful hints. scheme for sending children to the seaside ought not to have gone in at this time of year. foolishness of the average female philanthropist is so stupendous that one grows careless. Instead, we will substitute a League of Playground Helpers, a band of interfering young women whose primary act of officiousness shall be to invade the East End and instruct slum children in the art of playing games scientifically and educatively. There's a great rage for that sort of thing just now; though how one can make a mud-pie, or play hop-scotch, or throw kittens into a canal scientifically and educatively beats me. Still, the idea is good for a few postal-orders.'

The list was completed, to a running accompaniment of this sort, and Philip began to put

away his writing materials.

Uncle Joseph glanced at the clock. 'There is just time for one more letter before dinner, he said. 'I am going to ring the changes on Tommy Smith a trifle. Next week, I think, instead of writing to grown-ups, he must send an ill-spelt but touching appeal to some little girls. About a dozen will do—the children of wealthy or titled widows. The difficulty will be to get hold of the brats' Christian names. However, we will work it somehow. We might say "Little Miss So-and-So," or, "The Little Girl Who Lives with Mrs So-and-So." Either will look childish and pretty. Just take this down, and we'll see how it sounds:

*DEAR LITTLE GIRL,—I am only a little boy

about your age, and my Daddy does not know I am writing to you.

['Put in spelling mistakes as usual.']
'My Daddy is a curate. We are very poor, and he has been ill for months. I often hear my mother crying in the night when she thinks we are all in bed asleep. I have no sister of my own, only a little baby brother. How I wish you were my sister. Then you might help me to earn some money for my father. Shall we pretend to be brother and sister, and then'-

'Hallo, Philip, old man! Getting tired?' Philip had stopped writing. He was gazing dully, fixedly, and rebelliously at the paper before him. His pencil dropped from his fingers.

For nearly three years he had been a faithful secretary and a willing amanuensis. He had performed his duties mechanically, without even considering the morality of his conduct or the feelings of his correspondents. Now, suddenly, he hated Uncle Joseph and all his works. 'Why?' he wondered.

(Continued on page 53).

MODERNISING THE MIDDLE EAST.

By HERBERT PICKLES.

PHE Baghdad Railway is slowly approaching completion; but owing to two great natural obstacles—the Taurus and the Amanus mountainranges-at least four or five years must elapse before the line is open for through traffic. But progress has been delayed by difficulties much more serious than those arising from physical features. Negotiations are in progress between the Governments of Germany and Turkey, and between each of these and that of Britain, with regard to the final section of the railway which joins the city of Baghdad to the Persian Gulf. Two other European Powers are also interested in the new line. These are Russia, whose influence is predominant in the northern part of Persia, and France, whose 'great interests in Syria are severely threatened by the Baghdad enterprise,' says the Gaulois.

The building of the railway is a German scheme, and its inception dates back to 1899, when a German company obtained a concession for the construction of a line from Konia, in Asia Minor, by way of Baghdad to the Persian Gulf. Konia was already in touch with the Bosporus by rail. The distance by railway from Konia to Baghdad is nine hundred miles. The first section has been constructed as far as Burgulu, and a company has been formed to carry it five

hundred and twenty miles farther.

Britain, France, and Russia opposed the scheme, but the work was commenced in 1903, and opposition to it has come to be regarded not only as useless, but also as unwise and unjust. The Potsdam agreement of 1910, acknowledging the rights and privileges of Russia in Asia Minor, won the support of the Russian Government. Britain was in a more difficult position. There was the probability that British investors would provide part of the capital required for the project; whilst, though Britain would make use of the railway if completed, she by no means required it as a commercial route to the Middle East. Opposition on this ground would be 'dog-in-themanger' policy, and, in addition to being foolish, would be certain to prove unsuccessful.

Our attention, therefore, became concentrated on the Persian Gulf, where we have had interests for two centuries, and British opposition developed into an endeavour to secure that the final section of the railway should be under The attitude assumed by British control. Britain during the early stages of the Baghdad scheme was probably the chief factor in producing the strained relations between Germany and ourselves over a number of years.

An important step was taken by Germany, however, in 1911, when she renounced her rights over the final section in return for the right to construct a branch line round the head of the Gulf of Alexandretta. Control of the final section thus became a matter for adjustment between Britain and Turkey. Negotiations are not yet completed, but they seem likely to be entirely successful, for the Turkish Government 'recognises the British Protectorate over Koweit (on the Gulf), and concedes the eventual right of the construction of a railway from Bassorah to Koweit;' and 'two British delegates at least

shall be appointed to the directorate of the Baghdad Railway in order to supervise all transactions and prevent discrimination in the

treatment of goods.'

The completion of the railway will provide means for a romantic journey. The centres of modern civilisation will be linked with the 'Cradle of the Human Race.' Communication will be established between Mesopotamia, a land of dead cities, and the west of Europe, the centre of life and commerce. No land has had a more glorious past than this, which contributed to the wealth of Babylon, Nineveh, and Baghdad; whilst no land has experienced such utter ruin. Babylon has disappeared. The very bricks of which its walls were built have been carried away, and many may be seen, stamped with the seal of Nebuchadnezzar, forming part of modern buildings in Baghdad. Nineveh exists merely as a ruin, a ruin partly excavated after interment for over two thousand years. For these there is no resurrection; but the third may yet regain some measure of the wealth and influence which were its portion under the rule of Haroun al Raschid.

In its palmiest days, a thousand years ago, Baghdad was the centre of Eastern trade and culture. Trade routes from Persia and the Far East, from the Levant and southern Europe, converged upon this city and made it the great mart of Asiatic products. The same convergence of roads has probably operated in later times, and gifted Mesopotamia with the mixture of tribes

and antagonistic creeds by which it is now characterised.

To-day Baghdad is but a shadow of its former self. Its population of two millions has dwindled to two hundred and twenty-five thousand. The desert rolls almost up to the walls of the city, for the elaborate system of canals which rendered the land capable of supporting a teeming population has been neglected. The physical conditions have not changed, however. The land which the Chaldeans transformed into a fruitful garden can be made once more to blossom as the rose. What irrigation has done in the Punjab, which lies in the same latitude, and in Egypt, which is somewhat farther south, may well be accomplished in Mesopotamia.

The building of the Baghdad Railway is the first step in the great work which Sir William Willcocks called the 're-creation of Chaldea.' Irrigation of the land and development of its resources will follow the establishment of good means of communication with other regions. Three million acres is the area of the land which will be available for the raising of crops when it is irrigated. The cost will be great, but it will be justified by the results. Mesopotamia will become one of the world's great granaries. The land will wake from its sleep of centuries. cities will arise, and great ports may be established on the Persian Gulf. New markets will become available for the world's manufactures, and a field of emigration will be provided for the teeming population of India.

ROSEMARY COURT.

CHAPTER V.

IT was one of Madam's customs that a wood-fire should be kept burning in the great square hall, where the sun seldom penetrated, so that the sombre oak was half-hidden in the brown shadows. Here on winter afternoons tea was always served, and here Madam had spent some of the happiest days of her placid existence. She needed no shaded lamps now, for the air was warm and the sun outside blazed down upon the sleeping gardens. In that dim atmosphere it was possible to lie back in one of those deep, carved-oak chairs and be half-hidden in the gloom. It was here that Madam St Bruyere was seated on the afternoon of the day Rupert was expected home. As a rule she hated idleness; she was not one of those old ladies who can spend hours before the fire seeing the past in the glowing coals. But to day, now that she had finished her tea and the tray had been removed, she sat very white and silent, watching the feathery ash in the fire drifting up the wide,

open chimney. And Madam was not happy.

For perhaps the first time in her life she doubted her own judgment. She had reigned here many years now, and none had ever ventured to question the wisdom of her sway. It was her boast, too, that she had never made a mistake, which perhaps accounted for the awe in which most people stood of her. But now she was not so sure. She had a perfect right to do what she liked with her own, and if she chose to sell the picture which had given Rosemary Court its name, there was none to say her nay. She had her own reasons for the sacrifice; and it had been a sacrifice, as many a restless night could tell. But hitherto, like the Centurion, she had only to say go, and they went-which was very well so long as the imperious word was said openly and in the face of all men. But this she had not done. The picture had been removed from its sanctuary in her own apartment and sent to London almost by stealth as it were. She had intended to do this thing in such a way that her right hand should not know what her left was about. And now Sir Charles St Bruyere, of all men in the world, had discovered her secret. It seemed almost incredible that the famous Sir Joshua should have found its way into his

possession. And she could not harden her heart to tell him the truth. He would not betray her, she felt sure of that. There was no sympathy between them. She detested the man and his methods-in her eyes he had degraded the House by his commercial pursuits; but neither she nor anybody else could point to anything that shadowed Charles St Bruyere's good name. He had been wild as any hawk, he had been in scores of foolish escapades, but he had never forgotten what he owed to his ancestors. It was perhaps his shrewd cynicisms and ill-concealed contempt for the domestic virtues that made Madam most dislike and fear him. And now she would have to tell him the truth, she would have to confess to her folly, the extent of which she was only just beginning to realise.

She was a very woman after all. As such the policy of procrastination appealed to her. She would postpone the evil day till after Rupert's return; and he might be back at any moment now. Perhaps if she told him everything he could find some way out of the difficulty.

When she was turning these things over in her mind the hall door opened and Rupert came in.

in.
'You have come alone after all?' Madam asked.

'No,' Rupert replied. 'I heard that you were here, and I know this is the hour when you do not care to be disturbed. Besides, Cecilia is a little overwrought with her journey and the excitement of seeing you for the first time. She said she hoped you would not mind if she rested in her own room till dinner-time. I handed her over to one of the maids.'

Madam made no comment. On the whole she did not appear to be displeased. In its way this maidenly awe of her was a compliment. She turned slowly toward Rupert. 'Is it too much to hope,' she said, 'that the child is presentable? You understand what I mean.'

'Perfectly, Madam,' Rupert said gravely. 'Cecilia is exceedingly beautiful; indeed, she is the most beautiful girl I have ever seen.'

'And so a dairymaid might be,' Madam said impartially.

And exceedingly graceful,' Rupert went on. 'No pains have been spared over her education, nor has she been allowed to forget that she is a St Bruyere. I don't think you will be disappointed, Madam. I would rather not say any more. It would be far better for you to form your own impressions of Cecilia.'

Although the flowers were adew under the golden evening sky, the curtains in the drawing-room were drawn and the shaded lamps alight. It was one of Madam's fancies to dine, even in the height of summer, by the light of the wax candles in the big silver sconces. She sat in her favourite arm-chair, a charming picture in black and white, playing with some fancy-work. She was wondering idly what this girl would be like.

She would present herself in sombre black, of course; she would naturally '----

And then all these pictures were swept away by the entrance of a tall, slender figure clad entirely in white. The dress was almost Grecian in its simplicity, yet on that slim, exquisite figure it gave the impression of a studied art which had in its very plainness a striking note of originality. Her arms and neck were bare, and about her throat was a string of pearls, the only ornament The lamps gleamed on the which she wore. piled-up masses of her hair, and seemed to make dark pools of purple in her eyes. She came forward quite easily and naturally, and without the smallest tinge of embarrassment in her manner. Her lips parted in a smile, the smile of one who is welcome everywhere, and who looks quite naturally for a welcome in return. She bent over Madam's chair and touched the smooth white forehead with her lips.

'Oh, you are perfect!' she cried. 'To think that you should be my grandmother! But then everything is perfect here. This is the house one dreams about. And you were not angry because I did not come to you at once? I was tired and had a headache. And I was a little nervous too. I see now how silly that was of me. Just as if anybody would be afraid of a dear like you!'

She dropped into a chair and smiled up at Rupert, who was standing by the fireplace, with the light of perfect understanding on her lovely face. She had come straight through the icy barriers of cold and reserve much as a butterfly might flitter between the bars of a prison. She should have come, figuratively, on her knees; she should have taken Madam's hand and kissed it with broken words of gratitude for the priceless boon of sanctuary.

From the depths of her heart Madam tried to conjure up some of that grim austerity and cold aloofness which had won her the respect and admiration of her friends. She wanted this daughter of a play-actor to feel her position, and perhaps in time earn for herself, in tears and humility, a modest niche in that proud household. But here she had come and taken smiling possession as if it had been a right, and as if she were conferring a favour upon all and sundry at Rosemary Court.

'Why are you not in black, child?' Madam

'I have never worn it,' Cecilia said simply. 'My dear mother hated it. And when she died she made me promise that I would wear no outward mourning for her. Ah, ciel, as if there were any need for it! As if I did not mourn her day and night in this poor, sad heart of mine! There was never a woman like my mother. It was nothing but good she taught me. It was a sad wrench for her when she had to send me to school, but she knew that it was all for the best. And she always knew that

some day I should come back here. And in time I shall know how to thank you.' She stopped,

and her voice trembled slightly.

Madam St Bruyere was moved, despite herself. She wanted to be hard and critical; she wanted to make this inconsequent child understand the exact position of affairs. Yet she was something of an artist-you could not live in the atmosphere of Rosemary Court without feeling the artistic influence—and the beauty, the pathos, the sweet simplicity of this girl were not lost upon Madam. She saw the blue-gray eyes raised appealingly to Rupert's dark ones, and then she saw something that made her withered heart beat a trifle faster, and her black silk mittened hands clench upon her lap. She saw, too, a certain proud defiance on Rupert's face, and just for a moment she was back again in the dim and distant past, when Godfrey St Bruyere had come riding up the path leading to her father's house to tell her that she must make up her mind. Ah, well, that was fifty odd years ago, and in those times-

'Dinner is served, Madam, if you please.'

Rupert bent and held his arm to Madam. She motioned him to go in front and escort Cecilia to the dining-room.

'I wonder,' she whispered to herself, 'what they would say if they knew what a wicked old woman I am.'

CHAPTER VI.

T seemed almost as if Rosemary Court had been awaiting the advent of Cecilia. In some strange, pleasing way she seemed to fit into a vacant place which no one had noticed before, though now the loss seemed to have been recognised all along. There was no gradual thawing of the ice which Madam imagined to have been frozen about her heart all these long Before the first dinner was finished, before the wax candles in the Cellini sconces had burned a third of their length, Cecilia was in indisputable possession of the citadel. She was so natural, so unaffected, so unconscious of her own beauty and charm, that Madam could find no fault and see no flaw in this perfect flower. She sat in her accustomed place listening and watching; she began to trace a certain likeness to her own dead, wayward child. It seemed as if the hand of time had put the clock back for twenty odd years, and taken as many years off her own life. She could see the same eyes, the same halfhumorous, half-pathetic droop of the lips, and the same red-gold glory of her hair. Madam probably would have refused to admit it, but she slept that night the happiest sleep she had known

It was the same with all of them. It was pleasing to see how one by one they came under Cecilia's sway. At first Madam waited for the friends and neighbours who, she knew, would

be sure to call, assame with curiosity to see the new-comer; but a little later it became quite the custom to take Cecilia with her when repaying these social obligations. The old scandal was not forgotten—scandals die hard in country places—and Madam was conscious of the fact. Therefore it was a source of secret pride to her to note the impression that Cecilia was making. Therewere luncheons and tennis-parties, and a little later an invitation to a fancy-dress ball at Gilray Castle, given by the duchess of that ilk. This was the one star in the social firmament to whom Madam bowed the knee.

'I am very pleased, my child,' she said; 'and I am very glad that the duchess has taken a fancy to you. If you will be guided by me in

your choice of a costume'-

'Oh, but I have already made up my mind,' Cecilia said sweetly. 'Do you know, I have the very dress for it. I was going to wear it in a poetic play, in a part which Rostand had written especially for me. A most beautiful story, Madam.'

Madam moved uneasily in her chair. Those constant allusions to the theatre troubled her. She did not realise that Cecilia's brief acquaintance with the footlights accounted for a good deal of her popularity. For here was a girl, mark you, who had actually played with distinction on the boards of the most famous theatre in Europe. Madam felt a pang at her heart.

'You're not regretting it?' she asked almost

fiercely.

'Oh no, no!' Cecilia cried. 'At first, yes. For, you see, I had my dreams. But since I have come here, no; I shall never want to go back to the stage again. After this lovely old house, so full of peace and restfulness, the stage seems so artificial. I'm going to this dance as a "summer night." I have a blue dress all cloudy and light, and I shall wear with it my mother's stage jewels. Now if you frown like that I shall think that you are offended. What does it matter so long as there's no pretence? Ah, you smile again. You shall come with me.'

'I think not,' Madam smiled. 'I have not been out in the evening for over twenty years. I cannot break my rule now even for you, Cecilia. I will find you an efficient chaperon, and you and Rupert can tell me all about it afterwards.'

Perhaps Madam St Bruyere had expected something a trifle theatrical and bizarre in Cecilia's costume; anyway, she gave a sigh of something like relief when Cecilia floated into the drawing-room before dinner in her ball-dress. She was clad in billowy waves of blue, edged here and there with black. Her wondrous hair was piled high above her head and entwined with a mass of glittering white stones, doubtless intended to represent the stars of a summer night. There were pearls about her neck, and more diamonds about her wrists. Madam smiled in approval.

There was nothing extravagant or daring here.

It was a beautiful and refined picture drawn in soft and subtle colours all blending together in one perfect harmony. As Cecilia stood there, with the deep filbert-brown of the old oak panelling behind her, she was a vision of grace and loveliness beyond compare. And two people were watching her with their souls in their eyes. Madam had seen the expression on Rupert's face; she was thinking of it now when she was alone, and mourning for what might have been.

'Let them enjoy themselves while they may!' But I shall never live to see she murmured. that dream fulfilled. What a ruin I have made of everything! If I had only known; if I had only gone to my child in the hour of her need! But these are vain regrets. To think of

the things one might have done!'

All heedless of what they had left behind them, Cecilia and Rupert had given themselves over to the enjoyment of the moment. first time that Cecilia had been out, yet there was about her no trace of shyness. To her it was a dream of pure delight. From the first moment she entered the banqueting-hall where the dance was in progress she triumphed. Yet with it all she seemed to be utterly unconscious of success. She danced in an ecstasy of enjoyment. She was childishly pleased to find her programme full, for on this point she had expressed her doubts to Rupert as they drove along.

He laughed quietly. 'You need not fear,' he

'My doubt is how many dances you are

likely to have for me.'

And here she was under the shaded lights, surrounded by an atmosphere of roses, under the approving eyes of the duchess herself. There came a moment later on when she found herself She was conscious that a late-comer was regarding her through a gold-rimmed eyeglass with critical approval. In a man younger or less distinguished-looking the criticism would have been impertinent. Then the tall man in the oldfashioned evening-dress and embroidered shirtfront came and sat beside her.

'My age must be my excuse,' he said. I have only just arrived. My dear child, I am a sort of relation of yours, a kind of uncle on the other side of the House. In other words, I am Sir Charles St Bruyere. And I want you to forgive me for not having as yet called to pay my respects to you.'

'I have heard Madam mention your name,'

Cecilia replied. 'You are not very good friends with her, Sir Charles ?'

Sir Charles chuckled. He sat there appraising Cecilia as if she had been some rare and valuable picture. And she had his entire approval; there was not one flaw in this exquisite painting.

'I hear you are getting on all right with our dear Marcia,' he laughed. 'But don't you remember me? When you were a tiny tot I used to come over to Paris and see your mother sometimes. Ah, well, the memory of youth is short. I hear that Madam is proud of your success; she would have been prouder still had she been here this evening. That dress of yours is a positive inspiration. I am an old man, and therefore privileged to say these things. whence came all those wonderful jewels?

Cecilia laughed innocently enough. 'I am afraid they are meant to deceive, 'she said. 'For you know, Sir Charles, that stage queens always wear stage diamonds. These belonged to my dear mother. She wore them the last time she appeared in Paris. They are no more than good paste at the best; but I have never liked to get rid of them just because they belonged to my mother. I like to think of her the last time I saw her wearing them; that beautiful mother of mine whom everybody loved and respected.'

'You will follow her example some day, I

suppose?'

Oh no. Since I have been here I have learned that there is a better life than that. a little time Rosemary Court has taught me many lessons. So I shall pack my paste diamonds away in their cotton-wool, and only bring them out on great occasions such as this.

'Quite right,' Sir Charles said approvingly. 'Only, don't part with them, because you never know when the wolf is coming to the door, and in that unhappy event even stage diamonds are useful, especially when they happen to be the property of a charming and distinguished actress who has made a reputation in two continents. If ever you do want to part with them, bring them to me, my dear. Ah!

Sir Charles sighed resignedly as Rupert came hurriedly forward, his face white and anxious.

'We must get back at once, Cecilia,' Rupert 'I have had a most alarming message from home. Madam has had some sort of paralytic seizure. A motor is waiting for us outside.'

(Continued on page 58.)

THE 'SCREW' RAILWAY.

By W. O. HORSNAILL, A.M.I.Mech.E., A.M.LE.E.

ONE might reasonably suppose that underground travelling has become so perfect in the form of our latest tube-railways that no great improvements would be possible in the future; yet a new method has recently been invented

and tried, which, if practicable on a large scale, will take us from point to point more quickly and comfortably than we are at present accustomed to travel.

The new system is similar to a moving plat-

form, in that the passengers step on and off whilst the carriages are in motion, and a train is always slowly passing each platform. On the other hand, the carriages, which are close together in the stations, separate and run at a high speed between stations, so that they move from station to station much more quickly than a continuous platform limited to a speed at which passengers can board or alight.

The subways will be only just below the surface—hence the delays owing to lifts and stairs will be avoided; and, the stations being only a quarter of a mile apart, very little walking will be entailed to reach any particular spot above-

ground near the line of route.

The carriages will not be connected to each other, although they will pass through the stations close together, and only six or eight passengers will be accommodated in each. may imagine, therefore, a row of small carriages moving through each station continuously at about three miles an hour, whilst the passengers step out on to the first half of the platform and enter from the last half. At the same time, other carriages will keep coming up and joining on behind, their speed between stations being about twenty-five miles an hour; but they are slowed down before reaching the platforms. Similarly, the carriages in front will detach themselves one by one as they get up speed again; hence they will be a long way apart in passing through the tunnels.

Of course safety devices will be provided to prevent any possibility of passengers being squeezed or otherwise hurt, and these appliances have already been invented to complete the

system.

The carriages are made to run exactly as described by an enormous screw which revolves in a small subway between the rails. This screw is in the form of a tube about two feet in diameter, and has a spiral rail attached to it, the distance between the spirals being varied according to the speed required. Thus at the stations the turns of the spiral rail are only one foot apart, whilst in the tunnels they widen out to eight feet. Fixed under each carriage are two little rollers which roll on the spiral rail;

hence for every revolution of the screw the carriages are moved forward one foot at the platforms and eight feet in the tunnels. With this arrangement it is only necessary to revolve the screw the correct number of turns a minute to run the carriages at three miles an hour through the stations, when they will speed up to eight times as fast in the tunnels, where the turns of the spiral are eight times as far apart.

The screw is revolved by an electric motor at each station, and it is in one length between stations, supported by rollers. At the ends of each length the spiral rail is broken for a few feet; but this does not matter, as each carriage is pushed over the gap by the one following.

There are, of course, two lines of rails and two screws, running opposite ways; whilst at each terminus there is an ingenious contrivance which automatically guides each carriage round a loop on to the other line ready for its return

journey.

In between the rails is a wide slot through which the arm carrying the rollers passes to the screw, and this slot is used to guide the carriages and keep them straight by means of little wheels having vertical spindles fixed to the underside of each carriage. The latter being guided in this way, there is no need for flanges on the wheels, which are therefore flat and run upon flat rails; and as such small carriages are very light in weight, it will be practicable to make the rails of rubber or some soft material which wili be silent. In any case, very little noise will be made compared to the ordinary train, owing to the lightness of the vehicles and their distance apart in the tunnels. Moreover, it will be impossible for carriages to collide or to escape their guide-wheels and come off the line; and as the speed and position of each vehicle is exactly controlled by the screw, no drivers, brakes, or signals will be needed; whilst conductors will be replaced by automatic contrivances for controlling the doors.

The first cost and working expenses have been very carefully gone into by the inventors, who are confident that the figures will compare favourably with those for the ordinary tubes, whilst a larger number of passengers can be handled.

HIS FATHER'S LEGACY.

By W. H. WILLIAMSON, Author of The Traitor's Wife, A Family of Influence, The Stolen Bride, &c.

WHEN Thomas Higgins died people shook their heads; not because death came to Thomas Higgins, as it will come to all, but because of Reginald Higgins. Thomas had made his way from nothing to be the possessor of halfa-million of money. Reginald, his only child, had been educated as the heir of wealth. Mrs Higgins had died six years ago, and Mr Higgins lived in The Towers at Stimslow, about a dozen

miles from Manchester, amidst costly pictures, costly furniture, and costly gardens—everything costly and little satisfying; for the only child of the household, the son to inherit all the wealth Thomas Higgins had accumulated, was a wastrel.

As Thomas amassed money he lavished it on his son. Reginald went to Oxford with an allowance of five hundred a year, and came back loaded with debt and bare of scholastic attainment. And of course cotton did not attract him. He could not bear the sight of a cotton-mill. Spindles and looms-ugh! He wouldn't mind motoring—that was all right! So a rich and indulgent father set him up with ten thousand

pounds in a motor business.

Reginald lived in London. You must have relaxations even in business, and what was there to do in Stimslow and Manchester? London for Reginald! He said Leicester Square, Piccadilly Circus, and the Strand were pictured on his heart. He married while he was in London. His wife was in the ballet at the 'Empire,' and helped him to run through the ten thousand pounds in the business at the rate of five hundred a month. When it was spent she died, her pirouetting over.

Reginald crawled home, and his father forgave. But Mr Higgins could not keep Reginald in Stimslow and Manchester, so he made him an allowance of five hundred pounds a year, and Reginald lived in his beloved London.

Perhaps it was natural that people should

shake their heads.

Reginald walked through The Towers with a tickling sensation. This was his! That was his thought. All these things belonged to himpictures, ornaments, carpets, furniture, silver, bricks and mortar, land, motors, horses-his! And half-a-million into the bargain at the very least.

He felt grateful to his father for having piled up this huge fortune for him. Twenty thousand pounds a year at least—after five hundred! Wouldn't he have a time! The guv'nor must have been smart, all the same, to pile up all that.

There were a few relatives and many friends at the funeral, and when it was over Reginald felt magnificent as he stood alone in the breakfast-room. What should he do with The Towers -sell it, or keep it?

Mr Green, the solicitor, was shown in.

- 'Come in, Mr Green,' said Reginald. 'Have a cigarette?
 - 'No, thank you.'

'Cigar ?'

'I think I would rather get through the business first, if you don't mind, Mr Reg-Mr Higgins.'

Just as you like. Business, eh?'

'The will.'

'Of course. I hope the guv'nor didn't chuck away money on those beastly charities and rot of that kind. I don't want to bother with details, if you don't mind. What there is to pay out you can pay, can't you? You'll act for me as you did for the guv'nor, eh?'

'Thank you. I shall be glad to do all I can for you. But it is a curious will, Mr Higgins.'

'Oh, I suppose I'm all right?' A sudden

shock seized him. Suppose his father had not left him all!

'Well, suppose I read you what your father said. After leaving sundry legacies to relatives and servants, which will amount, I think, to something like fifty thousand pounds, the will reads: "And to my son, Reginald Higgins, I give and bequeath the residue of my estate, on condition that he obtains from the Head of the Monastery of Charkhlik the choicest portion of my wealth. I desire my son to make a journey to this monastery, and there claim his right. For this purpose the sum of one thousand pounds is to be given him. He must make the journey viâ Kashgar and Karaul, and arrive at the monastery within twelve calendar months of the date of my funeral. I desire that his companion shall be Harold Bright, who has journeyed over the road, and that there shall be no other companions save servants. I give and bequeath to the said Harold Bright one thousand pounds if the journey is begun, and an additional sum of ten thousand pounds if he and my son reach the Monastery of Charkhlik. If my son does not reach the aforesaid monastery within the time fixed above, then I desire that the residue of my estate shall be equally divided between "-Here follows a long list of charities,' added Mr

Reginald had thrown his cigarette down. 'What!' he stammered; 'was the guv'nor mad?'

'Quite sane, Mr Higgins.'

'But is that a joke, or what?'

'It is no joke.'

'Do you mean—but it's—— You know, I don't understand the blighted rubbish at all! Isn't this all mine?'

'On conditions.'

'Conditions! That I go to some miserable monastery! Where is the wretched hole?'

'On the frontier of Tibet.'

'The frontier of-- Great Scott!' Reginald looked furious. He felt angry and impotent, which adds fuel to anger. 'Can't I send somebody? Can't Harold Bright go alone?'

'Is this any of your doing?' he asked savagely, hoping for a victim on whom to pour his wrath. Mr Green shook his head. 'The idea was

entirely your father's.'

'But what the devil have I to go to a blighted monastery for? Have I to become a Buddhist,

or a fire-worshipper, or what?'

'Nothing of that, Mr Higgins. You have simply to go and claim from the Head of the Monastery at Charkhlik your fortune, and I believe you would not be satisfied with what is left if you did not get the portion there. If you do not go to Charkhlik you get nothing.'

'Nothing! I've got The Towers, surely?' 'Nothing. All is residue after the specific

legacies.'

'Well, I'm jiggered! Whatever— You

know I can't take it in. Can't I touch a

'A thousand pounds if you will go.'

'Well, I'm' Reginald sank into a chair, and it took him quite a considerable time to realise the kind of will his father had left. He swore considerably. He made Mr Green read the will again, explain it, discuss it, and even then did not thoroughly accept it.

Mr Green suggested that he should come again in the morning, bringing Mr Bright with him, and then they could talk over the matter calmly.

Reginald looked most unhappy.

He realised what it meant in the morning.

Harold Bright was a man about three years older than Reginald, and had travelled for Mr Higgins on business concerning cotton, curios, and other things, acting when in Manchester as Mr Higgins's secretary. He was a healthy, clean-shaven, clean-bodied man, and Reginald liked him.

Bright knew the terms of the will, and re-

explained them.

'And it really means,' said Reginald, 'that you and I and a pack of dromedaries are to go tramping to that twopenny monastery; otherwise '-

'Otherwise!' Harold smiled.

Reginald swore copiously, and wished to know how he could get to the blighted place. Could you motor? Suppose you'd get broken down every other mile! And he'd be months out of town just when the new piece was coming on at the 'Satiety,' with Kitty Mewler in it. Impossible!

The others let him talk. It had to be. So

had the journey.

Reginald refused to budge for a week, but then he saw dallying was no good. To a monastery on the confines of Tibet he had to go, or else he got no fortune. He gave in. Of course Harold had all the arrangements to make; and a fortnight after the funeral of Thomas Higgins, Harold and Reginald were on the road to Tibet.

Reginald was somewhat interested in the beginning of the journey; but he wearied quickly of the train. Harold refused to stop. Reginald pleaded for a 'night or two' in Paris, and almost screamed for Vienna; but Harold said 'Charkhlik,' and pushed on. Reginald wished to know if he was to be considered as a 'bally commercial, or what?'

Harold said, 'If you go straight to Charkhlik you will make nearly half-a-million pounds, so you can consider yourself a "bally commercial" or not as you please; but you are not going to riot or get drunk while you are with me on this journey.

Reginald cursed Harold, cursed his father, cursed railways, Russians, monasteries, and in particular the Monastery of Charkhlik on the frontier of Tibet.

Boredom was mild language to describe

Reginald's attitude when he reached the Caspian and then journeyed through Turkestan. sighed for drinks; he sighed for Leicester Square and the 'Satiety,' for little cafes, little suppers, little chorus-girls or principals—for all the fleshpots of London. 'To think of me,' he said, 'in this God-forsaken country!' He pictured himself as a kind of oasis moving through the land.

The journey to Kashgar tried him terribly. He said he would go mad. He railed against the will in most fiery terms. Whatever possessed his father? Was he dotty? Did he know this place? It was surely handed over to the devil to finish, and he'd scamped it in his devilish way. He would go back-chuck the money-

it wasn't worth it.

But the little caravan moved slowly on to Kashgar. After Kashgar troubles began. The sun was terribly hot; gnats abounded; movement Reginald wondered if the whole was slow. thing were a trick, a conspiracy on the part of Green and Harold to drive him mad, or kill him, and get the fortune.

Harold appeased him by detailing the destination of the residue. The list of charities made

Reginald irreverently mad.

But at the end of a month he merely droned his discontent. Harold seemed a very nice sort of chap. He read portions of David Copperfield and Shakespeare in the evenings, and Reginald

began to let his fury abate.

Then the travel became diverse. The country was gigantic. If you felt bored in London you could go into a club or a 'pub,' and say something to somebody; but here, amidst the vast, untenanted plain—well, what was really the good of being bored? You had to endure it.

The funeral was on July 19th. In December Reginald was in winter quarters at Karaul. They had travelled over frozen streams, by deserted plains, through poor villages, near nomads on the march.

But now came serious travelling. There were Harold and Reginald, two natives, eight camels, and two horses.

Reginald was beginning to forget Leicester Square. Truly this land was in nowise like it. Bare of houses, bare of people, bare of vegetation -sand, sand, sand.

As Reginald saw into what they were moving he said, 'Oh!'

- 'What is it?' asked Harold.
- 'I ask, what is it?'
- 'Sand—just sand.

Reginald had nothing more to say.

The caravan marched in single file, treading down the sand, so that the last two horses, on which Reginald and Harold rode, marched on comparatively firm ground. Great mountains of sand rose up, and the travellers marched between them. When they camped they dug for water, and found it salt.

They came to level plains—plains of sand.

'Margate without the jetty this,' said Reginald. Harold smiled. It was the pleasantest remark Reginald had made.

Night came, and the temperature dropped to zero.

Reginald nestled in his furs, and said to Harold in the morning, 'This would give the Serpentine beans, wouldn't it?'

'It will give us beans if we don't take care,' said Harold, pleased that Reginald took it so well.

They marched on till they came to great mountains, and the guides led them through Reginald and Harold had to climb; riding horses was impossible. This was no A fall meant serious injury, if child's-play. one escaped death.

'Worse than climbin' 'buses this!' said Reginald.

The guides stopped with blank faces; they had missed the path, and were in a cul-de-sac.

'But we must go on,' said Reginald.
'We must turn back,' said Harold.
'After comin' so far?'

'We must find the road.'

They turned back, creeping along their old trail, silent, disheartened, and anxious. They crept down the mountain-sides, and the guides stopped and discussed and went on.

A sandstorm arose. They turned up their coat-collars, bent their heads, and slowly went on. But the sand rattled against them pitilessly. It was in their eyes, in their ears, in their Reginald was spitting at every stride. mouths.

'I shall be blind soon if this goes on,' he said,

but not petulantly.

Harold decided to camp till the storm passed. But the food was sandy, and when they lay down they lay down on sand.

Reginald elept very well considering. But it was the next day that tried them. cold dropped in the night to minus fifteen degrees.

The guides found the right path, but made another discovery: fuel was short. What they had taken for fuel turned out to be something

They were over sixteen thousand feet above sea-level.

Harold said, 'This is different from Regent Street, Reg.'

'Yes. Just think of me in this place!'

'And there are risks.'

'What of?'

'Starvation.'

'We must chance that.'

'You don't mind?'

'Oh, what's the good?' said Reginald, smiling.

'Good of what?

'Of swearing.'

'Not much,' said Harold with a grin.

The guides were on in front. The light on the snow-capped mountains was wonderful in its wealth and lavishness.

'Isn't that beautiful?' said Harold, pointing to the mountain snow, rose-coloured tapering to purple, and near them sparkling like crystal.

Reginald seemed also to be impressed by the picture. This panorama was theirs—theirs only. It was not like the scenes in Switzerland, visited by parties daily, almost hourly, made positively vulgar by the crowd. Here there was nobody. Not a living soul passed this way once a year perhaps. It was majestic! This beautiful snow, mantling the mountains, shedding itself profusely and wantonly on all the peaks for miles and miles and miles, was there for them only. When snow lay on a mountain it seemed as if it must A pretty woman veiled or shut up was not more incongruous than a snow-covered peak without a human being to admire. And down from this scene of beauty the eye could travel to the plain beyond. A brown patch seemed to come creeping to the snow, and the snow had retreated timidly, clustering with perfect security and pride only on the heights.

'Nobody gets the spirit of these places when

they paint 'em,' said Reginald.

Harold looked. 'No. Very few.'

'Just imagine shouting here!

'Yes; and think of shouting in Leicester Square.

Bother Leicester Square!' said Reginald with

Harold seemed content to agree.

They risked part of their precious fuel in making a fire that night, because a warm meal was essential.

Reginald watched the sun set. 'I can scarcely stand it,' he said.

Harold nodded.

'Look at the colours!'

'Yes.'

'Every shade. Oh!'

'What?'

'Nothing. So beautiful!'

After a pause Reginald said, 'Never saw anything like it-never! I've been to Switzerland, Saw all the stuff they chuck at you. Peuh! suppose it was the company. Look at that red; it's simply gorgeous.'

'Heavenly.'

'Yes, heavenly.'

'And just for us!'

'Just for us. Here it's the genuine thing, too. In Switzerland—I don't know—seems commoner. Well, you don't go through Switzerland like this, do you?'

No.

They reached the plain the next day, and travelled over the hard, dry ground, having the luck to find some dead branches and vegetation, which gave them a fire.

But the dry earth yielded no water. This became a serious thing. Reginald prospected, and struck the spoor of some wild animals. He

was delighted at his discovery, and the spring was a joy to them all.

The march grew monotonous again on the plains, for the sandy wastes were ever before them. But Reginald found something enticing

in the journey, and never complained.

They went through passes between the mountains; they crossed rivers, and were nearly drowned. They thought more than once they would never live to see another day, for they were menaced by flood and starvation in varying degrees; but at last they came to their haven.

It was in March of the following year that

Harold, putting his hand to his eyes, said, 'There

it is.'

'What?'

'The Monastery of Charkhlik.'

'That!'

'Yes.'

Reginald nodded. 'What an eight months we have had!

'Do you regret them?'

'No.

'Good! Better than Leicester Square?'

'Better than what?'

'Leicester Square.' Harold laughed.

'Confound Leicester Square!' said Reginald. Harold said, 'Your father would have been

pleased to hear you say that.'

'Yes; wish he could hear me, dear old chap! I used to say Leicester Square was engraved on my heart; but after this I wouldn't have it scribbled on the sole of my boot!'

Harold laughed. 'Wonderful! Wonderful!'

'What is?'

'Here we are.'

They arrived at the monastery, and were met by the lama, who knew Harold, for they had met in Tibet when Harold entered it from the Indian side. When Reginald was introduced, the lama, a kindly man, looked at him searchingly. It seemed as if he would read Reginald's Then he left them, saying he would return in a moment, and came back with a sealed letter, which he gave to Harold.

'Mine?' asked Reginald, pointing to himself.

The lama nodded.

It was addressed, 'To My Son.

'The guv'nor's writing,' said Reginald, and broke the seal. This was the letter:

'MY DEAR BOY,-Money in the hands of a fool is as bad as a loaded weapon. You have disappointed me. Perhaps it was my fault, perhaps the fault of us both; but, in any case, I will not help my boy to be a mere wastrel. If I leave you a fortune at the present moment you will ruin not only yourself, but many other people into the bargain. Spongers will come to you, rogues will come to you, the world, the flesh, and the devil will come to you so long as you have any money. Just so long, which would not be very long. And with the money gone, you ruined body and soul, what use is that experiment in life? Besides, it has been tried too often. I would rather leave you penniless. A person without money works, and he who works may always look the world in the face without shame. It does not pain me to think of you as a clerk at two pounds a week, as a mechanic, as a chauffeur—as anybody doing a decent day's work for the purpose of living as decently as one can. If you have ambition and determination and ability you will not always occupy a humble position.

'But I will not think of you as a wastrel. Only the meritorious deserve power, and money is power in these days. Hence my will. I hope that a journey through wild and difficult regions will do something for you. I trust and pray it will. To my old friend Para Bingh I have entrusted two things—a letter and a phial. He shall judge. Harold Bright I can trust implicitly, and he will let Para Bingh know by a glance how you have acquitted yourself in your journey. If well, you will have the letter; if you sigh still for inanities and folly, thenmay God forgive me; but, better for the world -the phial.

'I write this in my deep love for you. You are all I have to live for that is mine. I have seen you grow from a golden-haired baby that crept into the hearts of your mother and me, as babies do creep into parents' hearts; and I have watched you grow to manhood with a grief you cannot at present understand. And now I leave it all on the knees of the gods. How will you turn out? Will it be victory? Will the desert have done what I hope? Or- God bless you, Reginald, my dear, dear boy! If you receive this letter you will have won, and I, as I write, know I am speaking to a new Reginald,

Reginald had tears in his eyes. He bit his lip, but managed to murmur, 'What was in the phial?'

the son I wished for.

'Poison,' said Harold, and he nodded toward Para Bingh, who was now pouring it on the fire in the stove.

'MORE BLESSED.'

I WANT to do thee good! In the old days I was content—as loving children are—
To watch and wait thy coming from afar;
To haste to meet thee on thy homeward ways, To rest beneath the sunshine of thy gaze, And feel in truth that naught on earth could max

My perfect joy. Nor sun nor moon nor star Were lacking if I lived beneath its rays!

But now I crave a wider, deeper bliss.

I long to give, as God's true givers should,
My very all; to press love's loyal kiss
Upon thy feet. Ay, my heart craves but this:
To serve thee humbly, as a poor slave would
Who loves his lord. I want to do thee good!

KATE MELLERSH.

THE HEART OF THINGS.

By HENRY LEACH.

LONDON, Yesterday.

Robert Scott, whose body is to lie undisturbed in those wild Antarctic wastes, just as it was laid there when the blizzard raged. It is for its effect upon other lives that the value of any one life is to be judged; and by such a reckoning as this it is certain that the value of Scott's is enormous, though the strong part of it began less than fifteen years ago, and closed before the man was forty-four. He invented little or nothing. He carried out no great public works. He made no fine speeches, and confined himself to writing such books as were the plainest and simplest records of work. He made no great flights in aeroplanes, built no bridges, commanded no armies or ships in time of war. He made no millions of money; indeed he did not. This man did none of those things which usually get men looked upon as great and earn adulation for them. His was a simpler, grander greatness, that will endure and shine the better when ages have gone by. He only, with some others, trod a weary, toilsome, painful way to the extreme south of the world; and when he reached the polar summit about the plains of snow he found that he was not the first to be there, and made then a more weary, more painful march backward as far as he could go. Some good scientific work was done in the meantime; but it is not that which

THERE need be no mourning now for Captain

The reason why Scott must be a vast influence now and an influence for ages hence is because of the supreme manliness of character that he exhibited throughout his life and in the moments of his lonely death, because of the simply towering nobility and beauty of his character, and the sweetness of it—for that is one of its most splendid features. In the

counts so much in the reckoning of the value of

Scott's Last Expedition, as is the title of the two books, one of them written by the hero

himself, that have just been given to the world

by Smith, Elder, & Co., as the final record of the grand achievement. What does count is

the manner of life and death, the thoughts and the deeds, the greatness and grandeur of the

soul, the magnificent inspiration that they must

yield to every man whose own soul is still alive.

greatest men there is always this element of sweetness, of softness, of gentleness, the remains of the nature of the little child who, with all his innocence and trust in good, has not been lost in the bitterness of the world. When the nature of a man of fame is wanting in any trace of this gentleness, the man misses the best point of greatness, the humility of it. The soul of Scott was full of it. In the majestic simplicity and truth of his character one feels that there is something at which Nature herself might step back to admire in pride for her own perfection Those who were his friends knew of this splendour of him, and rejoiced in it; the whole world may gain some knowledge of it as it is, without intention, revealed in these two books which I have mentioned. They are the story of the brave fight and the noble death, and they are an epic of British courage, a poem of the splendour of man. And there is the gentleness, the simplicity, the human sweetness in it all that will appeal to every reader as scarcely any other book has done or ever will. One would be sorry for him who could rise from the reading of these volumes without feeling the better for it, somewhat humiliated, much strengthened in his determination to do the better thing, to live the stronger, sweeter, more unselfish life.

Of the man and his work, and even of the end of it when the first brief news came up from the South, there has been something written in these pages before; but there is good reason, even a personal one to the readers of this Journal, for something more to be said. I had the honour, privilege, and enjoyment of Scott's friendship and confidence for many During his last days in London I saw much of him, and one morning there came a note asking me to come round and see him to say good-bye. In a long conversation he told me for the last time of many of the hopes and beliefs that he held about the great work that lay before him as he rarely, if ever, had expressed them before. Some things that he said were never to be written or spoken about afterwards. But he told me that he felt that he would reach the Pole, and almost suggested that he would not care to return home if he did not. And he

No. 161.-Vol. IV.

mentioned some things that might be done if news of his expedition were not received when it was expected, and fears were felt for it. then it was 'Good-bye. And you will come to meet me when I come home again?' his association with the readers of this Journal there is this to be said, that he was one of them, and the last letter that he wrote to me when he was even then away down South, and on the very eve of cutting himself off from inhabited land, had reference to something that was printed in it about his expedition, and it was probably the last reference he ever made to anything of the kind, for he was shy and reserved in such matters. He said: 'I have just seen an article in Chambers's Journal concerning the expedition, and write to thank you for it. . . . I have often thought of our parting on the steps outside my office, and of the ripening of our friendship which preceded it. I am not ardent in desiring popular appreciation, but was touched by the kindly, generous feeling that underlay your article. . . . I am glad at such a time as this to be able to write good reports to my friends. The expedition flourishes. All preparations have worked out with extraordinary accuracy. We have re-examined, re-counted, re-sorted, restored everything during our stay here, and have found all in good order. More satisfactory still is the spirit of enthusiasm which exists amongst the members of the expedition. I have never seen it equalled. We ought to do good work with such material, and we start with high hopes. Good-bye.—Yours very sincerely, R. Scott.'

* * *

Let us glance, then, at a few of the passages that he wrote in the deathless diary that was found under his shoulders eight months after he had fallen asleep in the Antarctic snow. It is the record of the work that he went out to do, and the story is told simply, beautifully, as surely no story of the kind was ever told before, right up to the moment when the dying hand could write no more. The complete work is in two volumes, the first one being the journals of Scott himself, and the second the reports of the journeys and the scientific work undertaken by Dr E. A. Wilson (who died with him) and the surviving members of the expedition. Of the doctor it is written in the commander's diary: 'Words must always fail me when I talk of Bill Wilson. I believe he really is the finest character I ever met; the closer one gets to him the more there is to admire. Every quality is so solid and dependable; cannot you imagine how that counts down here? Whatever the matter, one knows Bill will be sound, shrewdly practical, intensely loyal, and quite unselfish. Add to this a wider know-ledge of persons and things than is at first guessable, a quiet vein of humour, and really consummate tact, and you have some idea of his value. I think he is the most popular member of the party, and that is saying much.' Wilson's striving and his work were splendid, and his sufferings at the end were keen; but naturally it is Scott's work and words that claim chief attention now.

* * *

The early work of the expedition, and all the commander's many intensely interesting observations upon it, and the life that was so cheerfully, courageously led by him and his party during the long, dark Antarctic winter, must be passed over, though nearly everything in the world and something beyond it seem to have been thought about and discussed as they only could be by men who felt themselves to be going to grips with the infinite and the eternal. The pathos of their situation is deeply impressive. One day Scott seems for a moment to begin to wonder whether he is getting rather too far on in life for great work of this kind. With his grand optimism he was proof against a sentiment once expressed by Anatole France that 'the twilight of youth is the most melancholy hour of life. It needs either courage or stupidity to pass through it without becoming rather morose.' But he could appreciate it. He wrote: 'We both conclude that it is the younger people who have the worst time. . . . Wilson (thirty-nine) says he never felt cold less than he does now; I suppose that between thirty and forty is the best all-round age. Bowers is a wonder, of He is twenty-nine. When past the forties it is encouraging to remember that Peary was fifty-two!' Scott himself was forty-three. Above everything he was always proud that he was a sailor, and he liked to go on such great work as this in the way of a sailor. He told me once that while modern inventions and resources must be utilised to the full, he wished, if he could go near to the Pole, to go there in something like the simple manner of the great explorers of old, depending so much, like the handy sailor-man, on their own fine strength and grand resource. So in his diary, on the eve of his departure on the great lonely journey, he writes: 'It is not often I have a sentimental attachment for articles of clothing; but I must confess an affection for my veteran uniform overcoat, inspired by its persistent utility. find that it is twenty-three years of age, and can testify to its strenuous existence. It has been spared neither rain, wind, nor salt sea-spray, tropic heat nor Arctic cold; it has outlived many sets of buttons, from their glittering gilded youth to green old age, and it supports its fourstripe shoulder-straps as gaily as the single lace ring of the early days which proclaimed it the possession of a humble sub-lieutenant. Withal it is still a very long way from the fate of the "one-horse shay." He writes again: 'My afternoon's walk has become a great pleasure; everything is beautiful in this half-light, and the

northern sky becomes redder as the light wanes.' At the end of this chapter there are a number of quotations from writers that have attracted him, and one is this from Stevenson: 'Every durable bond between human beings is founded in or heightened by some element of competition.' On the last day of October 1911, when all was ready for the plunge, he wrote: 'We shall all get off to-morrow. . . . The future is in the lap of the gods; I can think of nothing left undone to deserve success.'

* * *

The chosen party went away. They moved on with their animals and sledges well and cheerily, hopefully. Little by little, surely, persistently, the inevitable hardships came and were surmounted. The weather troubles were most exceptionally bad, even for the high Antarctic. After four days' delay he wrote on 5th December, at noon: 'We awoke this morning to a raging, howling blizzard. . . . The ponies -head, tail, legs, and all parts not protected by their rugs-are covered with ice; the animals are standing deep in snow, the sledges are almost covered, and huge drifts above the tents. have had breakfast, rebuilt the walls, and are now again in our bags. One cannot see the next tent, let alone the land. What on earth does such weather mean at this time of year? It is more than our share of ill-fortune, I think; but the luck may turn yet. I doubt if any party could travel in such weather, even with the wind; certainly no one could travel against it. Is there some widespread atmospheric disturbance which will be felt everywhere in this region as a bad season, or are we merely the victims of exceptional local conditions? If the latter, there is food for thought in picturing our small party struggling against adversity in one place, whilst others go smilingly forward in the sunshine. How great may be the element of luck! No foresight, no procedure could have prepared us for this state of affairs. Had we been ten times as experienced or certain of our aim we should not have expected such rebuffs.' And the downright bad luck that dogged the enterprise, and one remark of Scott's in this quotation, lead a reader to turn back a few pages to look again at a letter of his dated two months before, which is quoted in the diary, wherein he refers to Amundsen, who was then on his way polewards, and who got to the goal before him: 'I don't know what to think of Amundsen's chances. If he gets to the Pole it must be before we do, as he is bound to travel fast with dogs, and pretty certain to start early. On this account I decided at a very early date to act exactly as I should have done had he not existed. Any attempt to race must have wrecked my plan; besides which, it doesn't appear the sort of thing one is out for. Possibly you will have heard something before this reaches you. Oh, and there are all sorts of possibilities! In any case you can rely on my not doing or saying anything foolish; only I'm afraid you must be prepared for the chance of finding our venture much belittled. After all, it is the work that counts, not the applause that follows.'

* * *

Through the first three weeks of December the journey on-pulling the sledges, for the dogs had gone-was successfully made against the uttermost trials. The Beardmore glacier was crossed, and on the 22nd day of the month the party that started out was reduced to eight for 'the summit journey to the Pole,' the others regretfully returning. 'This, the third stage of our journey, is opening with good promise. We made our depôt this morning, then said an affecting farewell to the returning party, who have taken things very well, dear good fellows as they are.' The next night: 'To me for the first time our goal seems really in sight. We can pull our loads, and pull them much faster and farther than I expected in my most hopeful moments. I only pray for a fair share of good weather. There is a cold wind now, as expected; but with good clothes and well fed as we are, we can stick a lot worse than we are getting. I trust this may prove the turning-point in our fortunes, for which we have waited so patiently.' This was how Scott spent his last Christmas. In the morning they were hard on the march, with sundry adventures among crevasses. At night, in his tent, he wrote: 'I am so replete that I can scarcely write. After sundry luxuries, such as chocolate and raisins at lunch, we started off well, but soon got amongst crevasses, huge snowfields, roadways running almost in our direction, and across hidden cracks, into which we frequently fell. Passing for two miles or so along between two roadways, we came on a huge pit with raised sides. Is this a submerged mountain-peak or a swirl in the stream? Getting clear of crevasses and on a slightly down-grade, we came along at a swinging pace—splendid. I marched on till nearly 7.30, when we had covered fifteen miles (geo.), seventeen and a quarter (stat.). I knew that supper was to be a "tightener," and indeed it has been-so much that I must leave description till the morning.' That Christmas supper consisted of four courses -the first, pemmican, full whack, with slices of horse meat flavoured with onion and curry powder, and thickened with biscuit; then an arrowroot, cocoa, and biscuit hoosh, sweetened; then a plum-pudding; then cocoa with raisins; and finally a dessert of caramels and ginger. After the feast it was difficult to move. and I couldn't finish our share of plum-pudding. We have all slept splendidly, and feel thoroughly warm, such is the effect of full feeding.'

On 29th December Scott describes the marches as terribly monotonous; and on 3rd January the advancing party was still further reduced to five,

three men being then sent back. The diary of 11th January says: 'I never had such pulling; all the time the sledge rasps and creaks. have covered six miles, but at fearful cost to ourselves. . . About seventy-four miles from the Pole. Can we keep this up for seven days?' Yes, they kept it up. 15th January: 'It is wonderful to think that two long marches would land us at the Pole.' Alas! for all that followed, though they landed at the Pole.

On Tuesday, 16th January, when the party had made their sixty-eighth camp from the time of leaving their base, and when they were at a height of nine thousand seven hundred and sixty feet, and the temperature was minus twenty-three degrees, the following melancholy facts had to be stated in the log of this heroic journey: 'The worst has happened, or nearly the worst. marched well in the morning, and covered seven and a half miles. Noon sight showed us in lat. 89° 42' S., and we started off in high spirits in the afternoon, feeling that to-morrow would see us at our destination. About the second hour of the march Bowers' sharp eyes detected what he thought was a cairn; he was uneasy about it, but argued that it must be a sastrugus. Half-an-hour later he detected a black speck ahead. Soon we knew that this could not be a natural snow feature. We marched on, and found that it was a black flag tied to a sledge-bearer; near by the remains of a camp; sledge-tracks and ski-tracks going and coming, and the clear trace of dogs' paws-many dogs. This told us the The Norwegians have forestalled whole story. us, and are first at the Pole. It is a terrible disappointment, and I am very sorry for my loyal companions. Many thoughts come, and much discussion have we had. To-morrow we must march on to the Pole, and then hasten home with all the speed we can compass. All the day-dreams must go; it will be a wearisome We are descending in altitude—certainly also the Norwegians found an easy way up.' The next day they got there. 'We started at 7.30, none of us having slept much after the shock of our discovery. . . . We followed the Norwegian sledge-tracks for some way; as far as we make out there are only two men. In about three miles we passed two small cairns. Then the weather overcast, and the tracks being increasingly drifted up and obviously going too far to the west, we decided to make straight for the Pole according to our calculations. . . . The wind is blowing hard, $T. - 21^{\circ}$, and there is that curious damp, cold feeling in the air which chills one to the bone in no time. We have been descending again, I think; but there looks to be a rise ahead; otherwise there is very little that is different from the awful monotony of past days.' On the following morning they reached the Pole exactly. A little way distant from it they found the tent which the

Norwegians had left behind them, with the record of five men having been there just over a month previously. In it, among other things, there was a note left by Captain Amundsen asking the finder to forward a letter to King Haakon. Scott himself left a note there to say that he had 'visited the tent with companions.' A grim variation this on the ceremony of signing the visitors' book! 'We built a cairn, put up our poor slighted Union-Jack, and photographed ourselves-mighty cold work all of it.' About half a mile south they espied an old underrunner of a sledge sticking up in the snow, which seemed to be intended to mark the exact spot of the Pole as near as the Norwegians could fix it, a note attached indicating that the tent was 'There is no doubt two miles from the Pole. that our predecessors have made thoroughly sure of their mark, and fully carried out their programme. . . . We carried the Union-Jack about three-quarters of a mile north with us, and left it on a piece of stick as near as we could fix it. . . . Well, we have turned our back now on the goal of our ambition, and must face our eight hundred miles of solid dragging; and good-bye to most of the day-dreams!'

¥

* This great tragedy has all the elements of perfect dramatic construction. The crisis of the story to which all the action had been leading up came when the black flag of Amundsen was seen above the polar snow. From that moment, the plot being fully revealed, there was a quick and simple descent, one and then another of the characters disappeared from the stage, Evans and splendid Captain Oates, and then in that awful silence the curtain fell, and the play was done. Scott himself cut down the last act to fifty pages of the nearly six hundred that are given to the full story. Troubles very soon beset the conquerors of the Pole. They were as cheery as they could be; they were brave always. Little bits of comfort were gathered from random thoughts. Scott stops in his diary once to make the reflection, when they were nearly three weeks backward from the Pole: 'It is satisfactory to recall that these facts give absolute proof of both expeditions having reached the Pole, and placed the question of priority beyond discussion.' The pathos of it! With a terrible certainty the gloom of their impending fate gathered about them. On 2nd March it is written: 'We are in a very queer street, since there is no doubt we cannot do the extra marches, and feel the cold horribly.' Two days later: 'Things looking very black indeed. . . . We are in a very tight place indeed, but none of us despondent yet, or at least we preserve every semblance of good cheer, but one's heart sinks as the sledge stops dead. . . . Providence to our aid! We can expect little from man now except the possibility of extra food at the next depôt!' Nearly a fortnight afterwards it was 'tragedy all

along the line. At lunch the day before yesterday, poor Titus Oates said he couldn't go on; he proposed we should leave him in his sleeping-bag. That we could not do, and induced him to come on, on the afternoon march. In spite of its awful nature for him he struggled on, and we made a few miles. At night he was worse, and we knew the end had come. Should this be found I want these facts recorded. Oates's last thoughts were of his Mother; but immediately before he took pride in thinking that his regiment would be pleased with the bold way in which he met his death. We can testify to his bravery. He has borne intense suffering for weeks without complaint, and to the very last was able and willing to discuss outside subjects. He did not —would not—give up hope to the very end. He was a brave soul! This was the end. He slept through the night before last, hoping not to wake; but he woke in the morningyesterday. It was blowing a blizzard. He said, "I am just going outside, and may be some time." He went out into the blizzard, and we have not seen him since. I take this opportunity of saying that we have stuck to our sick companions to the last. In the case of Edgar Evans, when absolutely out of food, and he lay insensible, the safety of the remainder seemed to demand his abandonment; but Providence mercifully removed him at this critical moment. He died a natural death, and we did not leave him till two hours after his death. We knew that poor Oates was walking to his death; but, though we tried to dissuade him, we knew it was the act of a brave man and an English gentleman.'

On the 29th of March, when they had been confined for several days to their tent by a blizzard that was howling across that awful Southern waste, food having given completely out some time before, the last words were written in the diary: 'Since the 21st we have had a continuous gale from W.S.W. and S.W. We had fuel to make two cups of tea apiece and bare food for two days on the 20th. . . . We shall stick it out to the end, but we are getting weaker, of course, and the end cannot be far. It seems a pity, but I do not think I can write more.—R. Scorr.' And then in a separate line underneath the signature was the last lone cry-'For God's sake look after our people.' A few letters to relatives and friends and a 'Message to the Public' had been written. To his old superior officer, Vice-Admiral Sir Francis Charles Bridgeman: 'I fear we have shipped up; a close shave. I am writing a few letters which I hope will be delivered some day. . . . I want to tell you that I was not too old for this job. It was the younger men that went under first. . . . We could have come through had we neglected the sick.' To another: 'The Great God has called me, and I feel it will add a fearful blow to the heavy ones that have fallen on you in life. But take comfort in that I die at peace with the world and myself-not afraid.

And there, some time later, those great men, finest jewels of their race, were found asleep for ever. Eternal snow lies upon their bodies now; God has taken their souls to His own everlasting care.

A KNIGHT ON WHEELS.

CHAPTER IV .- HEREDITY.

ON Tuesday morning Uncle Joseph went away to the City as usual, and Philip was left to his own devices. Monday had been a heavy day, for all the new appeals had been copied out and sent off. All, that is, except three. Master T. Smith's elaborately ill-spelt epistles required time for their composition, and each of course had to be copied out by hand, for it was not to be supposed that the Smiths possessed a typewriter. So, when after breakfast Uncle Joseph discovered on the bureau three stamped and addressed envelopes still awaiting enclosures, he directed Philip to indite three additional copies of Master T. Smith's celebrated appeal for a little sister, and post them with the others.

When Uncle Joseph had gone Philip set about his task, but with no great zest. As a rule he took a professional pride in his duties, and, moreover, extracted a certain relish from his uncle's literary audacities. The reader will possibly have noted that at this period of his career Philip's sense of humour was much more highly developed than his sense of right and wrong. But during the past few days something very big had been stirring within him. Some people would have called it the voice of consciencethat bugbear of our otherwise happy childhood. Others would have said with more truth that it was Heredity struggling with Environment. As a matter of fact it was the instinct of Chivalry, which, despite the frantic assurances of a certain section of our sisters that they stand in no need of it, still lingers shyly in the hearts of men, a survival from the days when a woman admitted frankly that her weakness was her strength, and it was a knight's glory and privilege to devote such strength as he possessed to the protection of that weakness.

Philip no longer found himself in sympathy with Uncle Joseph's enterprises. It was not the enterprises themselves to which he objected, for he realised that no one was a penny the worse for them, while many were considerably the better. But all the newly awakened heart of

this small knight of ours rebelled against the idea of imposing upon a woman. Philip felt that Uncle Joseph must be wrong about women. They could not be what he thought them; at least, not all of them. And even if Uncle Joseph were right in his opinion, Philip felt positive of one thing, and that was that no woman, however undeserving, should ever be hardly treated or made to suffer for her own shortcomings. And to this view he held tenaciously for the rest of his life.

At the present moment it caused him acute unhappiness to be compelled to sit down and pen sloppy effusions to little girls with whom he was not acquainted, asking them to be so good as to consent to become his sisters, or as an alternative send a postal-order by return. But he was loyal to the hand that fed him and to the man who had been his father and his mother for the greater part of his little life. He wrote on, steadily and conscientiously, until the three letters were copied out and ready for the post.

But it is impossible to do two things at once. You cannot, for instance, write begging letters and think of blue cotton frocks simultaneously. In copying out the last letter, Philip, owing to the fact that his wits were wandering on Hampstead Heath instead of directing his pen, was

guilty of a clerical error.

The residence of Master Thomas Smith, it may be remembered, was situated at 172 Laburnum Road, Balham; though over-zealous philanthropists, bent upon a personal investigation into the sad circumstances of the Smith family, might have experienced some difficulty in piercing its disguise as the shop of a small tobacconist. Now Philip, instead of writing out this address at the head of the sheet of dingy silurian notepaper upon which T. Smith was accustomed to conduct his correspondence, absent-mindedly wrote 'Holly Lodge, Hampstead, N.W.'—a lapsus calami which was destined to alter the whole course of his life, together with that of Uncle Joseph, besides bringing about the dissolution of an admirably conducted little business in the begging-letter line.

After this he folded the letter and fastened it up in the last envelope—which, by the way,

was addressed to

The Little Girl
Who Lives with
Lady Broadhurst,
Plumbley Royal,
Hants—

and sat down to luncheon. It was a cold and clammy meal, for it was washing-day, and the only hot thing in the house was James Nimmo, who, in the depths below, entangled in a maze of moist and clinging draperies, was groping blasphemously in the copper for the blue-bag. Washing-day was James Nimmo's day of humiliation. Uncle Joseph had offered more

than once to have the work sent out to a laundry; but James Nimmo persisted in doing it himself, though the lamentable behaviour of the maids next door, what time he hung the crumpled result of his labours out upon the drying-green, galled him to the roots of his being.

After luncheon, Philip, calling downstairs through a cloud of steam that he was going out to the post, took up the letters and his cap and ran out of the house, down the short gravel-

sweep, and up the road.

Twenty minutes later he might have been observed diligently scouring Hampstead Heath in search of a blue cotton frock and a cerise leather belt.

'Hallo, Phil!' remarked Miss Falconer, hastily crumpling up her handkerchief into a moist ball and stuffing it into her pocket. Her back had been turned, and she had not noticed his approach.

Philip climbed up on the gate beside her.

'Tell me what you have been doing since I saw you last,' commanded Peggy at once.

'I have been helping Uncle Joseph,' said Philip rather reluctantly. He was not anxious to be drawn into details upon this topic.

'Uncle Joseph!' The little girl nodded her head with an air of great wisdom. 'I have

been talking to mother about him.'

'What did you tell her?'

'I told her what you told me about his not liking women; and I asked her why she thought it was.'

'What did she say?' inquired Philip, much interested. Of late he had been giving this point a good deal of consideration himself.

'She said,' replied Peggy, evidently quoting verbatim and with great care, 'that there was probably only one woman in the world who could give an answer to that question, and she never would!'

'What does that mean?' inquired the obtuse

Philip.

'It means,' explained Peggy, adopting the superior attitude inevitable in the female, however youthful, who sets out to unfold the mysteries of the heart to a member of the unintelligent sex, 'that Uncle Joseph was once fond of a lady, and she threw him over.'

'But I don't think that can be true,' said Philip deferentially. 'Uncle Joseph isn't fond of any ladies at all. You have only to hear him talk about them to know that. He thinks they are an incu—incu—something. Anyhow, it means a heavy burden. They are Parasites, too. He says the only way to do one's work in life is to keep away from women. How could he be fond of one?'

'I expect he didn't always think all those things about them,' replied Peggy shrewdly. 'Men change with disappointment,' she added, with an air of profound wisdom.

'How do you know that?' inquired Philip

respectfully. Such matters were too high for him.

'I have often heard mother say so,' explained Peggy, 'after father has been in one of his tempers.'

Philip pondered. Here was a fresh puzzle. 'How can your father have been disappointed?' he asked. 'He is married.'

'It wasn't about being married that he was disappointed,' said Peggy. 'You can be disappointed about other things, you know,' she explained indulgently.

'Oh!' said Philip.
'Yes. Haven't you ever been disappointed yourself, wanting to go to a party, and not being allowed to at the last minute, and all that?

'Oh yes,' agreed Philip. 'Not parties, but other things. But I didn't know grown-up people could be disappointed about anything. I thought they could do anything they liked.'

Hitherto Philip, simple soul, had regarded disappointment and hope deferred as part of the necessary hardships of youth, bound to melt away in due course, in company with toothache, measles, tears, treats, early bedtimes, and compulsory education, beneath the splendid summer sun of incipient manhood. Most of us cherish the same illusion; and the day upon which we first realise that quarrels and reconciliations, wild romps and reactionary dumps, big generous impulses and little acts of petty selfishness, secret ambitions and passionate longings, are not mere characteristics of childhood, to be abandoned at some still distant milestone, but will go on with us right through life, is the day upon which we become grown-up. To some of us that day comes early, and whenever it comes it throws us out of our stride, sometimes quite seriously. But in time, if we are of the right metal, we accept the facts of the situation, shake ourselves together, and hobble on cheerfully enough. In time this cheerfulness is increased by the acquisition of two priceless pieces of knowledge-one, that things are just as difficult for our neighbour as ourself; the other, that by far the greatest troubles in life are those which never arrive, but expect to be met half-way.

It is the people who grow up early who do most good in the world, for they find their feet soonest. To others the day comes late, usually in company with some great grief or loss, and these are most to be pitied, for we all know that the older we get the harder it becomes to adapt ourselves to new conditions. Many a woman, for instance, passes from twenty years of happy childhood straight into twenty years of happy womanhood and motherhood without speculating very deeply as to whether she is happy or not. Then, perhaps, the Reaper comes, and takes her husband, or a child, and she realises that she is grown-up. Her life will be a hard fight now. But, aided by the sweetness and strength of memory, accumulated throughout the sunny years that lie behind, she too will win through. There are others, again, to whom the day of growing-up never comes at all. They are the feeble folk, perpetually asking 'Why?' and never finding out. Still, they always have to-morrow to look forward to, in which they are more fortunate than some.

Meanwhile Miss Marguerite Falconer was explaining to the untutored Philip that it is possible for grown-up people to suffer disappointment in two departments of life—the only two, she might have added, that really mattered at all—Love and Work.

'How was your father disappointed, exactly?' asked Philip.

'He painted a big picture,' said Peggy. 'He was at it for years and years, though he was doing a lot of other ones at the same time. called the other ones "wolf-scarers," because he said there was a wolf outside on the Heath that wanted to get in and eat us, and these pictures would frighten any wolf away. I used to be afraid of meeting the wolf on the Heath myself'-

'You were quite small then, of course,' put in

Philip quickly.

Miss Falconer nodded, in acknowledgment of his tact, and continued: 'But nurse and mother said there wasn't any wolf really. It was a joke of father's. He often makes jokes I don't understand. He is a funny man. And he didn't use the pictures to frighten the wolves with really; he sold them. But he never sold the big picture. He went on working at it and working at it for years and years. He began before I was born, and he only finished it a few years ago, so that just shows you how long he was. Whenever he had sold a wolf-scarer he used to get back to the big picture.'

'What sort of picture was it?' inquired Philip,

deeply interested.

'It was a very big picture,' replied Peggy.

'How big ?'

Peggy considered. 'Bigger than this gate we are sitting on,' she said at last. 'It was called "The Many-Headed." Father sometimes called it Deemouse too-or something like that.'

'What was it like?'

Peggy's eyes grew quite round with impressiveness. 'It was the strangest thing,' she said. 'It was a great enormous giant, with heads, and heads, and heads! You never saw such a lot of heads.'

'I expect that was why it was called "The Many-Headed," observed Philip sapiently.

'What sort of heads were they?'

'They were most of them very ugly,' continued 'They were twisting about everywhere, and each one had its mouth wide open, shouting. Dad kept on putting new ones in. There always seemed to be room for one more—like sticking roses in a bowl, you know; only, these heads weren't like roses. After a Bank Holiday he nearly always had two or three fresh ones.'

'Why?'

'He used to go out then on the Heath—to study the canal, he said, and get fresh sketches.'

Philip, who was inclined to be a little superior on the subject of London geography, announced firmly that there was no canal on Hampstead Heath. 'Only in Regent's Park,' he said. 'Besides, why should he sketch a canal?'

It was Peggy's turn to be superior. 'Canal,' she explained, 'is a French word, and means people—people with concertinas and bananas, who sing and wear each other's hats, and leave paper about. Dad would sketch them when they weren't looking, and then put them into the picture. Oh, I forgot to tell you that the giant had great huge hands, and he was clutching everything he could lay his hands on—castles and mountains and live people. He had a real king, with a crown on, between his finger and thumb.'

'What about the disappointment?' asked

Philip.

'The disappointment? Oh yes, I forgot. Well, at last the picture was finished and sent away, in a lovely frame. But it came back. One afternoon I went into the studio, and there was father. He was sitting very quiet and still on a little stool in front of the picture. He never moved, or looked round, or said, "Go away!" when I came in. I was so surprised. For a long time he had been having a lot of bad tempers, so when I saw him sitting so still and quiet I was quite frightened. I went and stood beside him, and looked at the picture too. Then he saw me, and said, "It has come back, you see, Peggy!" He said it two or three times, I think. "There are eight years of a man's life in that picture, eight years of a man's body and blood and bones! And it has been sent back—sent back by a parcel of promoted house-painters who daren't let such a piece of work hang on their walls because they know it would kill every filthy daub of their own within reach!"

'Then he asked me what we should do with it. I said—of course I was quite small then that I thought if he took it and showed it to the wolf it would frighten him away altogether. That made father laugh. He laughed in a funny way, too, and went on so long that I thought he would never leave off. At last he stopped, and made a funny noise in his throat, and said, "No, we won't do that. I will show you a more excellent way." He said that two or three times over, like he did before. Then he got up, and went and pulled a big sword and dagger out of a rack of armour and stuff in the corner, and said, "Now for some real fun, Peggy!" and we cut up the picture into little bits. Father slashed and slashed at it with the sword, and I poked holes in it with the dagger.'

'What fun!' said Philip, the chord of destruction thrilling within him.

'Yes, wasn't it? I remember I cut the king with the crown on right out of the picture, with the giant's finger and thumb still round him. I kept it for a long time, but I lost it at last. When we had slashed the picture all to bits, dad tore it out of its frame and rolled it up into a bundle and threw it into a corner. Then he went out for a long walk, without his hat. When mother came home she cried. It was the only time I ever saw her cry. I didn't know till then that grown-up people did. I cried too. I was little then.'

'Has your father painted any more pictures?' asked Philip, diverting the conversation.

'No, never. He only paints wolf-scarers now. I tell him what to paint.'

Philip's eyebrows rose, despite themselves.

'Yes, I do!' maintained Miss Falconer stoutly. 'The other day he said to me, "Here, Peggy, you understand the taste of the Hoypolloy'—that's another French word for people—"so give me an idea for a pot-boiler." He calls wolf-scarers pot-boilers sometimes; I don't know why. And I said, "Well, I think it would be nice to have a picture of a little girl in a lovely frock, with a new doll, showing it round the dolls' house and introducing it to all the other dolls." He laughed and said, "That's capital. I bet a sovereign they put that one on the line." When I asked what line, he said, "The clothes-line." He is a funny man,' concluded Peggy once more.

They sat on for some time, discussing adult peculiarities. Finally Philip announced that he must go, for Uncle Joseph would return at four o'clock, and expect him to tea. As they parted Philip inquired awkwardly, 'I say, Pegs, will you tell me? I couldn't help wondering about something just now.'

'What was it?' inquired Peggy graciously. Philip asked his question too bluntly.

Miss Peggy's small frame stiffened indignantly. 'I wasn't ever doing any such thing,' she announced in outraged tones.

Philip, whose knowledge of the sex was improving, had the sense to withdraw the imputation and apologise at once. Then he waited.

'Perhaps I was, just a little bit,' admitted Peggy presently.

'What was the matter?' asked Philip gently.

'It was father. He boxed my ears after lunch for making a noise. I was only singing, but he is in one of his bad tempers just now. He will be all right in a day or two.'

Philip, much to his surprise, found himself trembling with indignation. 'Does he do it often?' he asked between his clenched teeth.

'No, not often. Besides, he can't help it. Men are just like children, mother says. You have to make allowances for them. I always try to remember that. The daily work of half the women in the world is to make allowances

for some man or other, mother says. Good-night, Phil!

'Good-night, Pegs!'

The little girl ran off through the gathering gloom, turning to wave her hand before she disappeared.

Philip walked slowly home, pondering in his heart yet another (and quite unsuspected) aspect of the relations between men and women. There were two sides to every question, it appeared. His education was proceeding apace.

(Continued on page 72.)

SOUTH AMERICAN REMINISCENCE.

By Colonel STANLEY PATERSON, F.R.G.S.

MANUEL GASPARRO DE HERRERA and Pedro Antonio Ximenes were buen amigos, and very proud hidalgos as well. True, Pedro's occupation entailed the compounding of pills in a drug-store, while Manuel displayed draperies and lingeries to the soft glances of the mantillaclad beauties of their small Spanish-American town; but these were mere accidents of life which a pure-blooded hidalgo could afford to despise.

A ready revolver discountenanced any impertinent remarks regarding the very Negroid-Indian type of our heroes' physiognomy or the significant darkness of their skins. Even in this ready-to-draw-and-shoot country, these two were noted for their celerity and accuracy; though where they had learnt the art is a mystery to me. Every evening the two friends-attired in their best store clothes, wide Panamás, and beautifully curled mustachios, beneath which protruded a huge Spanish cigar-would walk down the Estrada de Caballo just as the sunglare faded, and saunter into the little plaza on the bank of the great river in which stood the cantina, with its imposing rows of iron chairs and tables, whereto gathered the rank and fashion of the town to gossip and sip seductive cocktails while enjoying the cool night-breeze from the river.

Hither one evening came the bone of contention. She was a little, olive-tinted thing with flashing eyes and soft, full lips, and she coquetted with both at once behind her fan as only a Spanish señorita can do to perfection. Then the two friends quarrelled—not seriously at first, I have heard—till one night each thought he was master, and, with male instinct, wanted her all to himself; then words were used that, between hidalgos, could only lead to blood issue.

Next morning they met on the way to their respective places of business, and I fear used words that I should blush to repeat to you even in Spanish; then, with a polite sweep of sombreros, they parted to drown fate in pills and lingerie.

Evening came, and we all gathered as usual; but no Manuel, no Pedro. No, not till the last possible spectator had arrived did we see anything of them. Then it was dramatic enough. From each end of the eighty yards wide plaza appeared a magnificently dressed figure sweeping

As quick as thought, out came sixa bow. shooters, and the two ran towards one another, firing rapidly. I, foolish foreigner, jumped up to intervene, but was held back by strong hands. My neighbours at the back row of tables placidly smoked on, making bets as to the winner; while those in the front row, nearer the line of fire, beat a hasty retreat behind the cantina. Only a few of the bolder ones, tilting over the iron tables and using them as shields, peered gingerly over the top or round the edges. It was all over in ten seconds. The two men had run towards the centre of the plaza firing fast, and having exchanged their last shots at arm's-length, they fell in a heap together.

Some few of the onlookers ran to see what had happened, but the majority sat still, smoking. Two of the garda de ville swaggered out of the

cantina and took charge of everybody.

I raised poor Manuel, but one glance told me he would sell draperies no more. Three small holes, one low down in the breast, one on the point of the chin, and one full in the centre of the throat, told their deadly tale. Pedro was alive, but had fainted. Manuel, the better shot, had aimed for the heart to kill; Pedro to hit and stop anyhow; and luck was with him, for two bullets in the left side, one above and the other just below the heart, one in the arm, and two holes through his loose jacket as well, told how narrow had been his escape.

Next day the big hall in the governor's casa was crowded to hear the trial of Pedro. Spaniards are nothing if not dramatic; therefore inquest and trial took place at the same time. At one end of the hall sat his Excellency, surrounded by every official who could squeeze in, and guarded by twenty ragged soldiers, another detachment of thirty standing at the back of

the hall.

Stretched on a table immediately in front of the governor lay the body of poor Manuel, still in his blood-stained clothes, his blanket poncho hung on a chair alongside. Between two carabineros sat Pedro, pale, wan, and bandaged.

All this was impressive, and, until the Government attorney had finished his indictment, even striking. Then, to our British ideas of courts of justice, all was chaos. Who was judge, jury, or witness I never discovered. All spoke at once, and every one ventilated his opinion freely,

moving about in the court, conversing with the prisoner, and often indecently uncovering the corpse. After about an hour of this the jefe civil, or chief magistrate announced that Pedro was sentenced to a year's imprisonment; and, smiling feebly, the wounded man was carried off to the prison hospital.

A few days later I departed on an expedition to the mountains. Returning to the little town, after an absence of some seven weeks, just as the plaza was filling for the evening gossip, I saw Pedro, even more gorgeous, and with a bigger cigar than formerly, surrounded by an admiring crowd of youths.

The next morning I went to the drug-store and purchased something quite unneeded. Pedro, with the air of an emperor, was compounding pills as usual. Yes, gracias à Dios, he was now well, and suffered little discomfort from his wound; but cui bueno, that Manuel's successor was flirting desperately with the señorita, and he could not shoot him also so soon-no, not just so soon, could he? Ah, the prison? Well, his friends had a few pesos (dollars); therefore as soon as he could leave hospital the governor pardoned him, and he went back to his pills.

So they do things in the West.

ROSEMARY COURT.

CHAPTER VII.

THE shadow of the wings of death had lifted from Rosemary Court, and Madam was about again, though, alas! never to be Madam St Bruyere as of yore. All her old imperiousness had gone, and the way in which she had become dependent upon others had something pathetic in it. She was well enough to sit out in the garden and do a certain amount of work, but not for long. She seemed to be watching Rupert in a helpless, appealing way, as if mutely asking his forgiveness for some unspeakable wrong. If Cecilia noticed this, she said nothing. She was the only bright thing about the house now; she had been a veritable angel of light and cheerfulness in the sickroom, and nothing seemed to dim the brightness of her smile or the radiance of her What she had become to Madam only that poor broken woman knew. But the most grim and silent of them all was Rupert. was very busy, he said; there was so much to look after now. He was under the impression that Cecilia knew nothing of the trouble that oppressed him. He had a good deal to learn yet about women, had Rupert St Bruyere.

It was one sunny August afternoon that Madam had elected to remain in the seclusion of her room when Cecilia surprised Rupert in a comparatively idle moment. 'You are just going to sit here,' she said, 'and tell me the cause of

all the trouble.'

'We all have our worries,' Rupert said

evasively.

'Ah, but this is no ordinary trouble. think that because I am young and frivolous I have no feelings. The long face is not good for the invalid. Did not the doctor say that I was a born nurse? You think perhaps I am not worthy to be taken into your confidence. I lie awake at night and worry over that. Rupert, I want to help. I want to show my gratitude for all the kindness I have received. And if I am a burden to you in this house'-

She paused with quivering lips. Here was a

new and pleasing side-light on Cecilia's character. Her blue eyes were steadfast and earnest now; and, besides, she was talking to a man who was aching for sympathy. He took her hands and held them firmly.

'I have been wrong,' he murmured. 'And yet, Heaven knows, I have tried to act for the best. Cecilia, a little time ago I had hoped to ask you a certain question.'

'You have already done so,' the girl said demurely. 'Not in so many words perhaps,

but your eyes'-

'But I am ruined,' Rupert cried. 'We are all ruined. This old house will have to go. shall be compelled to sell it for less than half its worth. The farms have been allowed to get into a poor condition; the tenants have grown slack for want of proper handling. Of course you know that Madam is absolute mistress here. I suppose she had a dim idea of what was going to happen, for she has been speculating for years. The property is mortgaged to the last penny, and there are debts beside. Nothing less than fifty thousand pounds can save the situation. The house will have to be sold, and I must go abroad and make another start.'

'But you have money saved,' Cecilia urged-'quite enough to take a farm here. Madam told me as much quite proudly. It would be a great wrench to you to leave Rosemary Court; but there are worse troubles. I would come along with you and Madam, if you would have me, and work like any dairymaid. Oh, I am not afraid of work! You will let me have my own way, Rupert? Of course I could go back to the stage again; but I have learned to love this place.'

'But all my money has gone,' said Rupert. 'It required every penny to keep the roof over our heads and to hold on till we could sell the property at a fair price. If I could possibly raise sufficient capital to stock a farm it would be different matter. And I would never let you

then, Cecilia.'

He bent over her suddenly, the light of love and affection in his eyes. It was only for a moment, and then he saw the answering reflection in her own. She held out her hands to him and swayed, with a little cry, into his arms.

'You might have known! Oh, you might have known!' she whispered. 'Just as if there could have been anybody else but you. I seemed to feel it from the first moment when we met in the dear old curé's garden at Amyans. I wanted to come, and yet I was afraid. And no girl could have been happier than I have been at Rosemary Court. And then gradually, as I realised that you were getting nearer and dearer to me——Oh Rupert! are you going to leave me to do all the lovemaking? If you only knew'——

The tears and smiles chased across her lovely April face; then Rupert kissed the quivering red lips passionately. There was no help for it; his stern resolutions were swept away in a flood of tenderness, and he could see no trouble or sorrow in that golden moment. But what did it matter, what did anything matter, so long as he had this glorious creature by his side and her kisses were still warm upon his lips? There must be a way out somewhere.

'Well, I have done it now,' he said half-humorously, half-sadly. 'When the trouble came I resolved to put you out of my heart; but I suppose you crept back when I wasn't looking. Dearest, we are two penniless lovers, with all the world before us. That I am a St Bruyere is a boast unlikely to put a penny in my pocket. If I had guessed this, if I had been conceited enough to believe that you really cared for me, I would never have parted with that thousand pounds. With that I could have made a home for Madam and your own sweet self. But it is useless to talk like this.'

Cecilia declined to take this gloomy view. Into her brain there crept the germ of an idea which sooner or later might resolve itself into a practical scheme. But of this she said nothing for the moment. She would keep it for a pleasant surprise for later on; and if she failed, then nobody would be disappointed. She would discuss the matter with Sir Charles. It was no far cry from Rosemary Court to Winstay, where that eccentric genius lived, and he made little of the journey with his big car. He had fallen into the habit lately of coming over most afternoons to inquire after the invalid, and beg a cup of tea at Cecilia's hands. He would have repudiated the suggestion; but, like everybody else, he was one of Cecilia's devoted slaves. He came at an opportune time the following afternoon, for Madam was resting in her room, and Rupert had ridden over to one of the outlying farms. Sir Charles looked quizzically over his tea-cup at the girl's radiant face.

'So you have got something to tell me?' he asked. 'Oh, you need not shake your head! It's only once in a lifetime that a girl's eyes

shine with the light that gleams in yours. I suppose it is Rupert. Well, he is a good fellow; though just lately I was afraid that he was going to make a quixotic ass of himself.'

'I think he would have if I had let him,' Cecilia said demurely. 'Sir Charles, I am positivelly afraid of you. Your intuition is almost uncanny. You have guessed the trouble here?'

uncanny. You have guessed the trouble here?'
'My dear child, I have known it was coming for years. I knew it when that picture—
But this is gossip. So there is no money, and you are all going to be turned out of this delightful paradise. Question is, what's Rupert going to do?'

Cecilia told the speaker quite candidly. Rosemary Court would have to go, of course; but could Sir Charles see his way to do anything?

'Well, candidly, I can't,' he said. 'You will be much happier if you win through for yourselves. I was once in love myself. I was a young fool in those days, and deemed every woman to be an angel. When I lost everything I went to the adored object and told her. I went for sympathy, and—well, I didn't get it. When my fortunes began to mend she would have whistled me back again, but the scalded dog had learnt another call by that time. I rather fancy that I was very much cut up for the moment.'

Sir Charles yawned as he replaced his eyeglasses; but behind this elaborate cynicism Cecilia's instinct told her that she was listening to the tragedy of a spoilt life.

'I understand,' she said. 'You are not so hard as you pretend to be. And you're perfectly right. Now, Sir Charles, I want you to help me to help them. They have been very good to me, and up till now the kindness has been all on one side. This thousand pounds has got to be found, and I will find it. You told me on the night of the duchess's dance that those stage diamonds might be worth something, especially as they belonged to my mother. Do you think it would be possible to sell them for the sum we need?'

Charles St Bruyere smiled. There was something about him at that moment intensely sympathetic and human.

'It is a pretty idea,' he said, 'and charmingly conceived. This is a secret for the moment, I suppose? Give me your gems and I will see what I can do with them. Oh yes, I can get you the sum you need for the stones, and perhaps a little more.'

CHAPTER VIII.

THE burden of grief lay all the more heavily upon Madam's shoulders because of the kindness and sympathy of all those about her. There had been no recriminations and no reproaches, nothing but a desire to make the best of the calamity. It seemed almost incredible

that this stately old lady, with her apparent aloofness from the world, should have been familiar all these years with the vulgar jargon of the City. But all that was past and done with now; everything had gone, and it was necessary to face the future. Meanwhile to all outward appearances life at Rosemary Court was going on the same as usual. The servants went about their appointed tasks; the velvet lawns were rolled and shaven day by day; the roses were still blooming in the garden.

The candles in the silver sconces in the diningroom had been extinguished, and Madam was
seated in her customary corner in the long oakpanelled salon. She looked older, more white
and fragile, and at the same time more soft and
womanly. It was sad to see the pathetic way
in which she turned to Rupert for advice. Even
Cecilia came in for her share of the burden.
They were seated there, under the shaded lamplight, discussing the future, as they did every
night now. Cecilia lay back, shading her eyes
as she listened. There was a smile upon her
face despite a certain restlessness which she was
evidently at some pains to disguise.

'Oh, nobody is to blame,' she said. 'It was all done for the best. If Madam had been successful'——

'Ah, if /' Madam sighed. The word was a tragedy in itself. 'I have not been successful. I have ruined myself and everybody that I loved. If we could sell the old place'——

'So we could if we had time,' Rupert said sorrowfully. 'If we had a little breathing-space it would not be a very difficult matter to find a purchaser who would give what the estate is really worth. That would afford me a margin quite sufficient to take over one of the farms and stock it properly. But it is useless to speak of that. No interest has been paid on the mortgage for over a year, and I am afraid that any moment the mortgagees may give notice of foreclosure. Salvation does not lie that way.'

Cecilia listened with eyes that sparkled strangely. 'May I ask a few questions, Rupert dear?' she said. 'May I try to be businesslike? How much money would you need to get rid of the people who are troubling you so?'

'Fifty thousand pounds. In addition to that we should want a patient mortgagee who would not mind waiting for his interest and be prepared to—— Oh my dearest girl! the fairies are all dead now. I am beginning to doubt whether Cinderella ever had a fairy godmother. It is only business men who have money nowadays, and it is because they are business men that they would not look at the romantic mortgage I have in my mind. All the same, there is nothing the matter with the security. Have you got anything on your mind?'

Cecilia laughed. It was the first time anybody in the house had laughed for days. But then she was always bright and smiling. Looking at her with loving eyes, Madam murmured that she filled the house with sunshine.

'Why not?' Cecilia said. 'Why not myself? Why should I not sell my mother's diamonds and sink the money in the property? It would be what you call a good investment. And, besides, you would not feel under the slightest obligation to me. I would come to you and demand my interest on the moment. You would find me a grasping creditor, the most greedy and ferocious.'

'Oh, that would be all right,' Rupert laughed. 'We could take the money from you in circumstances like that; but these are the things that only happen in books, little sweetheart.'

'Not always,' Cecilia said demurely. 'Now let me tell you a little story. You have both heard of Countess Vittoria Lubinski, the great

singer and prima donna.'

'Perhaps the greatest of all time,' Madam murmured. 'And she was one of us, too. She had royal blood in her veins. In my young days it was one of my delights to go and hear her sing. And she was the personal friend of more than one sovereign. Oh, a grand specimen of a woman! She came here to stay once many years ago, when your mother was quite a child.

Why do you laugh, Cecilia?'

'I was wondering where the difference lay between a great singer and a great actress. But then that is a subject upon which we shall never agree. Still, I am glad that you loved and honoured Vittoria Lubinski, because it gives me courage to tell my story. Now you must know that for years, indeed up to the day of her death, the great singer was the best friend my mother ever had. They met whenever it was possible; they wrote to one another regularly. And not long before the end came Countess Lubinski gave certain things to my mother. Amongst these gifts were the stage jewels which you saw me wear on the night of the duchess's dance. My mother wore them frequently in certain parts. And they were imitation, mind you. It was always Countess Lubinski's fancy never to appear in real gems. The newspapers commented on the fact over and over again. But the countess only laughed; she was quite satisfied, for she had no worry or bother over her gems, and there was no chance of her being made a mark for thieves. Everybody knew that my mother was accustomed to wear those famous stage jewels, and I was quite easy in my mind when I put them on for the dance.

'What does all this lead to?' Rupert asked.

'I am coming to that,' Cecilia went on. 'At that dance Sir Charles St Bruyere admired the jewels. He knew their story before I told him. He told me in his humorous way that they had a sentimental value, and that if I needed money he could sell them for me. Now please don't laugh. When this trouble came I was so anxious to find Rupert the thousand pounds he

needed to take his farm! I saw Sir Charles here one day, and he was quite sure he could get that money. Oh, you cannot tell how it pleased me! And now I have heard from Sir Charles, and he has sent me the cheque. He has also written me a letter, which I will read to you.'

Her voice was low and unsteady now, and her hand as she unfolded the letter shook strangely.

Then she read as follows:

'My DEAR CHILD,—There are some lucky persons who are destined to pass their lives in an atmosphere of romance. These people are invariably and nearly always picturesque. To be picturesque is the next best thing to absolute genius. Now I dare say you will wonder what this is leading up to, but I must tell my story in my own way.

'On the night of the duchess's dance I made a discovery. I stumbled quite by accident upon the hitherto unwritten chapter of a charming little romance. It flattered my vanity to know that I am still astute enough to distinguish between the false and the true, and I did so, as

you will see presently.

'Now for many years I had the honour of enjoying the friendship of Countess Vittoria Lubinski. I knew all her charming conceits and moods. I knew the jest connected with her stage diamonds, but I never happened to be near her when she was wearing them. This same remark applies equally to your dear mother. My first close acquaintance with the stones was at the duchess's ball. When you asked me to sell them for you, I said that they might fetch more than a thousand pounds. And I was a true prophet, as you will see by the enclosed cheque.

'For that incomparable singer had deceived us all. I rather fancy that your mother knew, and doubtless would have told you had her end not come so suddenly. For, you see, the countess never wore sham jewellery. She adopted this little scheme to save herself from trouble and annoyance and danger from the thieves who always have a predatory eye upon the valuables of famous people. It is just as well that these things should be sold, because they are always a source of anxiety, and now you will be in a position to furnish the farm for cher Rupert. A thousand congratulations.

'I shall come over to-morrow to offer my feli-

To-night you will prefer citations in person. that no stranger intrudes upon the sacredness of the family circle. With all respect, yours sincerely. CHARLES ST BRUYERE.

P.S.—Cheque for £52,000 (less commission) enclosed.'

A long silence followed. The tears were running down Madam's face; she was weeping unaffectedly.

Rupert's face looked just a little stern and hard in the subdued light. 'Marvellous,' he said at length. 'I suppose I must congratulate you, Cecilia. Of course what you said just now about redeeming the mortgage was a mere figure of speech. You will quite see that it is utterly impossible for me to take it.'

Cecilia rose from her seat and placed her hands upon Rupert's shoulders. There was an unsteady smile upon her lips, a great light burning in her eyes. She spoke almost in a 'Tell me that you no longer love me,' whisper.

she said.

'Oh, how can I? It is only now this thing has come between us that I am beginning to realise that I have lost everything.

'And you call that speaking like a man of

honour?

'Could a man of honour behave in any other

way, Cecilia?

'Yes, he could, you silly boy!' Her face was very close to his now; the white arms were tightening about his neck. 'You said just now that these things only happened in books. You said if I could find the money I could take up the mortgage. And you said it would be a desirable investment for anybody's money. Oh my dear boy, I don't want to make a business matter of it. For you have all been very good to me, and it would break my heart to leave this old house now. And if you tell me that you love me any the less because I am in a position to help, if you want to rob me of the sweetest and happiest moment of my life-Oh Rupert! Rupert!'

They were all alone as far as he was concerned; the world seemed to resolve itself into himself and the girl who lay in his arms. Then the hard look faded from his face as he kissed her. And after that there was no more

to be said or done.

THE END.

THE MONTH: SCIENCE AND ARTS.

DEVICE FOR PREVENTING THE TELESCOPING OF RAILWAY CARRIAGES.

THE extreme liability of the carriages used upon British and Continental railways to telescope, as revealed by recent disasters, is dis-

turbing to our peace of mind. Apparently the speed of the following and colliding train, and consequently the force of the impact, matters little, inasmuch as in the London disaster at Waterloo the telescoping action was as destructive as in the Aisgill collision. The tendency to

telescope is due to the method of attaching the body of the carriage to the trucks. In order to secure the minimum of vibration and maximum of comfort when running at high speed, and in order to ensure that sharp curves will be taken safely, the cars are mounted on bogie trucks, the connection being by means of a central or 'kingpin,' which acts as a pivot, thereby allowing the wheeled truck to take up all oscillation. under-frame of the coach is heavy and substantially made, and is so designed that the shock arising from a severe impact is absorbed; but although the momentum of the trucks can be arrested by the application of the brakes, there is no means of effecting the same object with the body. result is that in a collision the body rides up and becomes detached from the truck, driving its way through the coach in front and reducing it to matchwood. Recently a very ingenious and simple device has been adopted by the carriage engineering department of the Grand Trunk Railway of Canada, whereby telescoping is effectively prevented. The hole which receives the pivot or 'king-pin' connecting the truck and body is enlarged, and two heavy flange keys are inserted. The upper flange of each piece grips the bolster of the body, while the lower flange in turn engages with the bolster of When the 'king-pin' is driven home the truck. it forces the flange-pieces apart, so that the flanges obtain the maximum hold. Accordingly, when a collision occurs the body of the coach cannot ride upward because of the flange-keys, and the greater the wrenching force exerted the more tightly the two are gripped together. Consequently, as the trucks are pulled up at the moment of impact by the severe action of the Westinghouse brake, the momentum of the body is also arrested. The impact is absorbed by the under-frame of the coach, which is made especially strong and massive for this purpose; while the weight of the wheeled truck, varying from four to six tons, assists in maintaining the vehicle in a vertical position. There is another advantage possessed by American passenger-coaches which might well be adopted on this side. the construction of the fastest expresses steel alone is utilised. The floor of the coach is built up of steel beams and cement, assuring extreme solidity and strength. Such a practice, of course, increases the weight of the vehicle, ranging from forty-five to sixty tons, which is about twice the weight of a British coach. In this country there appears to be an aversion to steel coaches, except on the underground railways, as the dead-weight of the train is thereby increased considerably; but this objection has been met in America by the use of more powerful locomotives. An average American express train weighs about six hundred tons; a British train of equal passenger-carrying capacity weighs less than two hundred and fifty tons. The employment of steel coaches in America and Canada has reduced the dangers arising from collision very appreciably, many accidents having occurred recently without causing any ill effects to the passengers, although severe enough to reduce a wooden coach to splinters. This improvement by the Grand Trunk Railway of Canada is the first practical attempt to overcome the danger of telescoping, and it has proved so successful that it is now being extensively adopted. The invention, in combination with the all-steel carriage, has rendered high-speed railway travel immeasurably safer than is possible under the present British practice.

THE ELECTROLYTIC PRESERVATION OF FOOD.

In the last issue of the Journal we described a handy and inexpensive electro-blanchisseur which has been designed for domestic use. inventor of this apparatus, Mr J. T. Niblett, M.Inst.E.E., has since discovered a new field for its application which should render it far more useful in the household, in hotels, restaurants, hospitals, and other institutions, and also to the shopkeeper—namely, the preservation of food. As a result of elaborate experiments and searching tests, an electrolytic solution produced by this means has been found to act as a firstclass preservative. Mr Niblett extended his investigations over a wide field, and the results certainly have proved somewhat startling. Possibly the edible which is most susceptible to rapid decomposition is fish, especially crustaceans and mackerel. The fish used in the trials were procured from Billingsgate Market, and thus were as fresh as it is possible to obtain them. They were exposed in a room which was indifferently ventilated, and where the variations of temperature were somewhat extreme. It was found that whereas the fish sprinkled with fresh water in the manner generally practised by the fishmonger became unfit for human consumption within two or three days, those treated in a similar manner with a diluted solution of electrolysed common household salt and water retained their freshness, sweetness, and attractive appearance for twelve or fourteen days. But a more startling result was observed. The fish which had been sprinkled with ordinary fresh water, and in which putrefaction had already set in, were submitted to the electrolytic solution, and they immediately lost all unpleasant odour, and were restored to an apparently fresh condition. Of course it must not be assumed that the fish were restored to their original condition; but decomposition was arrested effectively, the antiseptic killing the germs of putrefaction already cultivated, and so rendering the fish quite wholesome and fit for food. Shellfish, such as oysters, mussels, whelks, &c., which are known to be particularly susceptible to contamination with sewage and disease germs, were preserved for a considerable time by periodical immersion in the solution; while lobsters, crabs, prawns, and similar fish

were found to lose all taint and were restored to freshness under the treatment, meat and vegetables being similarly benefited by the application of the antiseptic. The outstanding advantage accruing from such treatment is that the appearance of the article undergoes no change whatever; neither is the flavour impaired in the slightest degree. In fact, it is impossible to tell whether the comestible has been preserved in this manner or not, the electrolytic solution being absolutely harmless, odourless, and colourless. In treating fish it is only necessary to use a solution comprising one gallon of concentrated antiseptic to a few gallons of water; and as the electrolytic solution can be made for one penny per gallon, the cost is trifling. When the preservative loses its electrical activity only common salt remains in solution, and this in itself is a feeble antiseptic, while its presence in small quantities in foodstuffs is distinctly beneficial.

A MOVABLE CROWBAR.

It may be thought that the average crowbar is incapable of much improvement, but an inventor has succeeded in effecting a distinctly ingenious modification of it. The tool is mounted upon two very wide runners, the wheels being placed near the foot, while the shape of the toe is altered; and it can either be employed for the conventional operation of prising, or it can be utilised for carrying loads. The outstanding advantage of the runners is that, owing to the shape of the toe, the crowbar is not liable to slip when in use, while the rollers provide a fulcrum which cannot capsize. At first sight, when ordinarily used, it might be thought that the runners would be a disadvantage; but the rollers maintain a constant tendency to run toward the load which is being lifted or prised. The improved tool is a distinct time and labour saver, and by its use breakages are less likely to occur.

PENNY-IN-THE-SLOT TYPEWRITERS.

The automatic machine has come to be regarded as a necessary adjunct of modern life, and one of its most novel and useful applications is found in many American hotels. This is the penny-in-the-slot typewriter. Any resident in a hotel can secure the exclusive use of the machine in a private room by the insertion of the requisite coin. Clockwork mechanism governs the time paid for, and upon its expiry, or when the machine is left unused, the typewriter becomes automatically locked, and cannot be operated upon until another coin is inserted. The adoption of this system has released the American hotel manager from one of his greatest perplexities, because the typists retained for the benefit of the residents are frequently overtaxed in a rush. The penny-in-the-slot idea places this machine on the same basis as the telephone. It is proposed to introduce the machine into Britain, where doubtless it will be welcomed, as the average hotel is deficient in typewriting facilities required by commercial travellers and other business men. The system enables the machine to be installed in public places, such as railway stations, theatres, restaurants, and upon trains, boats, &c., the company owning the patent machines maintaining them and collecting the money paid.

A SAFE HAMMER-HEAD.

The hammer is a useful tool, but its use is not quite free from danger. The flat, highly polished surface is apt, unless a blow is delivered squarely, to glance off the nail, and when the nail is of cast-metal its head is liable to fly off and inflict nasty injuries. One firm had innumerable accidents from this cause, some of the men being permanently injured. Thereupon hammer-heads having scored faces were adopted as an experiment, and the casualty list immediately shrank to insignificant proportions. Owing to the success of the experiment, the polished-faced hammer has been abolished in that firm's factory except for special classes of work. By roughing or scoring the hammer-face the liability to glance off is reduced very appreciably. In rough work, such as laying floor-boards, building fences, and making packing-cases and crates, the possibility of the woodwork receiving the marks of the scoring is immaterial. The fact that this type of hammer has proved so conspicuously successful and safe should serve to prompt British manufacturers to introduce it to the market, especially as a hammer is often used by unskilled hands, and invariably with cheap nails, which are apt to fly, chip, or break when struck in the wrong way.

A DANISH DOCTOR ON FOOD VALUES.

Dr M. Hindhede, director of the laboratory for nutritive research of the Danish Government, has written a book, of which an English translation is published, entitled Protein and Nutrition: an Investigation (London: Ewart, Seymour, and Co.). He brings forward evidence supported by facts that the value of protein as a food has been much overrated, and that men as well as animals can live on half the amount prescribed and accepted as necessary by scientific authorities. From their own figures and experiments he claims to disprove the deductions of Vort, Attwater, Hutchinson, M'Kay, Chittenden, and other dietetic authorities. He founds on personal experiment and his own experience. Dr Hindhede, who is the son of a farmer in west Jutland, Denmark, was born in 1862. It was his observation of the wonderful working ability of the Jutland farmers which set him in opposition to the claims of the advocates of so-called strength-giving foods. He studied medicine with distinction, and settled down for twenty years amongst the west Jutland farmers as a doctor. Here he began to propagate his views as to the overrated value of protein in the feeding of milkcows, and recommended a smaller quantity of oilcake and more turnip fodder. His experiments led to his appointment at the head of a Government laboratory, with five assistants, exclusively for the study of human nutrition. Very little meat is eaten in his own home-some days none at all; and he brought up his children to eat plenty of oatmeal porridge, bread, and potatoes, and sparingly of meat and eggs. Good potatoes he calls a palatable and easily digested food. Some one said, 'The best recommendation of your ideas is that your children are so physically robust and mentally active.' He came to the conclusion, which was held by Dr Keith, whose Plea for a Simpler Life was discussed in these pages, that we are all more or less guilty of overeating, and that a vast number of common ailments are due to over-He says that a natural sense of health and well-being springs from his regimen, with a perfect appetite and pleasure in work. The moral of the book is that the richly albuminous food-stuffs are by far the most expensive, and that it is, therefore, sheer extravagance to squander the housekeeping money in a superabundance of protein unnecessary for body-building. Dr M. Hindhede is neither a vegetarian nor a foodfaddist, but approaches his subject from the scientific side. The vegetarian, however, will find a good deal of comfort in many of his conclusions.

DEADENING THE NOISE ON COBBLE-PAVED ROADS.

While the granite sett is a highly serviceable road material, it has the drawback of being extremely noisy. In Germany, where cobblepaving is common, a novel and completely effective means of diminishing the noise has been adopted. The spaces between the blocks are cleaned out for a depth of about one inch, and then asphalt is poured over the surface. The molten material enters and fills the spaces, and also forms a skin upon the top of the stones. The thickness of the coating may be varied as desired, but not more than an inch is necessary as a rule. Before the asphalt has cooled it is given a sprinkling of sand and its surface is smoothed. In this manner cobbles may be transformed into a carefully prepared asphalt roadway, deadening all noise, and presenting a surface which so far has proved to be extremely durable. The operation can be completed very quickly, so that there is very little interruption of traffic, and repairs can be carried out expeditiously and cheaply.

STREET-CLEANING BY ELECTRIC TRACTION.

The Aberdeen cleansing department, under the superintendentship of Mr Alexander Findlay, has introduced some interesting and useful devices for cleaning and watering the streets and removing snow by electric traction. For street-sweeping, two of the department's large rotary brushes are fitted on to the electric street car. One of the brushes is placed immediately behind the car

by means of a double stay attached to the drawbar of the brush. The second brush, which runs to the near side of the first one, is arranged in a more complex fashion by means of a bar which runs at right angles off the rear of the car, for the purpose of drawing and keeping it running straight, and is further controlled by a chain attached to the side of the bogie, and another chain back to the stay at the rear of the first brush. The full width that the brushes will sweep is fourteen feet, but this can be reduced, if necessary, to any width down to seven feet. The brushes were originally made for horse haulage; but the work is more expeditiously and thoroughly accomplished when they are attached to the street car in the manner described. The sweeping is done in the morning before the ordinary car service begins. The electric watering-car has a carrying capacity of two thousand gallons, and is fitted with Warwick's patent watersprinklers, two at each end of the car. The width of the spread of water is twenty-four feet, and the flow of water can be regulated so as to make it light or heavy, broad or narrow. The cost of streetwatering by electric traction is sevenpence per mile, an estimated saving being effected of one shilling and sixpence per hour as against watering by horse haulage. The method adopted to clear snow from the side of the rails is to fix a wing to the side of the car, which acts as a snow-plough, and in this way snow can be removed eight feet from the side of the outside rail. This works well with a light fall of snow, but in case of a heavy fall is not of so much use.

To Correspondents who wish fuller information regarding new inventions mentioned here, addresses will be furnished, when possible, provided a stamped and addressed envelope or post-card be sent to the Editor, 339 High Street, Edinburgh.

INVOCATION.

THE curiew peals no longer, yet ring down
Your star-sown curtain, Night, about us all;
Muffle the noisy drums of life that call;
Silence the garish clamour of the town.
Let us have respite for a while to drown
The tedious laughter of our carnival;
Let it be dark, to hide the tears that fall
From some sad worker or some unmasked clown.

We do not ask for pity, only sleep,
That we may meet the morrow brave and sane;
Deliver us from the relentless eyes
That watch all day and yet would pry again.
When courage, tired out, unarmoured lies,
Oh, make the silence safe, the darkness deep!
C. FARMAR.

* TO CONTRIBUTORS.

1st. All communications should be addressed 'To the Editor, 339 High Street, Edinburgh.'2nd. For its return in case of ineligibility, postage-stamps

should accompany every manuscript.

3rd. To secure their safe return if ineligible, ALL MANU-SCRIFTS, whether accompanied by a letter of advice or otherwise, should have the writer's Name and Address written upon them IN FULL.

4th. Poetical contributions should invariably be accompanied by a stamped and directed envelope.

THE TILERIES STACK.

By C. EDWARDES.

CHAPTER I.

JIMMIE BISHOP'S appearance in Hen Lane this May evening would have been a puzzle to certain Bidston minds, except on the one assumption that he had given up that London actress with whom he was now said to be in love, and had ascertained from Mary Ridley that she was willing to content herself with as much of his heart as the actress had left undamaged. Even then it argued him a bolder fellow than he was reckoned to be by Bidston folk who had known him as growing boy and young man. He might be making his fortune in London with —of all incredible tools!—his pen, and Mary might be as forgiving as the most exemplary of Christians; but what about Mary's father, Phineas?

Old Phineas the chimney-jack was a hard nut. More than twice in the last few months he had voiced his intentions, in the 'Tilers' Arms' and other free-speaking spots, of running up to London by a half-day excursion, and killing, or half-killing, Jimmie. This done, he would be back in Hen Lane at 4 A.M. the next morning, a satisfied father-and dash the consequences! There would not be much left in Mr James Bishop for simple Bidston to exult about when he (Phineas) had done with him. That Gaiety Theatre dancing-wench, or whatever she was, would never, after his interview with Phineas's fists, want to kiss him again. And as for his brains-if they were the part of him responsible for his printed tales—their sense, if not their substance, would be knocked silly for a long while to come. A little, sallow-faced whelp like Jimmie Bishop play the butterfly with his Mary's heart! Not much. Indeed, not at all, without suffering warmly for it. Jimmie Bishop, only son of the late Squint Bishop, a humble Bidston grocer with uncertain eyes, who had died bankrupt; and himself only a pound-a-week reporter on the Bidston News until his impudence and conceit egged him to London, where the devil had since prospered him!

Such was big Phineas's rating of the young man who proceeded, with a costly-looking small Gladstone bag in one hand and a new book in the other, from the Bidston railway station this agreeable May evening, and after a smiling 'How do, old chap?' to this and that tradesman at

the shop doors in the main street—there was nothing doing at that hour—reached the Chormley Arms Hotel, and went up its five broad steps with the ease of a first-class 'commercial.'

He carried himself and glanced about him as if it were a sort of private triumphal progress in his native place. But he stopped to talk to no one. His 'How do's?' were shed like royal favours. It was evidently just the same to him whether or not his saluted fellow-townsmen saluted in return.

His passing was almost an excitement in two or three quarters. For instance, there was Mr Perry, the tailor. In his 'newspaper' days Jimmie had composed several quite original 'front page' advertisements for Mr Perry, who now, having sighted him from his window, ran to his door and cried, 'It's never you, Mr Bishop, is it?' Jimmie waved his book, but answered the question no further.

Thereupon Mr Perry turned and met the scornful stare of Mr Griffin, the provision merchant. Mr Griffin's prompt shoulder-shrugs were as effective as an invitation, and Mr Perry joined him to exchange a few words.

'All there—that bounder!' commented Mr Griffin sourly.

'What did he say to you?' asked Mr Perry with friendly eagerness.

'He said, "Well, Griffin, how are you?" as if—took me in his stride—as if his miserable father hadn't welshed me out of thirty-five pounds odd. Confound his swank! Must be doing well for himself, if appearances count.'

'Just what I was thinking, Mr Griffin,' said the tailor. 'He's a snip of real Bond Street, from my point of view. Did you see the colour of his hat? Purple beaver! Some style about that. Fortune's wheel's an astonishing thing. I always thought him a clever chap. But I must be getting back.'

Mr Perry had glimpses of possible profit from Jimmie. On the other hand, Mr Griffin had none. But before the tailor was again by his window-pane fashion-plates Jimmie was disappearing under the colonnaded portico of Bidston's chief hotel, with Lord Chormley's heraldic arms in dusky scarlet and gold above it.

There was nothing in the least like 'swank' eserved.]

JANUARY 3, 1914.

No. 162.-Vol. IV.

[All Rights Reserved.]

about his behaviour in the hotel vestibule. 'I suppose I can be accommodated for the night?' he said in a plain, matter-of-fact way to the young lady official; and a maid was at once summoned to show him a first-floor room. It was a top-price room, furnished with every reasonable provincial luxury, and he took this also in his stride.

'It will do admirably, thank you, if the bed's a spring, as no doubt it is,' he said when the maid tarried as if for a remark. 'Dinner at seven, please.'

Then, however, he made a discovery.

'Be blessed,' he exclaimed to the dimpling girl, 'if it's not Minnie Dart! Here, shake, Minnie! Up to this healthy sort of athletic exercise nowadays, are you?'

As mites these two had attended the same Church school of St Stephen in Pigeon Street, played in the street together, contrasted chilblains and parents. Little more than this, but such memories cling.

'I'd not have known you but for your voice,' said the girl, evidently appreciating his graciousness.

'Not?' said he. 'Oh, that's rubbish! I'm not so changed, am I?'

'You're as different as light from dark, except

your voice,' she replied.

'Does that mean as different as good and as bad? I hope you don't mean that, Minnie. Let's look at myself.'

He gave the chambermaid's hand a parting squeeze and turned with a laugh to the dressing-table. But instead of viewing his own face and its perhaps most striking decoration—a shapely brown moustache with soaring ends—he gazed through the window, and exclaimed, 'Hello! what are they doing to the Tileries stack?'

Straight in front of him, a needle of brick and stone, with a gossamer frill of sticks at the summit, lifted some two hundred feet of its height above the opposite housetops about half a mile away. But for his rather absorbing emotions he could scarcely have missed noticing it in his walk from the railway station. It was a Bidston landmark for miles.

'They're repairing it,' the girl told him. Then a bell rang. 'And that's for me. I must go.'

'Just a moment!' he said, with an imperative note and a sudden air to match. 'How's every one? The Ridleys—are they all right?'

'I believe so, sir,' replied the girl, in her best chambermaid manner.

But Jimmie laughed at this also. 'Hang your "sirs"!' he said. 'It's Mr Ridley's job, I suppose, up there? My word! it must require some nerves. And yet—— Look here, Minnie, has anything been happening to them in Hen Lane?'

'Not that I know of,' answered the girl. But a second ring of the bell hurried her to the door. 'I shall get into trouble with Miss Lester. Dinner at seven, I think you said?' 'Seven or eight, I don't care which. Say halfpast seven.'

She nodded playfully and left him.

Alone, he consulted his watch, tossed the things out of his bag on to the bed, and began to pace the room. He made several turns up and down, frowning, but with interested eyes for the tall chimney whenever he turned in that direction. Then he stopped and wrote rapidly in a notebook; after which he made his toilet and went downstairs.

As it chanced, he was the only guest in the hotel that evening; but he was glad of it, and made more notes in his book between the soup and the fish, and the fish and the chops.

He was engaged with the chops when a blackbearded face peeped into the room, and then he was greeted, with contemplative mien, by Mr Westcott, the sub-editor of the Bidston newspaper.

'I heard you were down, Bishop,' said Mr Westcott. 'You are looking well. I'm glad to see you again.'

see you again.'

Jimmie reciprocated the gladness, and hoped

his old chief would join him at table.

But Mr Westcott could not do that.

'A couple of minutes' feast of the eyes is all the indulgence I can give myself to-night,' he said. 'To-morrow, perhaps, you will help us to a column or so for Saturday about a certain talented and rising young townsman. You're a scoop, Bishop, that we cannot afford to overlook.'

'Oh,' said Jimmy lightly, with a comely blush, 'that's all bosh, Mr Westcott. Besides, I'd rather not. I'm not at all a big gun yet. My stuff sells well enough, but it's got to be heaps better before I've any claim to a pedestal. You must let me off that, please. Do have a glass of wine or something.'

'Nothing, thank you.' The sub-editor put up his pince-nez. 'Excuse me, I want to have a better look at you. So you are not in Bidston for homage, admiration, and the round-eyed gaze of respectful envy! What, then, Bishop?'

They smiled together. A year ago Mr West-cott's habitual verbosity and dryness had seemed to Jimmie a fairly choice brand of humour. He didn't think much of it now.

'I want to freshen my local colour for a story, that's all,' he said. 'I'm returning to town to-morrow.'

'Indeed! Is that your programme, then?'

'It's the main item-yes.'

'The main item, Bishop!' The sub-editor rose with a grave expression. 'You're not married, are you!' he asked abruptly.

'Married, sir? Heaven forbid!' said Jimmie. But he coloured guiltily now. He saw what his old chief was driving at. Mr Westcott was deacon of the Hen Lane chapel, to which the Ridleys belonged.

'Well, my boy?' Mr Westcott said, gently prompting, yet with a certain judicial look in the eyes, as if he had a right to be inquisitorial.

He also laid a firm, almost as it were fatherly, hand upon Jimmie's shoulder.

'Well what?' muttered Jimmie, fidgeting under the pressure.

'What about Miss Ridley, Bishop?'

'Oh,' said Jimmie, seeming slightly annoyed, 'that's all over! I wrote and explained to her in November. I---- See here, Mr Westcott, you know as well as I do what a jealous old god literature is. Art and literature—they're both in the same stall. You've got to give your lifeblood to them if you mean to do anything worth doing. Greedy gods, both of 'em!' He seemed relieved after this little speech.

'You wrote to her in that strain?' suggested

Mr Westcott incredulously.

'More or less. I felt I had to, you know.

She was quite reasonable about it.'

'She would be,' said Mr Westcott very dryly. 'Poor fellow! If that's your attitude towards life and a most exceptional girl, you have my sympathy. I presume your stage friend has got

you fettered fast, eh?'

'Fettered fast!' cried Jimmie. 'My dear sir, nothing of the kind. I hope I'm consistent, whatever else I may be that's not so grand. Kitty Wing-that's her home name-she and I have each other's measure to the very barleycorn. She's just fodder for my inkpot, and knows it. She has no delusions in the matter. I give her a good time when she's on a loose end, and it's convenient to me, and she tells me some of the tricks of her trade for my pen's use. She 's capital experience, and not particularly expensive. Now you see, I hope, sir?

'Good heavens!' ejaculated Mr Westcott. He walked jerkily to the sideboard. 'As far

gone as that, are you, Bishop?'

'Far gone! What on earth do you mean? We've both got level heads, that's all about it. She's as decent a lassie as you could find.'

But Mr Westcott didn't wait for his testimonial about the London Kitty. 'I repeat that I'm sorry for you, Bishop,' he said, taking his hat. 'All I will add is—mind what you are about in Bidston. We're ordinary human beings here still, most of us, and I wouldn't be in your shoes for a trifle if they take you within reach of Mr Ridley's hand. But I don't suppose they will. Good-night.'

Jimmie started to his feet and flushed violently this time. 'I say, Mr Westcott!' he cried, as the sub-editor left the room. And then, 'Oh, very well, very well! See you to-morrow, I dare say. Old Puritan!' he muttered, smiling

uneasily, and returned to his dinner.

But the 'old Puritan' had given him food for reflection of more importance than the spoon-meat before him, and he was immediately busy with it.

A clock in the room told him that it was past eight, and he remembered that it was Thursday, and that from Mary's childhood she and her mother had attended the Thursday evening service at the Hen Lane chapel, whose ugly fivewindowed face sealed the south end of the street like a dead-wall. A vision of Phineas Ridley also came to him-the sandy-headed giant whose chin-beard, rough tongue, and habitual scowl he had already used with good dramatic effect in two or three of his stories. Imposing raw human material, this Phineas, when regarded artistically But although he believed and from a distance. he could afford to scoff at Mr Westcott's warning of personal danger in that quarter, he had no desire to meet Mary's father in the flesh. He entertained the vision very briefly therefore.

But Mary and her mother were different; and, as the upshot of his reflections about them, he declined the pudding course of his dinner and left the hotel hastily. A ruddy sunset was in progress outside; it suffused the unbeautiful little town with a romantic glow; also, it charmed Jimmie like a happy inspirationespecially at the Prince Street crossing, which showed him Rutton Ridge in the west and the Rutton Colliery's surface gear as if it were trying partially to eclipse the upper half of the red sinking sun.

'That's clipping!' he whispered, and stood

at the crossway until the sun had gone.

A little more and he reached the chapel at

the time of the final hymn.

It was an ordeal to pass the Ridleys' house in the street. He realised this to the full only when he had got by without any sudden opening of its door or other startling incident. But the

ordeal over, he smiled confidently.

He told himself that he was a fanciful idiot. Mary's influence over her father was nothing less than marvellous, and of course she had applied it to the old chap as soothing balm. had been so splendidly sensible in the matter of the November letter that Jimmie couldn't doubt her rare mind had worked likewise in her small home circle. He had asked for a post-card only of reply to his well-considered statement of the hard truth about the literary career—the jealous god idea was ripe in him even then; and her tranquil one line, 'It shall be as you wish, Jimmie,' was an immense encouragement to him then and thenceforward. She was a girl in a thousand, and a daughter in a million for a father like hers. Whatever Mr Ridley might think about him, he wouldn't dare to do any-Whatever Mr Ridley might thing to vex Mary

As for Mrs Ridley, Jimmie had wasted few thoughts upon her. Mary was the star and joy, and—in everything outside her kitchen and the

chapel—the trusted guide, of her aging life.

A narrow lane diverged between walls to the right of the chapel, and here he smoked a cigarette until the congregation came out.

He felt fairly comfortable in himself; eager, but not too eager, for Mary's pretty face, and reliant upon her established good sense to begin and end the meeting pleasantly for them both.

Again the mother didn't count. She was not refined, like Mary; but though she would probably show some perplexity about the situation, a reproachful word or two were the worst he expected of her.

But he was wrong about the mother.

A stampede of boys and girls from the chapel drew him towards it. Thirty or forty common-place adults in old-fashioned clothes followed, and then Mary and her mother. They were in deathly black from hat and bonnet downwards, and Jimmie's feelings were still so well under control that he could wonder what the black meant even while struck by Mary's beauty in association with it.

The mother saw him first. Mary was saying a smiling something to a neighbour woman, when Mrs Ridley plucked at her arm. Jimmie raised his purple hat, and then they met in the press at the foot of the steps.

Not a word from Mary at first. A little bloom in her rather pale cheeks, just the smile of perfect trust and understanding he could have wished for, and a warm answering grip of his hand

No excitement in either of them. A contented little nod—two or three nods—from Mary, as if she liked the look of him. And Jimmie evidently well pleased thus to see again his best friend in the world. He had told her in the letter that he hoped they would always be this to each other, 'first-rate pals, best friends,' &c.

But Mrs Ridley's excitement was unrestrained. She cried, 'Bless us all!' and 'Well, I declare!' fervently, before Jimmie gave her any attention; and burst into a 'Lor' sakes, Jimmie lad! it's a treat to see you again like this!' when he turned to her. She fumbled with his hand, and patted it, and reddened like the setting sun.

Jimmie's 'Well, Mrs Ridley, delighted to see

you looking so fit!' came with an effort.

Then Mary spoke and took control of things. 'Let's get out of this,' she said quietly, and led the way through the little throng of deeply concerned fellow-worshippers.

Jimmie and Mrs Ridley followed, Mrs Ridley continuing to hold him captive. The old lady's tenacity made him laugh at length. Even at such a time his artistic side could assert itself, and he saw the joke of her public treatment of

him as it might appear to a stranger.

But this state of mind soon ended. Before they were free of the others, Mrs Ridley was hailing him as a direct heavenly answer to prayer. 'I knowed you'd come, Jimmie. I axed for you on my knees in the second prayer, and I could have swore I saw your poor mother Emma's face with my eyes shut. "It'll be all right now, Jane," her said, or as good as said, with a happy smile. "The money'll put 'em both right. Don't you worrit yourself about things any more, Jane." That was what'—

And then Mary intervened again. She had

fallen back to them, and from Jimmie's other side shared with him this much of the old lady's artless prattle.

'Mother, don't be so soft!' she said forcibly, with a confidential smile for Jimmie as she bent and spoke across him. 'Money's nothing to

him.—Is it, Jimmie?'

'What's the matter? What has happened?' asked Jimmie awkwardly. He felt anything but comfortable now. Mary's charm was beginning to work in him as of old. And, on the other hand, every step took them nearer to Mary's home, which he did not propose to enter. Mrs Ridley's appeal to his curiosity, though strong at the time, was now of secondary importance.

Another moment and he felt something else—Mary's hand on his arm. 'Leave him to me, mother,' she said, checking a third explosion from the old lady.—'You won't care to come in, I expect, Jimmie, because father's there. But we might walk on a little way together.'

Weakness and confusion possessed him from head to foot in that moment. Mary's eyes were like smiling stars. Their serenity and beauty were not to be borne. He couldn't meet them. 'I'd better not,' he whispered. 'It was just a sort of impulse, my coming down. Well, partly, I mean. I didn't mean to call. I only wanted to know how you were.'

But this was too much for the old lady.

'What!' she boomed, wagging her bonnet indignantly; 'come to Bidston and not come to see us? Did you ever hear of such a thing? You ought to be ashamed to confess it, Jimmie Bishop.' She beamed again. 'But he don't know about your poor Uncle Silas, my dear, do he? Come along in to supper, and no more nonsense,' she added.

She waddled ahead of them; but, slipping her hand from Jimmie's arm, Mary caught her mother before she was at the door, and whispered earnestly to her. Only Mary's final words reached him: 'And you are not to tell father that we have seen him; you are not to, mother—not yet.'

She smiled at her mother's disappointed face, and next at Jimmie, whose emotions were of a much more complex kind. 'And go round to the back, there's a darling,' she said. 'I'll not be more than a very few minutes. Say "Goodnight" to him, and be good, mother dear.'

Mrs Ridley obeyed sighingly. 'It's no use talking, I suppose,' she said, as if exhausted.— 'Good-night, then, Jimmie; and be sure you come soon in the morning!'

His responsive 'Good-night' was as cheerful as he could make it, but unworthy of the purple hat he raised to the old lady.

And then he found himself as completely under Mary's control as the old lady herself.

'Now, Jimmie!' she said, with a compelling side-smile. 'It is nice to see you again. Such a swell you are, too! But never mind that. I

want to tell you about Uncle Silas. He died

suddenly on Tuesday!'

'Did he?' babbled Jimmie. He had already wished, and stifled the wish, that she would take his arm as before. He knew nothing about Phineas Ridley's brother Silas of Cinderbank except that he was a curmudgeonly old bachelor and tinware manufacturer in a small way.

'Yes; and father says he has left all his money to me. It's thousands of pounds, father says; and they both think that just because of this'—— She paused and seemed quite satisfied by his distressed stare at her. 'But you mustn't mind!' she continued soothingly. 'One has to remember that they belong to a different generation from ours, don't they—father and mother? You wouldn't believe how the thought of it has changed even dad about you. You ought to feel ever so proud, Jimmie; though I don't suppose you do. I've let them just think what they please so far; but—meeting you like that was so strange!'

Jimmie gasped and then spoke with a great effort. 'They thought because you've inherited

some money'

'Yes,' she said, with a sweet and gentle smile.
'Aren't they what you would call primitive?
But you mustn't look so worried. I quite under-

stand, and I admire you for it, Jimmie. It must be grand to love your work like that. Well, good-night, dear. That's all I wanted to say.'

She left him abruptly. And having looked after her until she had vanished into the early dusk of the street, he turned towards the hotel with his various disgusts and excitements.

But in fact it was as dark as a starlit night could be when he reached the 'Chormley Arms.' He wandered off down a side-street, and so into a road between pit-banks, and walked miles before his workaday senses urged him to the right-about. And they had all gone to bed except the boots when he rang the hotel bell for admission.

'Sorry I'm so late,' he said.

'Oh, that's all right, Mr Bishop!' retorted the boots cordially. 'I was reading one of your short tales, sir, that Miss Dart lent me—a ripper! I began to wonder, though. I didn't know what to think about you, sir.'

Jimmie took the candle that was ready for him, and laughed rather harshly. 'Nor I, for the matter of that,' he remarked.

And so to bed, with a continuing uncertainty on the subject.

(Continued on page 89).

OTHER DAYS AND OTHER WAYS.

IN this hurrying age, out of sight is too often out of mind. In what way, therefore, shall we hold the mirror up to nature, and view the faded panorama of the past, crowded with scenes and characters and incidents, links in the chain of human history? The historian, if he be concerned with kings and great men mainly, may fail in helping us to realise the life of the people. In biography, autobiography, letters, diaries, or journals we get a living picture of human nature, and incidentally get sidelights on the fashions, manners, and customs of the time. In these we come more closely in touch with the men who form the nation. The self-revelations in the diaries of Pepys and Evelyn, and the record of what they saw and experienced, make them priceless historical documents. We see the real Thomas Carlyle best in his own letters and Reminiscences. All the letters of R. L. Stevenson are more or less autobiographical. Every true narrative of events or picture of personalities has a certain historical interest—it is sometimes surprising to find how interesting. This is true of a volume before us, which is a pleasant record of a varied life spent at home and abroad, episodes in which the writer sets down with more than usual literary charm.

Mr A. G. Bradley—whose book, *The Gateway of Scotland*, was noticed here under the title, 'On the Skirts of the Lammermoors' (1913)—

has had a varied and unique experience in Great Britain, Canada, and the United States. What he has written of an autobiographical nature, the setting down of actual experience, is both entertaining and instructive. He looks outward on the world in a cheery, optimistic way. His Other Days: Recollections of Rural England and Old Virginia (Constable), contains many family recollections. There is a lifelike sketch of his father, the Rev. G. G. Bradley, who had a distinguished career as house-master at Rugby, head-master of Marlborough, Master of University College, Oxford, and Dean of Westminster. He thought Tom Brown's Schooldays a good boys' story, but one that failed to touch the more intellectual side of school life. The author created his heroes simply as types. Bradley's term of office at Marlborough was distinguished for good management, increase in numbers, and removal of debt on the school. Tennyson sent his son Hallam not to Marlborough but 'to Bradley;' and in the Isle of Wight, where they were near neighbours, the two families were very friendly. Mr A. G. Bradley claims to be the only person living, save one—is it Lord Tennyson? -who played with the poet in a football match. The poet and the elder Bradley were looking on, when they seemed to be seized with some 'sudden fires of youth,' and, divesting themselves of cloak and coat, they played vigorously for

about ten minutes. When a guest of Bradley at Marlborough, Tennyson would read aloud his 'Northern Farmer' or some passages of his own or other poetry in 'deep-chested, deliberate tones.' Reading, he held, should be slow and deliberate. Sometimes Tennyson, left alone with the masters after Bradley had gone to bed, would light a long churchwarden, and discuss his favourite topics until the morning hours. One day, at the home of Arnold of Rugby at Foxhow, an elderly man of florid face and plain attire walked through the French window and asked Bradley if the Doctor was about. This was Wordsworth, who looked just like a well-to-do farmer. The elder Bradley regarded long-distance running as of doubtful advantage to boys. In consequence of overrunning himself at Rugby he showed a marked delicacy through life. Some great events while he was Dean of Westminster were the Jubilee Services of Queen Victoria and the Coronation of Edward the Seventh; while the great burials of his time were those of Darwin, Browning, and his friend Tennyson. His own grave in the Abbey is in the south aisle of the nave, near the tomb of Atterbury.

The paternal grandfather of the author of Other Days was the Rev. Charles Bradley, who was twice married, and left twenty-one children. His published sermons had a very wide circulation; according to the late Alexander Macmillan. they had the second largest circulation of sermons known to the trade, and he 'exercised forty years of pulpit eloquence.' The church of St James', Clapham, was built especially for him by his future congregation while he was still at Glasbury. Mr Bradley's maternal grandfather, Archdeacon Philpots, had seventeen children, lived to be ninety-nine, and died in 1889, having retained his faculties to the last. One of his foreign tours was to Turkey when he was close on eighty years of age. He had a marvellous memory, his grandson tells us, and delighted to talk of old times, 'relating just the kind of things that one likes to hear about, and that books fail to tell us.' Genial and lovable, he had not an enemy. Some impressions of his set down in writing after attending a levee of George the Fourth are still unpublished. He was in Edinburgh, during his honeymoon, when that king was being fêted, and was so delighted with the place and its society that he and his wife stayed there for nearly a year. They lodged in George Street, and met all kinds of people, including Walter Scott and his wife, regarding whom he left original comments. He also enjoyed some grouse-shooting on the Lammermoors, a region which his grandson has made known to many Southerners.

What would many youths, too young for Marlborough and needing individual attention, give for Mr A. G. Bradley's opportunities for sport and study when sent to a rectory in Devon, twelve miles from the nearest railway at

Barnstaple? On Exmoor he entered upon what was to prove for him an earthly paradise. He thinks it most unlikely that anywhere else in England was there such a prospect associated with a private tutor. The rector was a muscular Christian gentleman and sportsman, certain to give his pupils sound and sane views of life. He was an excellent shot and fisherman, and a fearless rider. The Georgics appealed to his pupil more freshly when read at an open window, and he felt the influence of the scenery most keenly. Between the call of study and the call of the wild there was not much time for general reading, yet he devoured a large-print edition of the Waverley Novels and the new volumes of Macaulay's History, besides enriching his imagination by the study of some of the best poetry. 'There was practically no cheap trash in those days to fuddle the brains of such as hadn't many, and tempt those better endowed to mental debauchery, nor picture magazines clad in garish raiment to cater for passing amusement of the weak-headed and half-educated.' No local person knew of the Doone Valley until Blackmore made it famous in his Lorna Doone.

We can follow Bradley as he began farming in East Lothian after leaving Cambridge; thence he proceeded to Aberdeen, Wiltshire, and then to Canada and the United States. A better picture of its kind was never written than his paper on 'East Lothian in the Seventies.' The tenantry he describes as in the van of agricultural progress. He notes that 'all the importance, the substance, the power, the serene, invulnerable prosperity of old days has gone, or is obviously going, for good or ill. The prestige as it then existed, not merely that of landowners but of farmers, as recognised leaders of the world's agriculture has vanished.' secret of the importation of so much agricultural produce from Denmark and elsewhere, and our own higher prices for some commodities, lies in the 'undreamed-of self-denial in food, raiment, and amusement' of the foreign producer. The farmers of East Lothian enjoyed themselves socially, had little dances, played golf, indulged in curling and coursing, and paid frequent visits to Haddington or Edinburgh. North Berwick and Gullane had not risen to their present eminence as golfing or health resorts. Young Bradley moved for a time to the red lands near Dunbar, and had also experience on a sheep-farm on the slopes of the Lammermoors, amongst the shepherds, 'a race of men unsurpassed of their kind in the island of Britain.' East Lothian was then, he thinks, the best-farmed county in the world. It is to-day as good as ever, though rents and prices have fallen.

He had a strong topographical bent, and enjoyed what he saw. 'The first morning that for me broke over East Lothian revealed at a glance, from my bedroom window, about half its bounds, and a good deal outside of them.

Arthur's Seat and the Pentlands, with the dim smoke-cloud of Edinburgh, lay twenty miles away across the flat Lothian plain that fringed the Firth of Forth. For thirty or forty miles along the horizon, upon the inland side, rolled the billowy solitudes of the Lammermoors. Between the moorlands and the shore lay the clear, trim undulations of the then world-famous county. Beyond the gradually expanding sea, otherwise the Firth of Forth, for another score or two of miles ran the level coast and lofty back-lying hills of Fife. The triumphs of agriculture, prosaic, material, if you like, were set nevertheless in a frame that embodied half the romance of Scottish history.' In the secluded wilds of Exmoor, as we have said, Bradley had read the Waverley Novels, and he was now gratified to find himself close to the scene of one of his favourite stories, The Bride of Lammermoor. For the prosaic and more poverty-stricken side of East Lothian life at the beginning of last century -a surprising contrast-reference may be made to The Autobiography of a Working Man, by Alexander Somerville. Bradley remarks that the Lothian hind managed to clothe and nourish himself and family on a surprisingly low wage. Farmers in the Lothians at that time paid nearly double the rent obtained for similar land in Norfolk, Hampshire, or Lincoln. The year 1879, a disastrous year meteorologically, Bradley considers marked the beginning of the decline of British agricultural interests.

The wild, silent, shaggy land of Canada completely fascinated Bradley, although he thought the mean whites of the United States almost gentlemen compared with the shanty-men in the Canadian forests, whose volumes of senseless and filthy blasphemy and elaborate imprecations were appalling. Later he enjoyed ten years in Virginia; and the best things in his book are realistic and humorous sketches of 'The Doctor and the Colonel,' 'The Poor Whites of the Mountains,' and 'Mar'se Dabs after the War.' He has photographed here a good deal of the white and negro life which has quite passed away.

Mr Bradley says that there is no glamour about the Ontario farmhouse now; impatience is shown by the sons and daughters, with their narrow, joyless, toilsome lives of twelve and fourteen hours a day. The wives have to do all the cooking, washing, and housework, and The rôle of an indoor help is unprocurable. Ontario farmer can only be played by men to the manner born. A man with two thousand pounds might, he thinks, use his capital and energy to better purpose on a large farm at 'Not one educated Englishman in ten thousand,' says our author, 'realises that English Canada was originally a great military colony; that it was founded by the irregular regiments that had fought through a long and cruel war, and that the officers of these regiments, to a great extent, provided in themselves and their children the political leaders—nay, almost the political autocrats—of the colony for fifty years. Nearly everybody I know seems to think that Canada was founded higgledy-piggledy by relays of British emigrants, like New Zealand.' To read this is a corrective to one-sided descriptions which aim only at attracting the emigrant. To-day we are told an annexationist (with America) is hardly to be found.

It is curious to turn from the above to an older narrative, that of Louisa Twining, who did excellent philanthropic work in London last century, and who in her Recollections of Life and Work gives a striking picture of the contrasts between the old ways and the new. Nowhere is this more apparent to her than in the condition of children and the enjoyment of travel. There is a revolution in the life of children, who are found not in the nursery, but in the dwelling-rooms of their elders, and who travel earlier. Every stage of life is forestalled, and children are dragged into scenes and pleasures which can only be fitly appreciated at a later period. Miss Twining's own early days were quiet and uneventful, free from excitement, and passed in a steady round of occupation. Three months of every summer were spent in the country; and she has left records of delightful posting tours through rural England and over the Continent, such as John Ruskin enjoyed with his father. She neither went to school nor had a governess. Her mother, who was also educated at home, taught the elder girls, and they instructed the younger children. Masters supplemented this in later years. With an insatiable love of knowledge, she avoided the mistake of ever thinking her education finished. She went on learning singing, dancing, and drawing, and attended lectures at the Royal Institution. Her father, a business man in the Strand, dined at 6 P.M., and often went back to business afterwards. He would read aloud to his children from Shakespeare's plays or from other good authors. With him an enjoyable visit might be made to Covent Garden before breakfast. Louisa had always some good book on hand; Arnold's sermons was one of them, as she had two brothers under that great educationist at Rugby.

In winter less was thought of warm clothing as a protection than is the case now, and woollen clothing was seldom worn. Linen was much in evidence. Three meals a day was the allowance for children. Samplers were universal performances; at six Louisa worked one in cross-stitch, with an alphabet and numerals, and such mottoes as 'A stitch in time saves nine.' In a finer sampler, sewn when she was eight, one motto was, 'After labour rest is sweet.' She derived intense enjoyment from this needlework, and questions if anything to-day is more useful and pleasant. Up to 1836 she had seen, besides orreries and dioramas, fourteen panoramas, from

which she learned what the cinema is teaching many to-day of geography and travel. The Surrey Zoological Gardens, in which giraffes were first seen in 1836, were a treat to young people. Acting French plays was a favourite amusement. While she was struggling to acquire ease in composition, the only advice ever given to her was to read the leading articles in the *Times* and study their composition, and use the shortest and plainest words and short sentences. The postman, with his red coat and bell, who both gave and received letters in the absence of post-pillars and letter-boxes, and the advent of envelopes and matches, receive attention.

She asks if the young folks of this generation realise the hardships endured in travelling by coach. The journey from Rugby to London occupied from 7 a.m. till 6 p.m. The hackney-coaches were of a most miserable description. In a ride in the mail from London to Bitteswell in Leicestershire, she recalled the huge letter-bags being swung on to the coach, and how they did not have lights until they had left Barnet. After leaving Woburn, when it was quite dark, she settled herself in the corner to sleep; but the tremendous pace of the coach prevented her doing so. She was frightened at feeling the coach swinging about from side to side of the road, but grew used to this, although she liked

it still less when daylight came. The sun arose before they arrived at Northampton, and when they stopped a moment to chain the wheel she Bitteswell was reached heard a nightingale. before six in the morning. About eleven she went to sleep till near three, when they dined. On 2nd June 1838 she began her first railway journey, to be followed by fifty years of such travel over thousands of miles. It was from Euston to Berkhampstead on the North-Western line. The motion disappointed her, and the shaking exceeded anything felt in the coach. The enjoyment was lessened by frequent stops, and the passage through three tunnels in total darkness, as the lamp in the carriage had gone out. 'It is certainly as trange sensation, rushing on at so tremendous a pace, and with so great a noise, into the darkness, and appears to me to show the confidence people place in this wondrous power more than anything. The coldness of the air as you rush through is disagreeable. The journey of twenty-seven miles occupied an hour and a quarter, 'and the time had seemed so short that I was quite sorry when it was over.' She notices that rush and distance now seem to be considered necessary elements in modern life. Mr Bradley tells how an old dame, on first encountering a railroad in Devon, came back to say that the train, having 'given a yell at the sight of her, dashed into its hole' (a tunnel).

A KNIGHT ON WHEELS.

By IAN HAY, Author of The Right Stuff, A Man's Man, Happy-go-Lucky, &c.

CHAPTER V .- MISTAKEN IDENTITY.

UNCLE JOSEPH had an adventure in town which amused him immensely.

The International Brotherhood of Kind Young Hearts, it may be remembered, radiated its appeals from within the precincts of Pontifex Mansions, Shaftesbury Avenue. It was quite a good address, but, like many of the good things

of this world, looked best on paper.

The Kind Young Hearts rented a small officeflat at the top of a block of rather out-of-date buildings in the neighbourhood of Dean Street. The flat was uninhabited, and contained not a particle of furniture of any description except a capacious letter-box; but these deficiencies, which might have roused unworthy suspicions in the breasts of some of the more worldly of Uncle Joseph's supporters, were covered by the fact that the door was double-locked, and no subscriber had ever entered the premises. On the door itself the name of the society was painted in neat black letters. Underneath was pinned a typewritten notice—of an apparently temporary character, but in reality as enduring as Uncle Joseph's tenancy—to the effect that the secretary had been called away to the country on an urgent case, but hoped to return shortly.

It was Uncle Joseph's custom to make a periodical inspection of this establishment, though he left to James Nimmo the task of making the weekly collection of letters. On this occasion all seemed in order. No restive subscriber waited on the landing; no emissary of the law, masquerading as a star-gazer, lounged in the street outside; no one had tampered with the Chubb lock on the door; no one had scribbled opprobrious comments across the secretary's notice. All was peace.

Uncle Joseph entered the flat. The box contained half-a-dozen letters, which he opened and

read in the dusty sunlight of the office.

Meanwhile Mr Charles Turner, junior member of the editorial staff of *The Searchlight*, was mounting the staircase with all the headlong eagerness of a young and inexperienced foxterrier in pursuit of his first rat. He took himself seriously, did Turner; which was a pity, for a touch of humour is indispensable to a man whose profession it is to expose humbugs. Dill, his chief, possessed this quality in perfection,

with a strong dash of cynicism thrown in. Dill knew that righteous wrath was wasted upon the tribe of quacks and sharpers. He never invoked the assistance of the law against such gentry. He preferred the infinitely more amusing plan of exposing their methods in cold print, and leaving it to them to invoke the assistance of the law against him. Consequently his name was a hissing and an abomination among all the fraternity; while the British Public, though strongly suspicious of Dill's sense of humour, took in, read, and profited by The Searchlight in general and its Rogues' Catalogue in particular.

The Searchlight was unique. There were other organs which made a speciality of exposing quackery; but these could seldom resist the temptation of endeavouring—usually successfully —to blackmail the quack as an alternative to exposing him. But The Searchlight was above suspicion. It had never attempted to run with the hare and hunt with the hounds, for the excellent reason that such a proceeding would have bored its proprietor. Dill harried the unjust, not from any special feeling of tenderness toward the just, but in order to gratify his own rather impish sense of humour. He had no special regard for the feelings or pocket of the British Public, but he loved to clap an impostor in the pillory and watch him squirm.

This was the seventh visit of the zealous Turner to the headquarters of the Kind Young Hearts. He had missed James Nimmo on the previous Thursday, for that astute emissary always made his call for the letters about eight o'clock in the morning; so Turner was still without evidence as to whether the flat was in use at all.

His gratification, then, on beholding the door He peeped inside. standing open was extreme. Standing by the window of the bare and dusty room he beheld a middle-aged, military-looking delivered into his hands. He tapped at the door and walked in.

Uncle Joseph, looking up from the last letter, gave Mr Turner a polite good-morning. sleuth-hound replied in suitable terms, and embarked upon a tactful yet deadly cross-examina-tion, long laid up in readiness for such an

opportunity as this.
'I have called,' he began, 'in reference to a circular which you sent me a few days ago.'

'Did I?' replied Uncle Joseph blandly.

'Yes. It was an appeal for funds for the International Brotherhood of Kind Young Hearts.

'This is most interesting,' said Uncle Joseph, putting his letters back into their envelopes. 'But tell me, how do you know that it was I who sent you a circular; and why have you tracked me to an empty flat in Soho to talk to me about it?

'Aren't these the offices of the Brotherhood of Kind Young Hearts?' asked Turner, a little abashed.

Uncle Joseph smiled indulgently, and looked round him. 'They don't look very like the offices of a charitable organisation,' he said, 'do they? Charity begins at home, you know. That being the case, I rather fancy your kind-hearted friends would at least have furnished themselves with something to sit down on.'

But Turner, although he was young and inexperienced, was no fool. Otherwise he would not have been upon the staff of The Searchlight.

'Charitable organisations sometimes employ accommodation addresses,' he said, regarding Uncle Joseph keenly; 'especially when they are not quite—you see?'

Uncle Joseph nodded comprehendingly. 'Yes,' he answered, 'I see. Well, Mr-I don't think I caught your name?'

Turner.

'Thank you. Well, Mr Turner, accommodstion address or not, I am afraid your birds are You will have to seek them in some other eyrie. You see, I have been in possession of this flat for some few days now. In fact, several letters have already been addressed to me here.'

He held out the little bundle of envelopes in such a way that Mr Turner found it quite impossible to read the addresses, and then put them back into his pocket.

'I must have the name on that door painted out,' continued Uncle Joseph briskly, 'or I may have more investigators descending upon me. Not that I am anything but delighted to make your acquaintance, Mr'

'Are you quite sure,' said Turner steadily, 'that you are not the secretary of the organisation whose name is painted on that door?

Uncle Joseph laughed easily. 'Under this impressive cross-examination,' he said, 'I know I shall presently feel quite certain that I am! Mr Turner, you fill me with guilty apprehensions. It is a great gift of yours. May I ask if you are a representative of the law? Or are you the emissary of some newspaper? Or are you merely taking up detection as a hobby ?'

Turner flushed. He felt certain that he was being bluffed, but Uncle Joseph would give him no opening. 'I represent The Searchlight,' he said.

'In that case,' said Uncle Joseph cheerfully, 'I shall be delighted to offer you a lift back to the office. I am going to call on Mr Dill at twelve o'clock. Come downstairs, and let us see if we can get a cab anywhere.'

He locked the door of the flat, and proceeded cheerfully down the staircase, followed by the

dazed Mr Turner.

Ten minutes later Uncle Joseph was shaking hands with Dill. 'I have just had a narrow escape of being haled to justice by one of your bright young men,' he said, and recounted his adventure.

Dill, lying back in his chair and smoking a cigarette—it was said that he got through a box

a day—heard the story, and chuckled.

'An unlucky coincidence for Turner,' he said. 'Still, he is all right. He is young, and wants a bit more savvy; but he is a glutton for work, and as plucky as they make them. I always send him where I think there is a likelihood of any chucking-out being attempted. I am quite at sea about this Kind Heart business. It is evidently a biggish affair, with a big man behind it. I can't make out whether he is an old friend or a new candidate for the Rogues' Catalogue altogether. But I'll nab him yet. Have another cigarette?'

'How are your Christmas charities going?'

inquired Uncle Joseph, helping himself.

Not too well, said Dill. In the old days things were simple enough. I asked for the

money and I got it. Now the public are bled white, either by knaves like this fellow who runs the Kind Hearts, or a parcel of incompetent, sentimental old women who waste one-half of what they get on expenses and the other half on pauperisation. I have had a deficit each year for three years now.'

Uncle Joseph took out a pocket-book, and counted out twenty five-pound notes. 'I can run to a little more this year,' he said. 'Here you are—fifty for the free dinners and fifty for the toy distribution. Anonymous, of course, as usual.'

Dill gathered up the money. 'Meldrum,' he said—and his voice sounded less like a raven's than usual—'you are a white man! I say no more.'

'Good-morning,' said Uncle Joseph.

THE RHINOCEROS IN SIBERIA.

By the Rev. D. GATH WHITLEY.

THAT the rhinoceros should have lived not long ago in Siberia, and that it should have existed in that dreary region in vast numbers down to a comparatively recent time, seems to be utterly opposed to all our notions of natural history.

The rhinoceros is at present confined to the warmer regions of Asia and Africa, and is a native of tropical countries only; it is found in the hot, steaming jungles which fringe the lower slopes of the Himalayas, and in the hottest portion of Java and Sumatra it makes its home in the forests and amidst the morasses. Africa is particularly its headquarters, and in the Dark Continent it is found in great numbers and in several species. Notwithstanding the onslaughts of European sportsmen, it still exists in many places south of the Zambesi; and between that river and Abyssinia, and right up to the southern limit of the Sahara, it is everywhere met with—on the plains, in the valleys, and amidst the forests.

That such an animal, which now exists only in India and in Africa, should have lived recently in so cold and inhospitable a region as Northern Siberia almost surpasses the most extreme credulity. Such, nevertheless, is the fact; and the account of the discovery of the remains of the rhinoceros in Siberia, and the explanation of the manner in which they were entombed, is one of the strangest chapters in the book of physical science.

The forest region of Central Siberia extends without a break from the Urals to the Sea of Okhotsk; and while it extends southward to 58 degrees north latitude, it reaches to the north in an unbroken mass considerably beyond the Arctic Circle. It is a vast wilderness of dark

and gloomy forest, in which the pine, the larch, and the cedar flourish in unchecked luxuriance; while beneath their gloomy shade a tangled underwood of shrubs and plants forms a dense and impenetrable thicket, and affords shelter to the bear, the fox, and the wolf. Human habitations are few in this tangled wilderness, roads there are none, and only a few tracks lead the furhunters through the endless solitudes. Northward the forests become less dense; the swampy valleys, often occupied by lonely lakes, open out; and the hillsides are clothed with straggling clumps of larch, which are smaller and thinner as the traveller advances northward. At length the trees disappear, the forests are wholly left behind, and immense plains without trees or bushes stretch in desolate and endless monotony to the icy shores of the Arctic Ocean.

In 1771 some native Siberians, belonging to the Yakut race, were engaged in hunting on the banks of the river Vilui, which falls into the Lena in latitude 64 degrees north, about two hundred miles north of Yakutsk. The country on the banks of the Vilui is mountainous, and the hills are covered with dense forests, which are frequented by bears and wolves. As the Yakuts were wandering along the river valley they were struck by the strange appearance of a low hillock of gravel which rose close to the river's bank, and on examining it an extraordinary sight was disclosed to their astonished gaze. The body of a monstrous rhinoceros, lying on its side, and covered with thick masses of hair in scattered patches, lay half-buried in the sand and gravel. We may well imagine with what amazement and superstitious fear the wild hunters of the Siberian wilderness gazed at the body of the huge beast, which was so different from that of any animal with which they were acquainted. Strange stories were told amongst the native Siberians of monstrous and unknown animals which lived in the depths of the earth. It was rumoured that great beasts inhabited gloomy caverns underground, and came forth only at night; that these monsters frequented the shores of the icy sea, and fed on the dead bodies which were washed up by the waves; and that it was certain death to meet them unless the discoverer could sacrifice a reindeer to the demons.

A Russian officer reached the spot some time after the discovery, but by that time the carcass had partially decayed. He found that the body of the rhinoceros was lying on its right side. The flesh was in a very fair state of preservation, and was covered with skin which resembled tanned leather; and even the eyelids had escaped decay. The body was covered with bunches of stiff, bristly hair, and these were particularly thick around the feet. The animal when living had two horns, but these were both gone when the body was found, although traces of them were visible in their proper positions. The soil in the valley of the Vilui is perpetually frozen from a few feet below the surface to an unknown depth, and in this frozen gravel and sand the remains of the rhinoceros had been preserved until an unusually hot summer had thawed a portion of the gravelly soil in which the carcass was entombed, and had caused it to fall down on the bank of the river. The head and feet were cut off and carried away, and the remains were then left to decay

The celebrated naturalist Pallas, in 1772, reached Irkutsk, the capital of Eastern Siberia, and examined the remains. He was struck with their excellent preservation in the frozen soil, and was also impressed by the amount of hair found on the head and feet, which so clearly distinguished the animal from the Indian or African rhinoceros. Ultimately those portions of the animal which had been detached from the body were brought to St Petersburg and deposited in the Zoological Museum, and they have since been thoroughly described by Professor Brandt.

Since 1771 many more remains of the rhinoceros have been discovered in Siberia, most of them belonging to the same hairy species, which, from the peculiarity of the partition between its nostrils, has received the scientific name of Rhinoceros tichorhinus.

The Siberian rhinoceros was much larger than those of Africa or India, and was even more bulky and clumsy. Its head was also somewhat different, as it was very long and low, and its two horns were of great size. The long muzzle of the animal has in the skeleton a strange bird-like appearance, and evidently belonged to a species of rhinoceros which was particularly a tree-feeder. But the main characteristic of the

Siberian rhinoceros was the thick masses of hair it possessed, which gave it an appearance quite different from that of any rhinoceros now living, and from the presence of which it has been called 'the woolly rhinoceros.' In ancient times this animal was not confined to Siberia, but wandered over much of northern Europe, for its remains have been found in Germany, France, and Great Britain; but Siberia was its special home, where it existed in large numbers. In northern Europe no doubt primitive man gazed with fear and astonishment on the vast bulk and strange form of this hairy monster which he did not venture to attack; but man does not seem to have penetrated into the solitudes of Siberia when the woolly rhinoceros ranged its grassy plains and traversed its dense forests.

The discovery of the body of the hairy rhinoceros in a good state of preservation on the banks of the Vilui necessarily leads to many inquiries, and we ask, could the rhinoceros ever have lived in the cold and wintry region in which the Yakuts discovered its carcass? Pallas fancied that it lived far to the south, and that it was washed northward at the time of Noah's Flood; and others have maintained that it lived in warmer regions, and that it was swept northward by the currents of the rivers. These explanations, however, cannot be accepted. The rhinoceros was found on the banks of the Vilui, a river which does not flow from south to north, but from west to east, and has its whole course in the cold portions of Siberia, where the ground is perpetually frozen. Nor can we escape from this difficulty by supposing that the body was drifted down the Lena, which flows from south to north, and that local floods carried it into the valley of the Vilui, for similar difficulties beset this solution of the problem. The Lena rises in the south of Eastern Siberia, north of Lake Baikal, and does not in its course approach any warm region; in fact, the climate of the country where it rises is almost as cold as that of the region through which the Vilui flows. More than this, had the body of the rhinoceros been washed for hundreds of miles down the rivers before being finally stranded on the sandbank in which it was discovered, it would have been bruised and decayed, whereas it was almost in a complete state of preservation when found. We cannot avoid the conclusion that the rhinoceros lived in former times in Central Siberia, and that it had its home in the forests on the banks of the Vilui, near the spot where the Yakuts discovered its body in the sandbank.

But how did the rhinoceros die?—for dead it was, and dead it had been long before the hunting party found it lying in the gravel and sand near the Vilui. It could not have died from disease, for its body was well nourished, and death had evidently overtaken it in the full possession of its powers. No gradual decay

and no slow change of climate, moreover, could have brought about its death, for it has been proved that it fed on the same vegetation that now grows in the valley of the Vilui, so that it had plenty of food at the time of its death. Besides this, we must remember that its body was preserved by being frozen up in a bank of icy gravel; and from the day when it was frozen into the gravel the surrounding soil was never once thawed until it fell on the saudbank where the Yakuts found it. Had the body been subject to constant thawings in summer and freezings in winter the flesh would soon have completely decayed, and bears and wolves would speedily have devoured the carcass. We know that this would certainly have happened; for when, some time later, the body of a mammoth fell out of an icy bank near the mouth of the Lena, wolves and bears assembled in great numbers and enjoyed a grand feast on the body of the huge fur-clad elephant. They would also have speedily devoured the carcass of the rhinoceros of the Vilui had it not been frozen; but when discovered it was perfect, which proved that it had never been thawed since the day of the animal's death. Nor can we say that the rhinoceros wandered into a treacherous bog, and, sinking slowly by its ponderous weight, was mired, and gradually starved to death; for the rhinoceros was not on boggy ground when discovered, but on firm gravel and sand.

The animal appears to have been drowned, for the blood-vessels of the head were found by Professor Brandt to be filled with red coagulated blood, such as would be produced by suffocation through drowning. Probably it was suddenly caught in a flood of rushing water from which it had no opportunity to escape. At one moment the animal was standing on firm ground peacefully browsing, and in the next was overwhelmed by a roaring flood, the tumultuous waves of which bore along masses of mud and gravel in their sweeping course, so that it was drowned and buried almost instantly. Then an intense cold set in, the body was frozen up, and the ground was never thawed until the day when it fell down on the banks of the river.

In 1877 the body of another rhinoceros was found on the banks of a small stream which flows into the Yana, in North-Eastern Siberia, about one hundred and fifty miles north of the little Russian settlement of Verkoyansk. This discovery took place within the Arctic Circle, in latitude 69 degrees north and longitude 133 degrees west, a far colder and more dreary region than that of the Vilui. The valley of the Yana, in which the body of this rhinoceros was found, in the region of the greatest cold in the world. At Verkoyansk, on the Yana, one hundred and fifty miles south of the spot where the body of the rhinoceros was found, the thermometer in winter sometimes sinks to 90 degrees Fahrenheit below

zero, and the average temperature of January—which is the coldest month of the year—at this dreary place is 63 degrees Fahrenheit below zero; but in its lower course the Yana freezes in the beginning of September, and its surface is not thawed until the end of May. That the rhinoceros should have lived in this intensely cold region is truly surprising.

The head and one foot of the rhinoceros of the Yana—the Rhinoceros merkii of sciencewere cut off and sent to Irkutsk; but the body was washed away by the river. From an examination of the remains it was found that the rhinoceros of the Yana was of a different species from that of the Vilui. The rhinoceros of the Vilui was a huge, clumsy, and hairy beast. The Yana specimen was more slender; it bore two horns, and closely resembled the rhinoceros of Sumatra, which is more timid and inoffensive than the pugnacious genus in Africa. rhinoceros of the Vilui, the rhinoceros of the Yana seems to have died from drowning, as the mouth and one of the nostrils appear to have been wide open when the body was discovered. Here, then, we have proof not merely that these animals lived not very long ago in what is now the coldest portion of Siberia, but also that there were at least two distinct species then existing in Siberia.

Besides the bodies of rhinoceros, other remains of these great beasts are frequently found in Siberia, their bones and skulls being met with in all parts of the country. In the Ural Mountains the skeletons are abundant, and are often discovered during the mining operations extensively carried on in the mountains. Far to the south, also, in the heart of the great range of the Altai, there are many caverns in which the bones of buried animals are occasionally brought to light; and amongst these remains are the bones of the rhinoceros, proving that these great beasts wandered amongst the forests, and slaked their thirst at the lakes which exist in such numbers in these mountains. Nor are the remains of the rhinoceros less abundant in Eastern Siberia. Pallas found the cranium of a rhinoceros, more perfect than that from Vilui, near Lake Baikal; also, in the neighbourhood of Irkutsk and along the lower course of the Yana, as far north as the place where that river falls into the Arctic Ocean, remains of the rhinoceros are often discovered: and many of their bones found in the vicinity of Irkutsk may now be seen in one of the museums of that city.

But the most extraordinary places in which the remains of the rhinoceros have been found in Siberia are the Liakoff and New Siberian Islands, in the Arctic Ocean to the north-east of the mouth of the Lena. The Liakoff Islands are scarcely fifty miles from the shore; but the New Siberian Islands are in latitude 75 degrees north and longitude 140 degrees east, two hundred miles distant from the mainland. These dreary islands,

on which there are neither trees, shrubs, nor grass, and which are covered with snow and plunged in darkness during a considerable portion of the year, are literally teeming with the remains of rhinoceros, elephants, and buffaloes. The skeletons of rhinoceros found in these desolate, icy islands show that vast herds of the great beasts must have lived and died there when the climate was warmer than it is An account of the discovery of these islands is given in Wrangell's Siberia and the Polar Sea.

A glance at a map will show that, as the bones of the rhinoceros have been found in Siberia as far north as the New Siberian Islands, as far south as the Altai Mountains, as far west as the Urals, and as far east as the river Yana in 135 degrees east longitude, it follows that the rhinoceros formerly roamed over the whole of Siberia, and was not confined to a particular district. Rhinoceros tichorhinus also lived in northern Europe, as well as Rhinoceros merkii; but Siberia was the headquarters and special

home of this great hairy giant of primeval days.

The singular form of the cranium of the hairy rhinoceros, together with its hooked muzzle and enormous horns, has given rise to many strange traditions amongst the wild natives of Siberia. Numbers of them affirm that the strange beaklike muzzle of the rhinoceros really belonged to a gigantic bird which haunted Northern Siberia in former days, and that their ancestors fought desperate battles with this giant of the air, and only overcame it after the most violent conflicts; further, that the leg-bones of the rhinoceros formed the quills of this great bird, and the monstrous horns of the rhinoceros (which are often three feet in length) are the claws of this gigantic flying creature. So much do the horns of the rhinoceros resemble the claws of a colossal bird that the Russian traders always call these horns 'bird's claws;' and when Erman was at Yakutsk in 1829, and pointed out to the traders that the relics there really belonged to the rhinoceros, the traders replied that they had always called the horns bird's claws, and saw no reason to alter their opinion!

The extinction of the rhinoceros in Siberia presents a problem most difficult to solve. We must remember that this extinction took place in comparatively recent times, and that the animal disappeared from northern Asia long after the appearance of man on the earth. We know that

this must have been the case, because the remains of the animal which are found in Siberia are as a rule quite fresh, and are found close to the surface of the ground, and the plants and animals that are discovered with them are generally those which live at the present day. We must also find a cause for the extermination of the rhinoceros not only in one district, but over the whole of Siberia; and we must discover some reason for its disappearance not merely from the frozen islands in the Arctic Ocean, but also from the warm and genial valleys of the Altai Mountains.

It is ridiculous to fancy that man exterminated the rhinoceros in Siberia. There is not the slightest evidence that man lived in Siberia when the rhinoceros roamed over that region; and even if man had been contemporary with the great beast, he could not have exterminated the huge hairy monster with his flint arrow and rude stone spear. The idea is absurd. That the climate of the New Siberian Islands has changed since the rhinoceros inhabited them is certain; and if the intervening land at the same time sank beneath the waves, it is beyond doubt that those animals which lived in the northern islands would perish from want of food. But this will not account for the extinction of the rhinoceros in Southern Siberia and in the warm valleys of the Altai, where food was plentiful, and where, so far as climate was concerned, it might have lived till the present day. Moreover, if the climate of Northern Siberia changed slowly, the rhinoceros might easily have migrated to the warmer regions in the south; but if the climate changed slowly, the rhinoceroses of the Vilui and the Yana could not have been at once frozen up, and not thawed out until the bodies were discovered in the eighteenth century. In fact, the climate must have changed quickly.

We are face to face, then, with a mystery, and it is clear that the extinction of the rhinoceros all over Siberia must have been brought about by some unusual and tremendous cataclysm, accompanied by an extraordinary change of climate. Perhaps the vast inland seas which not long ago occupied large portions of central Asia were suddenly drained of their waters, and along with these convulsions violent volcanic outbreaks occurred, during which much of Northern Siberia sank beneath the Arctic Ocean. Thus perished the Siberian rhinoceros in all its pride and in all its power, overwhelmed by a catastrophe both sudden and tremendous.

THE KAISER: ANOTHER VIEW.

THERE is an old saying to the effect that a fact is a lie and a half-which means, presumably, that no fact, or array of facts, can convey a true impression if other facts are kept out of sight. We frequently hear men quoting | drawing conclusions from insufficient data.

a fact as if it were the last word that could be spoken on a subject, while at the same time equally important truths are suppressed. Half the mischief we suffer is due to the habit of

In a recent issue of this Journal appeared a most interesting sketch of the Kaiser. I call it a sketch, because, although the article was somewhat lengthy, it was obviously incomplete. In the article referred to the Kaiser's home and political duties were dwelt upon, his versatility was described, and especially was his ambition given prominence. The Emperor's dictum about Germany's future being 'on the water' was mentioned; and, in the writer's opinion, since Germany will continue to build ships as long as she can find the money, it is necessary for us to build at the rate of two to one. Now, of course, one Britisher has a perfect right to hold such a view, just the same as another has an equal right to resist it; and, since the mad rivalry between Britain and Germany is caused by this supposed divining of each other's motives, it is as well to look at both sides of the picture, and save ourselves, if we can, from folly.

It is important that we should bear in mind that Germany's representative man is neither the late Prince Bismarck nor Admiral Tirpitz, but the Kaiser himself. This is vital, because the sentence which is bandied about is that Germany's policy is the Bismarckian policy of 'blood and Many in this country have repeated that expression until they have convinced themselves of its truth. We may take it for granted that 'Germany's policy' is identical with that of the Kaiser. But if the Kaiser's policy is the Bismarckian policy of 'blood and iron,' perhaps somebody will explain how it happened that not long after the Emperor came to the throne he dropped Bismarck! Sir John Tenniel's cartoon, 'Dropping the Pilot,' will be remembered. Between Bismarck and the Kaiser there is a gulf fixed. The Kaiser is a true gentleman, and his very faults-some of them, no doubt, derived from his independent English mother proclaim that he is full of human feeling too.

Very little is said concerning another vital feature. The German army is admittedly the model army of the world. At any rate, most of the foreign nations are so confident of this that they send their officers to Deutschland to learn the science of war. You only need to spend a holiday in Prussia to gain the impression that there militarism is in a high state of perfection. The navy, too, is supposed to be efficient. Well, the Kaiser is the head both of army and navy, the head, too, of one of the European nations which is growing numerically; and yet, though he is the oldest reigning monarch, save one, in Europe, he has never sent forth his hosts excepting to a Kriegspiel. It is quite in order for people to ask what is the purpose of all this strengthening; but if you look at the map you will probably feel that other motives besides those of aggression are in the minds of the German rulers. For on the west is France, frankly inimical; on the east, Russia, the close ally of France; and on the south, Austria, who has reasons of her own for not entertaining cordial feelings towards her neighbour.

The mention of France leads one's thoughts to Germany's supposed harsh treatment of France in 1870-71. But recall how that disastrous war originated. The Emperor Napoleon was anxious for a quarrel with Germany, and found an excuse when a German prince was invited to occupy the throne of Spain. The French Emperor intimated that such an arrangement would be an offence to France; but when the prince expressed a desire that Spain should look elsewhere, Napoleon's mischief was, for a moment, checkmated. Presently, however, he required from Berlin an assurance that never again should any German prince consider such a proposal. Berlin sent a curt rejoinder, and immediately the French troops were across the frontier, and drew the first blood. This being so, the Kaiser deserves commendation, and not condemnation, for maintaining the position of his forebears. The Germans did take Alsace-Lorraine; but do not forget that before those provinces were in French territory they belonged to Germany, and were lost by Germany at the Treaty of Ryswick.

It is customary to enlarge on the Kaiser's indiscretions, and to refer to the Krüger telegram. Nothing, however, is said about the universal criticism which we endured in those days. The nations, small and great, had their fling at Great Britain then. But after the war the Kaiser came to this land for a holiday, and said in conversation that if he had been the enemy of Britain, desiring her ruin, how did they explain the fact that he had kept the ring at that trying time? He had been approached; we were already beset; yet he remained impartial. No one can deny the truth of that. As we know, the Daily Telegraph published this conversation, and a rumpus ensued in the Reichstag. But the German parliamentarians, whilst they hotly protested against the publication of State secrets, did not question the truth of the Kaiser's revelations.

A small incident will confirm the Kaiser's claim to friendliness. At the time of the South African war the tone of Germans toward Britons in their country was one of ridicule rather than hostility; and in the shops absurd post-cards were displayed, on which the Prince of Wales, represented as a comical figure, was spreading destruction among the Boers by means of a ship's ventilator, and so forth. One evening a mariner from Hull decided that in the morning he would furnish himself with a set of these post-cards. That night, however, a remonstrance was made in the House of Commons, and the hope expressed that the Kaiser would interfere. The next morning the mariner looked in vain in the arcades, the Pferdemarkt, the Jungfernstieg, and elsewhere for the offensive pictures. During the night the Emperor had spoken, and as if some good fairy had waved a wand, the cards had all vanished. A very suitable text when speaking of the Kaiser Wilhelm is: 'Actions speak louder than words.'

His Majesty has, however, uttered statements which somehow we allow ourselves to overlook. For example, he has said more than once that the coming peril is the 'yellow peril;' and if Britain, America, and Germany would stand together they would assure the peace of the world. It is perfectly reasonable for one member of the great Teutonic family to hope for an alliance of Teutons everywhere, and surely in entertaining such a hope the Kaiser has a right to look for support.

When the Emperor received with the utmost geniality the British editors, he addressed them as 'Gentlemen and Brothers.' Now, either the Kaiser is sincere, or else he is a modern Machiavelli. I firmly believe that all the German Emperor's actions have confirmed the veracity of his words spoken in considered moments. There is not a shred of evidence that his intentions are different from his declarations. Mere suspicion is a poor weapon, and no man's character is safe if suspicion reigns. All that we know about the Kaiser shows that he is quite properly called the Friedenskaiser, and may he live for ever!

COINCIDENCE OR ---?

OVER half-a-century ago a newly married couple set sail in the good ship Matoka, bound for New Zealand, where the bridegroom had already made his home along with others of the Canterbury settlers. In those sailing days the voyage thither was a matter of some three months, and the food and arrangements not, as now, comparable with the modern first-class hotel; but, on the other hand, one was not cramped into the space of a present-day P. & O. cabin, but had room-like quarters, with windows instead of portholes; though one had to furnish these cabins one's self, providing bed-linen too, and other necessaries. A three-months' voyage, with all its attendant dangers, deprivations, and discomforts to a bad sailor and a carefully nurtured girl like the bride, bidding friends and relations a farewell destined to last twenty long years, in order to face the unknown at the Antipodes, required courage not demanded nowadays of those about to start on a long voyage. At the outset she was bereft of many fond mementos, for as the ship started it was discovered that her case of jewels, placed in the cabin while the vessel was lying at the London docks (they embarked at Plymouth), had been abstracted by some miserable thief, and no trace of it was ever found.

Her husband tells a tale showing one of the many hardships referred to. After they had been some weeks at sea murmuring arose among the steerage emigrants as to the water, which was pronounced undrinkable. He was one day standing with the skipper on the poop, when they saw a deputation advancing, led by a respectably dressed man in a top-hat, who was carrying a glass of water, brown and brackish-looking, the smell of which was only too perceptible. Presenting the glass, the top-hatted one stated that the water was totally unfit to drink. The captain took the glass, held it up to the light, eyed it critically, then, tossing the contents off, he smacked his lips and declared that he found nothing wrong with the water. The unfortunate

deputation retired, dumb and crestfallen. The skipper then turned to his companion and said, 'What else could I do?' There is no other.'

The voyage was rough. However, the Cape was rounded, the 'Roaring Forties' successfully weathered, and eventually Captain Stevens brought his ship, passengers, and cargo safely to land. During the seven succeeding years the Matoka made many a voyage from England to New Zealand and back, then as now out by the Cape of Good Hope and back round Cape Horn. Then once more he prepared to sail her home with her cargo of hempen flax, wool, and gold-at that time New Zealand's staple products, but nowadays largely supplemented by frozen mutton. This time, however, he double-provisioned the boats, and even went the length of warning intending passengers that the Matoka was bound to be lost on the next voyage. He had had a dream to that effect, though he would have attached little importance to it but that twice before he had had dreams both verified in the event. He does not appear to have related the particulars of this third and last dream; but on the first occasion he had during a voyage dreamt vividly that his wife, whom he had left quite well, was dying; and on reaching port he found she was dead. Of the second dream and its fulfilment I was told in Italy only two years ago, forty years after, as this veracious history will proceed to

So strong was his presentiment after the third dream that Captain Stevens even proceeded to part with his possessions. Among them, left on board during the last voyage by a passenger, was a second edition of Bleak House, which he presented to a little boy of six years old, who to this day well remembers the hanging bookcase from which the captain handed him the volume; for he had gone with his father to see his mother's lady's-maid off, who was going back home in the Matoka, her 'young man' having come out from England after seven years to fetch her, and marry her.

Amid the God-speeds of the watchers on shore the good ship Matoka sailed round the Lyttelton Heads, and from the moment she was lost to view she was never seen or heard of more! Whether she was wrecked in a fog or gale on the rocks of Cape Horn-those towering, fearsome rocks—or foundered far from help; whether, her cargo of wool having taken fire, she was burned to the water's edge in these lonely Southern seas; or whether she was crushed by icebergs, no one ever knew. A sailing-ship has little chance in the ice; she cannot thread her way in and out among the bergs, as did a steamer in which, many years later, a sister of mine voyaged on those seas, where the ship was three days amid some thousand bergs, and might easily have suffered the fate of the Titanic, without the help of wireless telegraphy, then For forty years that unknown or untried. volume of Bleak House lay at M-, the home of my husband's childhood.

After a lapse of some thirty years I accompanied my aforesaid sister, who had been recommended to take a sea voyage to New Zealand, and on board met for the first time my future husband, that self-same little boy, a complete stranger to our family and acquaintance. Arriving in the country, I twice visited M-—; but as after our marriage we were bound for a distant tropical clime, we took away few of his belongings, so that Bleak House remained undisturbed. Returning thither a third time, I decided to take back his books; and one day, on my looking through the pages to find those volumes that bore his name, the curious discovery was made that, not on the fly-leaf or the frontispiece, but between the latter and the preface, both slightly adhering, was inscribed my maiden Yes; and before it were the initials name! of a half-brother, many years older, who, I remembered being told, had forty years before come out to New Zealand to a sheep-farm, and had subsequently fought in the second Maori No doubt he it was, a great lover of Dickens, who had left Bleak House on board the Matoka, the volume strangely falling into the hands of the unknown little child destined many years later to become his brother-

A few months after this discovery I met my brother, whom I had not seen for twenty years, in Italy; and there he added the following interesting links to the chain of events:

On arrival in New Zealand he was bound for an up-country station, and, being obliged to 'travel light,' he decided to leave his books—already read—on board. Before leaving finally, hearing that the ship was preparing for the return voyage, he ran down to port to see Captain Stevens once more. He first came across the mate, whom he found looking 'very glum.' 'What's the row?' was the boyish query. 'Oh, I've had a dream. We're all

going to be lost on this trip.' 'Nonsense, man!' said my brother; 'don't you believe anything of the sort;' and he tried to cheer him up. He then ran up and found the captain in his cabin, and as he also was looking 'down in the mouth,' my brother asked him what was wrong. 'My boy, we sha'n't meet again; we are never coming to land this voyage. I've had a dream which told me so.' 'Why, you have been talking to the mate, who says the same,' rejoined my brother. 'What!' ejaculated the captain; 'do you mean to say he has had a dream too? I didn't know it. Then we're done!' My brother found it was no use trying to reassure him, so he said good-bye, and never saw him or heard of the ship again.

Asked if he could tell of what nature were these last dreams as a clue to the fate of the *Matoka*, my brother said he could not; though he had learnt the particulars of the captain's second veridical dream from the mate, who was with him during a voyage many years previously on board some other ship, and they

were as follows:

The mate, one morning at sea, was told by Captain Stevens that he had the night before dreamt they were wrecked, that the ship was cast ashore, and every one was clear of her, but that when he looked at her in his dream the ship was absolutely bare, presenting a queer appearance, for which he could not account. In due course they really were wrecked during that voyage, but the captain gave no thought to his dream, being much too busy saving life and everything else in the ship. Seeing that he could not get her off, and as there was plenty of time, he ordered her to be stripped; and masts, yards, beams—everything available was taken ashore. As they were being finally rowed away from the wreck the mate looked back at her, and then, touching the captain on the shoulder, said, 'Look at your dream.' And he looked, and the ship was bare—absolutely bare.

BELHAVEN SANDS.

PALE sea, a misty sky, a stretch of sand,
The white surf breaking on the yellow line;
An undulating width of hills inland,
Silver and gold the sparkling of the brine.
Blue are the poplar-trees and slender firs
That fringe the rounded distance of the bay;
And blue the ripple that the west wind stirs
Across the ocean's bosom far away.

Down through the spangled meadow green and white A silver ribbon wanders to the sea;
A rocky island glimmers into sight,
Guarding the jewelled distance mistily;
And tender memories of bygone things
Pass with the flashing of a seamew's wings.

IVEIGH MORE NISBETT.

'HONEST JOHN,'

THE SHEPHERD-FRIEND OF ROBERT LOUIS STEVENSON.

By Joseph Laing Waugh, Author of Robbie Doo, Thornhill and its Worthies, &c.

ZERY few among the numerous readers and admirers of Robert Louis Stevenson will recognise this character by the above sobriquet. But to the older Swanston residents, and to those of the immediate locality, it will make a direct appeal, and carry them back in sweet recollection to a time when the Swanston hirsel was of more importance than it is now; when our much-loved novelist first feasted his boyish eyes on beauties of mountain, wood, and glen, and made of that sweet secluded spot a glamourhaunted shrine which will ever be dedicated to his memory and wedded to his name.

We are all more or less familiar with John Tod, the Swanston shepherd. The masterpainter has portrayed him faithfully and well, now in deft, quick sketches, and anon in broad, telling, truthful details; and so concisely yet so daintily treated is the picture that it might well be deemed presumptuous of any modern meddler to attempt a single extra brush-mark on the

In these days, however, of retrospect and reflection, when each successive year widens the gulf between the present and the interesting past, and when the sayings and doings of even the humblest among the originals of our great writers attach to themselves an added value, it is quite permissible-nay, incumbent and imperative-that any one with the necessary knowledge should speak of what he knows, especially if it is calculated to remove some popular error or add anything of interest and verity to what has already been said or written.

During last summer, in the course of frequent rambles among the Pentland Hills, I came in contact with many who knew John Tod personally; and so interesting do I deem the information thus procured that I make no excuse or apology for adding, by way of supplement, my contribution to a subject which has already been treated by an abler pen than mine.

Reference to John Tod in Stevenson's works is confined to St Ives and Memories and Portraits; and in connection with the former it is worthy of note that in the earlier chapters of this work Tod is called Sim and in the later Tod, spelt, however, with two 'd's.' Had these last chapters been revised by Stevenson, doubtless

No. 163.—Vol. IV.

'Pastoral'—is devoted to him and his dogs. When Tod's old friend Robert Peebles asked him

the name Sim would have been used through-

friend was the model on which that outstanding

character had been constructed.

It proves, however, that our old herd

In Memories and Portraits a whole chapter who was the laddie with the velveteen jacket who so regularly accompanied him to the hill, John replied, 'Man, he's a son of Maister He's the de'il an' a' for askin' Stevenson's. questions; and the queer thing about him is, he writes doon every word I say.' I wonder how often Stevenson read over these hastily scribbled notes during his subsequent wanderings, and prior to his writing this beautiful appreciation. Well thumbed, I ween, were these note-book pages, hallowed and dear the associations they recalled, for the tinkling music of that nameless trickle that springs in the green bosom of Allermuir is in his ear when he writes of John Tod, and his loving thoughts are of Halkerside and Shearers' Knowe. Many times and oft have I read this soul-satisfying sketch, and with each successive perusal an added beauty has been disclosed. As a human analysis it ranks with Dr John Brown's letter to Dr John Cairns; and these two appreciations, the one of a humble, unknown shepherd, the other of a reverend, loving father, will ever be associated in my mind, for they were both written from a fullness of knowledge and were the outcome of the deepest loving regard. Tod's whole personality, his fidelity, his rugged independence, his sterling honesty and integrity, his violence of temper combined with his softness of heart, all deeply impressed the great master, and he straightway touched him with his magic pen, and made the shepherd's memory immortal. 'Pastoral,' which is the sixth chapter in Memories and Portraits, first appeared in Longman's; and in one of his letters to his old nurse 'Cummy,' Stevenson asks her to procure a copy to show Mrs Tod what he

had made of her goodman.
'Honest John' was the nickname by which
John Tod was popularly known not only during his long tenure of office at Swanston, but long prior to that, when in his early manhood he superintended the hirsel at Spittal, overlooking [All Rights Reserved.] JANUARY 10, 1914.

Carlops; and he earned it by the uprightness and probity of his character. It is only since his death that he has become known as 'the Roarin' Shepherd,' an appellation given him by a local photographer, and one which, I may add, has been keenly resented by every member of the shepherd's family. That he had a strong, penetrating, stentorian voice we are fully assured, and have no reason to doubt; and that in his solicitude for the well-being of his easily scared flocks he used his powerful lungs to some purpose, particularly when a wandering dreamer, accompanied by a dog, insisted on visiting, at all and sundry times, every nook and cranny in the Swanston hirsel. But surely there was in this no sufficient reason why the memory of his name should be associated with the bovine denizens of Bashan, more especially when he already possessed one which was not only more euphonious, but more truly indicative of his character.

It is, however, some little consolation to know that by those who knew him best he is still remembered among the solitudes of the Pentlands as 'Honest John,' and I venture to trust that when a second edition of the admirable book on Stevenson's originals is called for, 'Roarin' Shepherd' will be deleted and give place to the more appropriate 'Honest John.'

In olden times, before the handloom was superseded by the more modern up-to-date machinery, weavers were classed in the category of thinkers with shepherds and souters. Their occupations were conducive to mental exercise, and many examples might be quoted of men who acquired fame and renown whose thoughts ran in unison with their shuttles, who sifted mighty social problems as they pointed their roset-ends, and who contributed much towards the literary assets of our country while watching their flocks on the quiet hillsides.

So far as I know, John Tod left nothing behind him by which he could lay claim to literary renown; but he left its equivalent—the lingering memory of a life ungrudgingly devoted to his master's interest, the record of triumph and success in spite of mountains of difficulties, and a name clean and unsullied, which I know it is his family's dearest wish to maintain.

The Tods for generations were a family of shepherds, hailing originally from Peeblesshire; and John, the subject of these random notes, was born at Lochurd, a small hamlet in that county. As already indicated, his first responsible charge was at Spittal and Patie's Hill, and it was on this hirsel, when he was a married man with a large family, that the following incident happened.

One Sunday morning, shortly after sunrise, he was going his rounds; and on nearing the farm-house of Friarton he discovered the mangled carcass of a sheep at the bottom of a hollow. Proceeding to the farm to give the alarm, he

saw two dogs splashed with blood exerting themselves to their utmost to wash away in the milllade the damning evidence of their midnight depredation. He at once gave chase. The dogs skulked away citywards over Patie's Hill to Nine Mile Burn, with John in hot pursuit. Finding himself impeded by his foot-gear, he hastily kicked his boots off at Saltersykes, and left them on the sill of John Ritchie the carrier's window. Fleet of foot and stout of heart, he kept up the chase through moor and field, never for a moment losing sight of his quarry, past Marchwell, skirting the back of Easter Howgate, up Castlelaw, over Caerketton, past Fairmilehead, and into Morningside; and when Robert Welch, the Tollcross dairyman, heard the bark of his truant dogs he at once got out of bed; but before he could admit them 'Honest John' was on his threshold, and the two delinquents, having been, as it were, caught in the act, ultimately paid the penalty of their midnight marauding. Roughly speaking, this was a race of about fourteen miles, and I wonder who, amongst those who lay no claim to athletic training, would start on such a run across country, breakfastless, on a Sunday morning, when an extra hour in bed is permissible and usual.

Even as an old man John's power of endurance on foot was remarkable. His son, William Tod, of the North Esk Reservoir, informed me that the last time he saw his father alive was at the funeral of John Gray of Harper Rig. 'Honest John,' then seventy-one years of age, had walked all the way from Swanston; and when, after the funeral, he was partaking of some refreshments, he informed his son that 'if there was nae convenient train back he would just daunner quietly hame by the same road as he had come.' Harper Rig, by the road John travelled, is between thirteen and fourteen miles distant from Swanston; and, as there was no convenient train, he did 'daunner hame'—a wonderful feat for an old man of over threescore years and ten.

Early to bed and early to rise was his motto throughout his long and arduous life, and, summer and winter, he was as a rule the first on the scene of the day's operations. He might with very good reason have taken credit to himself in this, for in those days there were no lieabeds in the clachan of Swanston.

He often told, with a laugh and a merry shake of his head, how on the first morning after taking up his duties there, and when leaving his cottage for the hill, he saw, in the dull morning light, one of Mr Finnie's old women-servants knocking at the gardener's window. 'Robbie, get up; haste ye, get up, man,' she was calling; 'it's half-past three, and I ha'e sleepit in mysel' this mornin'.' 'Dod, man,' he used to add, 'that was settin' the pace wi' a vengeance; but although Swanston rose wi' the hens and the sun, I was aye up wi' them; ay, 'deed, and sometimes before them.'

Though not heavily built, Tod was of great bodily strength, and in moments of sudden irritation he sometimes tackled curious physical problems. On one occasion, when, with a flock of lambs, he was rounding the corner at Valleyfield Street, Edinburgh, on his way to the market, a horse-tram came along, and without slowing down ran amongst his flock, scattering them in all directions. John rushed to the horses' heads, and with a mighty push sent them back almost on their haunches. 'Dash ye!' he roared to the driver. 'I've held up the stage-coach for five meenits before noo, and d'ye think I'll allow an suld tin-tan horse-car like yours to run me doon? I've a guid mind to back ye doon Lothian Road;' and the wonder was he did not attempt to do so.

He was a noted trainer of collie dogs, and he had always two of these shepherd's friends at his heel. He rarely boasted of their sagacity and intelligence; as a matter of fact, he took these essentials for granted. His son William has a full store of anecdotes regarding these canine pupils of his father's, and nothing delights him more than to relate them to a sympathetic listener. An old dog named Swag was a special favourite; in fact, he was one of the most useful and intelligent that John ever possessed. The late Mr Finnie, when proprietor of Swanston, went in largely for sheep and cattle stock, and hardly a Wednesday passed but Honest John, accompanied by Swag, was present at the Leuriston market, either with stock for sale, or afterwards driving purchases home to the birsel.

After Mr Finnie's death the stock was largely reduced, and visits to market were not so regularly necessary; but this made no change in Swag's programme, for, if his master remained at home, Swag, early in the morning, went off on his own, and after spending the day assisting other drovers and shepherds, he returned at night to Swanston weary and tired-out, and ready for the usual bicker of porridge-and-milk which was sure to be awaiting him.

Stories illustrative of the wisdom and endurance of the collie are numerous, and on this subject much of interest could be told which perhaps would not be readily believed, for tellers of doggie stories and fishing yarns are often, and sometimes not without reason, looked upon as descendants of the unfortunate Ananias. Did such a comparison occur to Stevenson when, seated on the hillside, he learned from John's own lips what Swag did, 'yestreen, no farer gane, just by the way, ye ken;' or what Cheviot accomplished 'a' by himsel', and without my eye on him'?

In St Ives, near the end of the tenth chapter, when describing the hero's southward flight in the company of the two drovers, Sim and Candlish, Stevenson puts the following into the mouth of St Ives: 'Dog stories particularly abounded with them, and not only the dogs of the present,

but those of the past contributed their quota. "But that was naething," Sim would begin; "there was a herd in Manor, they ca'd him Tweedie. You'll mind Tweedie, Can'lish?" "Fine that," said Candlish. "Aweel, Tweedie had a dog"—— The story I have forgotten; I dare say it was dull, and I suspect it was not true; but indeed my travels with the drovers had rendered me indulgent, and perhaps even credulous, in the matter of dog stories.'

This is beautifully put. There is little of the conversation given, but much may be surmised, and the fragments we have breathe the true atmosphere of the hillside and the drove-road; the desire to cap a previous story, the alternate question and assertion, the name and location of the owner of this canine paragon, all bespeak the natural and human. And the great master was, in this, probably writing the recollection of a conversation he had had with Honest John of Swanston in the never-to-be-forgotten days, and long before he dreamed of a Samoan home. But as for thought of Ananias—well, I doubt it in the case of John Tod, for I am assured Stevenson had often at Swanston had ocular demonstration of more wonderful examples of canine sagacity than could well be conjured up in any herd's imagination.

One remarkable story, the truth of which I can vouch for, occurs to me, and I will tell it as it was told to me by Honest John's son at North Esk.

'Yes, man, I've been among collie dogs all my life, and I've kent a guid mony o' them very intimately; but I never came across a dog like Swag. He has a place in my he'rt which nane else ever had, or ever will have. He was one of the best of my faither's dogs, and saved him mony an exertin' walk, and maybe that is why he gripped my he'rt-strings to sic an extent. I could tell ye o' mony queer, auld-farrant things he did; but his last ploy was the best, and it's freshest in my mind.

'Aboot this time my faither didna gang very often to the market o' a Wednesday. The stock had been sairly reduced; in fact he had very little herdin' work to do. But ae day he had gone in, just for auld langsyne, and he was standin' takin' note o' prices, when a friend o' his, the farmer o' Candiebank, cam' up, and says he, "Man, John, you that are sic a guid judge o' a collie, can ye no' put me in the way o' gettin' an honest workin' dog?" My faither scratched his head and thocht for a meenit, and says he, "Dod, man, I dinna ken that I can; but-let me see now-ay, there's Swag; he's auld, and maybe past his best, but there's mony a guid day's work in him yet; and if he'll suit you, you're welcome to him." "Would you pairt wi' Swag?" Candiebank asked in surprise. "Yes," says my faither. "I've nae work for him, and dogs are like folk-they're aye best when they're employed. I ken you'll be kind to him, and, as I say, you're welcome to him; but I'll gi'e ye a word o' warnin': tie him up on Tuesday nicht, or he'll be here at the market on Wednesday as sure as you're a livin' man."

'Assurin' my faither that he would see to this, and well pleased with his prize, Candiebank went off to Biggar wi' Swag on a rope-leash. When my faither cam' hame without the auld dog we were in an awful state. Man, it was as if there was a death in the family, and every one o' us, from the youngest to the auldest, missed him and lamented his loss.

Next Wednesday nicht, aboot seven o'clock, I was sittin' at the door polishin' a new hazel stick, when, lo and behold! Swag cam' roon' the hoose-end, and made for his porridge-dish as if he had never been a day away. In spite o' Candiebank's precaution, he had got clear away on Tuesday, travelled a' nicht frae Biggar to Edinburgh, worked a' day at the market, and, as usual, had trotted off hame to Swanston. He was never sent away after that, and he ended his days amongst us. And, man, d'ye ken, when I saw him that nicht comin' roon' the gable corner—I'm kind o' ashamed to tell you -although I was thirteen years old, and a big boy at that, I bursted oot greetin', and grat like a bairn.'

Ah, William Tod! why should you be ashamed of those boyish tears; for do they not prove that you possessed then what you possess still, that kindness and lovingness of heart, that sympathy and kindly feeling for all in trouble and distress, which, mark you out as the worthy son of a worthy sire, and one of God's own gentlemen?

Frequent visits to Swanston during the past summer, and many interesting conversations with two intelligent sons of the clachan, have not only added to my knowledge of the 'toon' and its worthies, but have tended to confirm what I have for long surmised, that, with the exception of Robert Young the gardener, John Reid or Ridd the farm grieve, and John Tod the shepherd, Stevenson was but little interested in any other of its inhabitants. Adam Ritchie he may have known as the ploughman, and a nodding acquaintance may be assumed, as I have it on the authority of the late Mrs Ochiltree of Swanston sweetie-shop fame, and widow of the toll-bar keeper at Fairmilehead, that Stevenson was liberal in his recognitions, and she gave him credit for being the most courteous boy in the locality; for, as she put it, 'he never passed ony o'us womenfolk withoot raisin' his hat.' His reticence, however, and his characteristic shyness were a bar to any further acquaintance; and, with the exception of the names I have mentioned, we may take it that his social circle of Swanston friends was a very small one indeed. I have in my mind's eye the picture of a pawky-faced old Swanston resident who long posed as a very intimate friend of R. L. S., and whose stories relating to his boyish days were exceptionally interesting; but from the fact that she called him 'Bobby,' and pointed out the farmhouse and not the Cottage to interested visitors as his early home, we may safely discount much of what she related in story and claimed in acquaintance.

To the gleaner of Stevensonian anecdotes the harvest in and around Swanston is a meagre one. The years he spent there were those of his literary apprenticeship, and to the few who noted his presence he was merely Maister Stevenson's son. It was not till years after-wards, when *Treasure Island, Kidnapped, The* Master of Ballantrae, and Catriona had each in turn delighted two continents, that it dawned upon the minds of the inhabitants of Swanston that, unawares, they had been entertaining an angel—a literary angel, if I may be allowed the term. And, lo! brain-chambers were ransacked, bygone events connected with the Cottage were sifted and resifted, imagination was called upon to supply what memory failed to recall, and the result— Well, those who harped to their profit upon the Stevenson string are quiet and silent now; God's acre holds them, and peace be to their ashes.

Swanston's contemporaries with Stevenson are now very few. They can almost be counted on the fingers of one hand; but, fortunately for us, they have retentive, reliable memories, and they know of what they speak. I anticipate with pleasure during the present winter a cosy seat in at least three ingle-nooks, in the corner of which, through tobacco-reek, and inspired by a heart-to-heart crack on the Swanston toon of long ago, I shall see in imagination my hero seated on a mossy rock in Halkerside, with John Tod, plaided and alert, beside him; or by the stunted vegetables in the Cottage garden with the eident gardener, John Young, when that old worthy declared that Paul may plant and Apollo may water, but God giveth the increase.

Though living in Swanston yet not of Swanston, and having totally different interests and aspirations, the Stevenson family were not above associating themselves with the little events which from time to time disturbed the even tenor of clachan life.

On one occasion Lizzie Grant, the tablemaid, rushed into the dining-room during dinner, and hysterically announced that 'Robert Pillans, the cattleman, had faun off a hayrick, and hurt his side.'

'Oh! that's very sad,' sympathetically exclaimed Mrs Stevenson. 'I hope none of his ribs are broken.'

'That I canna' tell, mem,' replied the distracted domestic. 'I dinna ken if it is the side his ribs are on that has been hurt.'

Mr and Mrs Stevenson called frequently on John Reid, the grieve; but there was only one house in Swanston that their famous son visited

that of Robert Young, the gardener. only he called on Robert Peebles in company with his aunt, Mrs Balfour, wife of Dr Balfour; but the family of John Tod assure me that he was never within their father's door. taken with the fact of his close intimacy with and keen appreciation of Honest John, is very remarkable.

As one may gather from the two chapters, 'Pastoral' and 'An Old Scotch Gardener,' in

Memories and Portraits, Stevenson knew and judged these worthies not socially, as family men, but as faithful, serious workers in nature's field and garden; and through this knowledge our Scottish literature is the richer by two outstanding sketches, which are redolent of the boxwood-bordered plots and the quiet hillside, and which bring to our miud's eye two splendid types of Scottish character, and make two humble, honest names immortal.

KNIGHT ON WHEELS.

CHAPTER VI.-RENOVARE DOLOREM.

THE leaven was working.

One evening after tea Philip took a big breath and addressed his uncle. 'Uncle Joseph,' he said, 'I was talking to a little girl on Hampstead Heath to-day.

'More fool you,' was the genial response.
'What were you talking about?'

'You,' said Philip, a little unexpectedly.

Uncle Joseph looked up. 'Oh!' he said.

'Why was I so honoured?'

Philip explained, in his deliberate fashion. 'She was that little girl we passed on Sunday,' he said, 'sitting on a gate. She smiled at me, and you told me it was only an instinct. A prebby—a prebby'

Uncle Joseph assisted him.

Well, I met her again 'Predatory instinct. one day, and I told her what you said. I explained that you knew all women were dangerous, and were the great stumbling-block to a man's work in life. Also parasites.

Uncle Joseph smiled grimly. 'V what did she say to that?' he inquired. 'Well, and

'She said she would ask her mother about it.' 'They always do,' he Uncle Joseph nodded. 'And what did mother say?' commented.

'Her mother said'-Philip hesitated.

'Go on,' said Uncle Joseph quietly.

'She said that—that the reason why you thought that all women should be avoided was known only to one woman, and she wouldn't tell.'

Colonel Meldrum rose to his feet and laid his pipe upon the mantelpiece with a slight clatter. Philip eyed his uncle curiously. There was a change in his appearance. He seemed to have grown older during the last ten seconds. lines of his face were sharper, and his stiff shoulders drooped a little. Then came a long Uncle Joseph had and deathlike stillness. turned his back, and was gazing into the glowing fire, with his head resting on his arms. Philip, feeling a little frightened, waited.

At last Uncle Joseph spoke. 'How old are you, boy?' he asked.

'Fourteen,' said Philip.

There was another silence. Then Uncle Joseph spoke again. 'You should be old enough to understand now. Your friend's mother was right, Phil. Would you like to hear the story? 'Yes, please,' said Philip.

Uncle Joseph turned round. 'Why?' he

asked curiously.

Philip replied with characteristic frankness. 'Because,' he said, 'it might make it easier for me to keep away from all women, like what you told me to do, if I knew the reason why I ought to.'

'You are beginning to find it difficult, then?' Philip, thinking of a blue cotton frock and a

pair of brown eyes, nodded.

'Then I will try to make it easier for you,' said Uncle Joseph. 'It is my plain duty to do so, for if once you get into your head the notion that woman is man's better half and guiding angel, or any sentimental, insidious nonsense of that kind, you are doomed. Your father allowed himself to cherish such beliefs, and he died of a broken heart before he was forty. You are your father's son.'

'Who broke his heart?' asked Philip, looking up quickly. It was the first time that Uncle Joseph had ever mentioned his father to him.

'Your mother,' said Uncle Joseph bluntly. 'She broke another man's heart later on, but that is another story. Perhaps the other man deserved it; but your father, above all men, did not. Have we read Tennyson together?'

'Yes,' said Philip. King."' "The Idvlls of the

'You remember King Arthur?'

Philip nodded, beginning to comprehend.

'Well, your mother was Guinevere.'

Philip was silent for a while. Then he asked.

'Is that why you say we must avoid all women?'
'Partly. There was my own case as well. When I was well over thirty, Philip, I fell in love. I had never loved any woman before. My whole life and soul were bound up in the regiment. I fell in love with the regiment when I joined it as a little subaltern, and I worshipped it for sixteen years. In course of time they made me adjutant, which cures most men of such predilections, but it only made me feel as proud as a hen with eight hundred chickens. We saw

service, and promotion came quickly. Then, just as I got my final step, and became commanding officer, I met a girl, and fell in love with her. It was in Calcutta. She was the spoiled beauty of that season, and I was the youngest colonel in the Indian Army, so every-

body thought it a very suitable match.

'We did not get engaged for quite a long time, though. Oh no! First of all, I had to learn to dance attendance. As I say, I had never been in love before, or even had any great experience of women. All my time had been lavished on the regiment. So I laboured under the delusion that if a man loved a woman his proper course was to tell her so straight, and prove his words by devoting himself to her service. I have learned wisdom since then, but that was what I thought at the time.'

'What ought you to have done, Uncle Joseph?'

asked Philip curiously.

'I ought either to have bullied her, or gone and made love to another girl. Those are the only two arguments which a woman appreciates. But I made myself too cheap. This girl, as soon as she found that she was quite sure of me, began to play with me. She ordered me about in public, and I loved her so much that I obeyed her, and did not regard her behaviour as the least underbred or vulgar. She gave me rather degrading odd jobs to do, and I did them, proud to think that I was her squire. As for presents, if I gave her something that she did not chance to want, or possessed already, it was declined with every manifestation of offended propriety; but if she did happen to require anything, from a box of chocolates to a box at the theatre, she told me to get it for her, and I did so gladly, for I felt that all these little trifles were gradually binding us together. I had not quite grasped a woman's idea of playing the game in those days, you see. I thought all this aloofness of hers was due to a young girl's reserve of character, and that, being too shy and timid to tell me in so many words that she cared for me, she was accepting all my devotion and my little offerings purposely and deliberately in order to show me that although she could not bring herself to say the word at present, she meant to do the square thing in the end. I loved her for that, and tried to be patient. But once, when I, presuming on this theory of mine, suggested to her that she must care for me rather more than she gave me to understand, she flashed out at me, and told me that I ought to be proud to serve her free, gratis, and for nothing, and that a true knight never hoped for any reward from his lady otherwise than an occasional smile and word of thanks. On the whole, I think that was the most outrageous statement I have ever heard fall from the lips of a human being; but as uttered by her it actually sounded rather splendid! It made me feel quite ashamed of myself, Philip. I said I was a mercenary brute,

and asked her to forgive me. This, after I had made an abject exhibition of myself, she ultimately did.

'For the next few months I had a pretty bad time of it. I loved her too much to keep away from her, but my self-respect was at zero. I had to put my pride in my pocket and undergo some humiliation nearly every day. To stand about for hours waiting for a dance, perhaps to have it cut in the end; to dash off parade and change out of uniform and gallop away to a riding appointment, perhaps to find that she had forgotten all about it; to be compelled to laugh and look amused when she said uncharitable things about my best friends—that was my daily round, Philip. Yes, they were stiff days, and I saw they would get worse. When you find yourself gradually ceasing to respect a woman without ceasing to love her, then you are in for a demoralising time, my boy.

'But I endured it all. I summoned up fresh stocks of patience and philosophy. I told myself that she was only a child, and a spoiled child at that; and that she would shake down presently. When she was a little older and wiser she would realise what humiliation she had often heaped upon me, and she would come and say she was sorry, in her pretty way, and ask me to forgive her; and I would do so, and we should live happy ever afterwards. Meanwhile I must

be enormously patient.

'Then suddenly, without any sort of warning, just as I was reaching the limit of physical endurance—there is a physical side to these things, Philip, as you may find some day-she capitulated, and we became engaged. For a fortnight I lived in the clouds. I gave her all the presents I could think of, and then sat down and unfolded to her all my dreams and visions for the future. I told her how proud the regiment would be of her, and what a splendid regiment we would make of it between us. I confessed to her, just like a penitent child, that I had been neglecting the regiment of late all on her account. Now that the suspense and worry was over, I meant to work double tides and make the old regiment twice as efficient as it had ever been. I told her I felt like a giant refreshed. With her beside me, there was no limit to things we might do with that regiment.

'Then Vivien (that was her name) interrupted me. She said, in her pretty, imperious way, "Joe dear, your regiment bores me. You never talk of anything else. In future I forbid you to mention it in my presence." Then she kissed

me, and took me off to a tea-fight.'

Uncle Joseph, who had been striding about the room during this narration, suddenly halted

and faced his nephew.

'Looking back now,' he said, 'it is plain to me that this was the point at which I ought to have made a stand. I should have taken Vivi firmly, and said to her, "My dearest child"

-Uncle Joseph's voice dropped to a gentle, caressing murmur, but he recovered himself with a jerk—" "understand this. A man's work is his life. It is his father and his mother, and his meat and his drink, and the air he breathes; and the woman who marries him must be prepared to stand by his side and see him through it, and not to hang round his neck and get between him and what he has to do. She must sympathise with him when things go wrong, and share his satisfaction when they come right again. If she grows jealous of his work and tries to detach him from it there will be a Therefore you must take me and disaster. my work together, or forswear us both, for they cannot be divided." That is what I should have said, Philip, for I knew it was true, even as she kissed me. But I didn't. I thought I should be able to educate her up to appreciation of my beloved regiment, and that her prejudice and selfishness would weaken in time.

'But I was wrong. It was I who weakened. I began by turning out less frequently at parade. I began to cut mess. I began to lose touch with the rank and file. Formerly it had been my pride to know the name of every man in my regiment, and something about him. Soon I found myself saluted by men on the paradeground whose faces I did not recognise. I began to listen to Vivien's criticisms of my officers. She sneered at my subalterns because some of them were hard-up and could not keep polo-ponies. She called them "a fusty lot"half of them had seen active service before they were twenty-one—and compared them unfavourably with the Viceroy's staff. She appeared to regard my affection for them as a sort of slight to herself. She looked down on my splendid little Gurkhas, and said it was a pity I could not get command of a white regiment. And I, instead of telling her straight that she must never speak in that way of my men again, began by making a few lame excuses for them, and ended by acquiescing in her opinions. I found myself patronising my own officers—some of the finest soldiers in the service—and drifting into an attitude of superciliousness toward soldiering in general. And all this, Philip, arose from that ennobling passion, Love!

'Then, when the hot weather came, she went away to Simla. I was to follow her in a month. During that month I came to myself again. I realised, once and for all, that a man's duty comes first in this world, and straightway I saw life clearly and as a whole once more. cloud that had settled over the regiment lifted again, and by the time I went on leave we were as happy a band as ever.

'I travelled up to the hills full of tremendous emotions, Philip. In the first place, I had not seen Vivien for over a month, and I was mad with the desire of setting eyes on her again. In the second place, I was determined to make it

plain that she must not attempt to come between me and the regiment again. It was a delicate problem to tackle, I knew; but I still hugged the delusion that she was only a child, and could be educated up to a wife's duties. But I saw a big fight ahead of me—a big fight!'

Uncle Joseph's voice dropped, and the light

of battle died out of his eyes.

'What was the end of the fight?' asked Philip apprehensively. He saw tragedy on the horizon.

Uncle Joseph laughed. It was not a pleasant sound. 'I need not have worried,' he said. 'There was no fight. When I got to Simla I discovered that she had been engaged to another man for nearly a fortnight.'

Philip shrank back into his chair, stunned.

'She had not even written to tell me,' continued Uncle Joseph. 'She had allowed me to travel half across India to see her, and then-People told me he wasn't a bad fellow-a bit of a boor, but a good sort on the whole. He was heir to a title of some kind, I think. I never saw him-or her-after the one interview. They were married about a month later.

'I went back to the regiment. I had that consolation, I told myself. Nothing stood between me and my work now. But I was wrong again. Nothing seemed worth while any more. Regimental routine wearied me to death, and presently I understood what had happened. In the old days I had loved the regiment because it was my regiment; latterly I had loved it because it was her regiment, and I wanted to make it a credit to her. Now that she was gone—cui bono? But I fought on. I would not give in. I was mechanical, but pretty thorough. I fulfilled every duty rigidly. The only difference was that whereas the regiment had formerly been commanded by a Damascus blade, it was now commanded by a broomstick, and it went about its work correspondingly.

'Then, three months later, came a letter from your father. He was dying, Phil—dying of a broken heart, if ever a man did. His story was the same as mine, only more shameful. asked me to take charge of you. Then I saw light; my duty lay plain ahead of me. I would go home and devote the rest of my life to protecting my nephew from the monstrous danger of Woman. I sent in my papers, came home, and took charge of you; and here we are! I

have spoken.

Uncle Joseph dropped unconcernedly back into his arm-chair, and relit the ashes of his pipe. But his fingers were shaking.

Philip sat still and silent for a long time. Then he asked, 'Was she very pretty, Uncle

'She was the most beautiful creature I have ever seen,' said Uncle Joseph simply.

Philip ventured on one more question, 'Is she alive now?'

Uncle Joseph shrugged his shoulders. 'I don't know,' he said. 'I have dropped so thoroughly out of the world that the social history of the past ten years is a blank to me. I have never heard of her since I left India. I do not even know her husband's title.'

Uncle Joseph turned to his nephew. A grim smile played about the ends of his moustache. 'And now, laddie,' he inquired, 'have I made things any again for you?'

things any easier for you?'
Philip flushed. 'What do you mean?' he

muttered. But he knew only too well.

'I mean this,' said Uncle Joseph. 'Has my story made it any easier for you to relinquish your acquaintance with the small siren of Hampstead Heath?'

It was the first great critical moment in Philip's life. Reason and Instinct—the truculent logic of his uncle and the gentle, chivalrous spirit of his father—fought for mastery within

him. Instinct won, and he replied doggedly, 'No. I'm sorry.'

'So am I,' said Uncle Joseph, rising to his feet again. 'However, you must be protected from yourself. Listen! You will drop your acquaintance with this little girl, and refrain from making any other friendships of a similar nature so long as you remain in my charge. It is an order. You understand?'

Philip bowed his head in silence. He had been brought up in a soldier's house, and when Uncle Joseph spoke in his orderly-room voice there was nothing more to be said on the matter.

That night, for the first time in his life, Philip cried himself to sleep. He had pledged his knightly word to keep tryst with a lady on Hampstead Heath the following afternoon, and now he would have to break it.

(Continued on page 101.)

THE SHARK-FISHERS.

By JOHN GLOSSOP.

WE who live upon the islands of Samoa never let pass an opportunity to kill a shark. The waters which surround our little world are infested by them; and sometimes a native will be caught and killed by one of the terrible man-eating monsters—quite frequently enough, indeed, to give a savage zest to the sport. It would be difficult to say whether even bird-catching occupies a higher place in the regard of any one of us. The natives are wonderfully expert and courageous, and as the flesh of the shark is the principal dainty at their great feasts, parties of men are for ever going in search of it.

The favourite time is when a storm has just blown itself out, for the sharks have been driven inshore, and may be found sheltering in great numbers under the black rocks that border the The men, who have rowed out in a frail cance, throw food overboard, piece by piece, and this serves the double purpose of attracting the sharks and gorging them so that they may be rendered easy of capture. The water around the boat quickly becomes alive with the brutes, and when the bait is devoured they retire to the shadowy waters where rocks overhang stretches of smooth sand, and there they lazily stretch themselves at full length, and sink into a half-sleep. The natives in the canoe paddle slowly along, and presently discover one of these sharks in drowsy slumber. The leader of the fishers raises his hand in signal to the paddlers to stay the course of the boat, and one man-generally a young and active fellowclimbs over the side into the water, and, with the noose of a strong rope of bark fibre in his hand, dives beneath the surface. Swimming quietly along under the water, he comes to a sleeping |

fish, and with a quick, deft movement slips the noose over its tail. Then, as gently as he came, he returns to the canoe; and when he has clambered safely back into it the natives take hold of the rope and rouse the shark from its sleep with a mighty pull together. The shark is dragged through the water before it has time to reflect, and in spite of its sudden panic and frenzied struggles, it is gradually hauled toward the boat. By keeping its tail clear of the water the natives have made it practically helpless; and at last, by a peculiar movement, they jerk it into the canoe, and a tremendous blow with a club finishes its career.

Sometimes the shark has backed into a crevice or hole in the rocks before it has settled down to sleep, so that its head alone is accessible. In such a case the diver will swim up to it, and with the utmost coolness tap it gently but firmly on the head. Sleepy and gorged with food as it is, and annoyed by the interruption, without knowing exactly the cause of it, the shark turns round with a swish in a space barely large enough for it to lie in. As it does so it exposes its tail, and the diver cleverly drops the noose over it and returns to the boat in the customary manner. For the sake of variety, I have seen a baited hook carried out by these natives, and dropped in about twelve feet of water, the line being then brought back to land. When a shark seizes the bait, and is safely hooked, the natives shoulder the rope at the edge of the water, and, singing a rude, measured chant, dance inland, dragging the fish into the shallows, where it is speedily killed.

The sport is exceedingly dangerous, as can be imagined; but we Samoans are taught to be as

much at home in the water as are the sharks, so that an astonishing indifference is displayed toward them. In some parts of the islands sharkfishing is regarded as being as much a trade as a sport, and the operations are carried out by a different method from those described above. The fishers tie a rope fifteen or twenty feet long around a small barrel that has been well plugged up and made watertight. To the end of the barrel is fastened a large steel hook, baited with dried fish. Several of these barrels, with rope and hook attached, are put on board a yacht, and a start is made for the noted sharkgrounds just outside the harbour. When the boat is fairly under way the crew become very excited by the anticipations of revenge and good trade, and break out into eager chattering, dancing, and barbaric song. On their arrival at the sharkground the casks and lines are thrown overboard about a hundred yards apart, and the yacht cruises round, awaiting developments.

Presently one of the barrels commences to rock up and down and dance at a great rate, sometimes disappearing under the water and reappearing at a distance. Then a boat is lowered, and its occupants row as rapidly as possible toward the floating barrel. Backward and forward, in circles and winding lines, the elusive cask is pursued, and only after a long period of hard rowing, sometimes for hours, is it captured and towed to the yacht, the hooked fish dragging after it as a matter of course.

Many times have I gone down with the natives to the beach when night has fallen to witness midnight fishing. The tactics pursued are now different, for the Samoans are full of resource. A line of great strength, three hundred feet long, is employed, with the usual hook and chain attached

and baited as described above. One end of the rope is tied to the wharf, and the well-baited hook is thrown a few yards away into a shallow pool in the middle of a patch of moonlit sand. Very soon a dark object is seen gliding like a shadow from the deep water across the sand toward the pool, and halting a few feet from the bait. We are, of course, all sitting as still as statues a little distance away, and we watch without the slightest sound the shark, after its momentary pause, move into the pool.

When the fish has made a meal it starts off back to the deep water again, and the rasping of the rope signifies to us that the hook is in its mouth. Then—and not until then—the men jump for the rope, and run with it a few steps in the opposite direction. I say a few steps, because the rope is generally torn out of their hands as the shark feels the hook and throws itself out of the pool in a mighty effort to escape from the cruel clutches of the hook. The shallow water is now cut into foam as the taut line is pulled through it, and the shark splashes with great fierceness and fights strongly for its life. The tugging men sway rapidly to and fro until their efforts are at last triumphant, and the shark is hauled up on the sand. Then a shot through the backbone where the body joins the head settles it. Sometimes the shark measures fifteen or sixteen feet; and there are times when a foolhardy native has stalked up to it in its deathstruggles and met with a misfortune similar to one I heard about a few months ago, when a fisher had a leg bitten clean off, and died from blood-poisoning within a few hours. But we are generally wise enough to keep out of the way of those great, murderous mouths, with their three regular rows of cruel teeth.

THE TILERIES STACK.

CHAPTER II.

HIS disturbed mind notwithstanding, Jimmie Bishop slept soundly in that best bedroom of Bidston's best hotel—so soundly that he was slow to respond when Miss Minnie Dart, the chambermaid, rapped at the door and melodiously mentioned warm water. But Minnie persevered, and the matured appearance of the sun-glow in the room through the yellow-brown blinds helped his feet to the floor. Memory's annoying sudden spur also did something in the matter.

He detained Minnie Dart from her other duties for nearly a minute, partly for business and partly for a little harmless frivolity, upon which his mercurial soul insisted.

'Yes, sir,' she replied, with perfect correctness of tone, when he began by suggesting to her that it was a beautiful morning.

'Well, then, see here, ducky,' he continued, knowing instinctively that the smile on her

side of the door was an honest pair to his, 'I shall require my matutinal repast, otherwise my breakfast, in half-an-hour precisely. I'm going to shunt off out of this by the first train. See?'

'Very good, sir,' said Minnie. 'And what shall I order for you?'

'Ah!' he exclaimed, striking a pensive attitude in his pyjamas. 'How about one of Corker's penny mixed-meat pies, some chitterlings, and a ha'porth of toffee—eh, Min? What little brats we were!' he added feelingly.

She begged his pardon, but not at once, being delayed by the trickle of soft laughter called forth by his words. Yes, to be sure, they were times, those remote days of infancy, when a penny to spend in Corker's bow-windowed shop by the school meant bliss for an hour, and when on frosty mornings she was wont to wipe Jimmie

Bishop's little nose for him quite as a matter of course on his whimpering way to school.

'Oh, all right; anything you like, dear,' he said then. 'Ham and eggs—anything. By the bye, you are somebody's very own dear, aren't you? You ought to be, if you aren't, Min. But I bet you are.'

'Yes, thank you, sir,' she replied truthfully, dimpling so charmingly that it was a pity the show was wasted upon a mere door-panel.

She waited for no more of such trifling, however, and went downstairs with a few rapid assumptions about Jimmie and Mary Ridley.

Poor Mary Ridley! Some girls had good luck with their sweethearts, and some the other thing. She and Mary were not what could be termed friends, but she could sympathise with Mary in such a heart's tragedy as this of hers. Mary's face to the world was amazingly brave and smiling, but she was bound to have her feelings like every one else. It was too bad of Jimmie—downright wicked, indeed—to come thus flaunting his success in Bidston's eyes for a night and a morning, seemingly with not so much as a kind word or thought for Mary herself, let alone a personal apology about his misconduct in London. And he had been such a nice little chap when he was a lad!

Meanwhile Jimmie himself had drawn those yellow-brown blinds, and, still in his pyjamas, plunged impetuously into the blue plush armchair by the hearth.

One glance at the Tileries chimney, very clear to view in the morning light, and he seemed a changed man. 'Confound it all!' he ejaculated, and fled to the arm-chair.

There, in an abject huddle, he nursed his chin and his cheeks, surrendering himself afresh, with remarkable weakness, to the tumult of visions and thoughts which he had taken so defiantly to bed with him. He had challenged them then to interfere with his night's rest, or his literary ambitions of the future, and his will-power had won well so far. But Mary's spell was upon him once more, and would not be denied. tried to mock it away. The revived details of that imprudent meeting by the chapel last night gave him strong help in the struggle. Mary's own gorgeous good sense, for example! If anything could stiffen his back, that ought. recollection of Mrs Ridley's simple old face under her black pagoda of a bonnet, and her childlike statement about his own dead mother's apparition in answer to prayer, raised a short scornful laugh in him. He followed it with a smile about Uncle Silas's money—compassionate as touching Mrs Ridley; dubious and faint almost to the vanishing-point when associated with Phiness Ridley. If Mary was to be believed in what she had said about his altered views of him, old Phineas's nature was apparently not so primitive as she had suggested. It wasn't easy to think of him as ready, indeed anxious, according to Mr Westcott, to wring his neck one day, and the very next willing, if not keenly anxious, to welcome him in the Hen Lane parlour for the indelicate reason put forward by Mary's mother. This brought his meditations in hard instant grip with the indelicate reason itself—Mary's inheritance from her uncle Silas. It brought him to his feet also, with a consciousness of the return of his mind's vigour.

'Bless the dear souls!' he exclaimed, with the light of dispassionate intellect—and that only—in his eyes. 'They're fine, all of them;

though how differently so!'

He began to dress resolutely. Time was flying, like the innocent white cloud-puffs against the blue backing of sky which told of a breeze outside. The nine-thirty express to town was on no account to be missed. The mass of his Bidston friends, with particular inclusion of Mr Westcott, might make what they pleased of his unreasonably rapid departure. They were quite at liberty to think well or ill of him; their opinion either way was nothing at all to him. Mary would understand, and that sufficed.

At length he was ready, and it only remained to pack his bag. But in the moment of turning for it he espied opera-glasses on the mantelpiece behind a discoloured plaster bust of Mr Gladstone.

These delayed him for three or four minutesimportant minutes they proved to be. The glasses were the very article he had longed for at intervals while he dressed. The Tileries chimney made continuous and stirring appeals to his imagination. A man was on its partially scaffolded summit, and the man could be no other than Mary's father. Jimmie yearned to see the old chap and his doings on that giddy perch more closely. He fully realised that the top of the chimney was the very best place in the world for Mr Ridley until the nine-thirty express had left Bidston's railway station. But his interest in Mr Ridley just then was almost purely professional. It was as an iron-nerved Titan that Jimmie gloated over him. Phineas was destined to appear as chief personage in yet another of his stories—as heroic steeple-jack this time.

The glasses served him excellently. He caught Phineas actually trying to light his pipe in the wind. He was brought face to face with the chin-beard and the scowl. He could fancy he heard the old chap swear as one match after another was tossed into the void. His attitude, bolt-upright and legs well spread, on the edge of his abyss, was as fine as the rest of him. Even so high up and half a mile away, he was a colossus; as forbidding in aspect, moreover, as Jimmie had ever deemed him, which was saying much.

The glasses showed Jimmie one more movement on Mr Ridley's part. The old man gave up striking futile matches and suddenly struck the air with his fist, then pocketed his pipe. He was obviously furious. And the next moment or so he drew a letter from his pocket and opened it out in the wind as if he were in a temper with it also.

But Jimmie had seen enough of him now. 'My goodness,' he said, lowering the glasses, 'what an ugly-looking beggar he is!'

He replaced the glasses on the mantelpiece, made a solemn and immediate descent to the coffee-room, and rang the bell.

Indiscreetly or not, the chambermaid had given the coffee-room attendant a hint about him; and this second young lady was very sprightly and encouraging in ministering to his needs.

But he was a disappointment to her. He said nothing clever or amusing; indeed, he declined to converse at all. His most spirited remark was 'Oh! is that so?' when she expressed the hope that the rather pronounced noise of trotting traffic in the street outside was not an annoyance to him.

'It's Riddington race-day, sir,' she explained; 'quite an affair in these parts, as perhaps you know. Every one goes who can. There'll be an extra lot from the Tileries this year, because of the strike. They've been out ten days, and opportunity is being taken to mend the chimney.'

Then came Jimmie's spirited remark; and he glanced at the girl so eagerly that she hoped she had broken his ice at last.

'Yes, sir,' she replied very brightly. 'There was a storm in March that loosened some of the stone-work. It did a great deal of damage in other ways, that storm did, in the district.'

other ways, that storm did, in the district.'
'Did it?' said Jimmie. 'Well, you may bring me my bill. And don't fuss around any more, please. I've got things to think of, and you bother me. See?'

She saw reluctantly, and obeyed. He paid the bill, gave her a shilling for herself, and that ended their intercourse.

A few more minutes, and the purple hat was on Jimmie's head and his intentions were again 'set fair' for London. He had shaken off the temptation to return to Hen Lane, which was in truth the engrossing chief of his thoughts while he breakfasted. Phineas being on the chimney made the temptation a strong one. No practical good could come of falling a second time in twenty-four hours into such temptation; yet for a while he craved the refreshment of one more smile from Mary's dear eyes as passionately as if his life's best stake depended upon it. The folly of such an indulgence declared itself in ample time to save him for his train.

A 'farewell' to the chambermaid, and he was off. He returned to his bedroom and rang expressly for Miss Dart; nor could her professional veneer of demureness withstand for more than an instant the smile with which he received her.

'Did you want me, sir?' she asked at the threshold, duly formal, but dimpling hugely.

'Only to thank you for your services,' he told her, with a disgusting air of importance; 'and,' he added softly, pressing a sovereign into her hand, 'to give you my blessing, Min, with this. See you again some day, I hope; in heaven if not in Bidston. Good-bye, dear.'

'Oh Jimmie, you mustn't!' she breathed to

his departing back at sight of the gold.

He turned at the stairhead and shook a frolicsome finger at her; whereupon a spirit of comedy akin to his own straightway prompted her to drop him a curtsy of sorts, and to say in an ordinary tone, 'Good-morning, sir, and thank you very much indeed!' as if he were nothing more than an exceptionally generous visitor going his way.

A ceremonious London bow for the young lady in the office downstairs, and Jimmie stepped into the street.

He had still plenty of time for the train, with a little to spare for sociability if he cared to make amends this morning for his cavalier treatment of his old friends a few hours ago. plans were quite otherwise. Instead of going to the station, he turned into a side-street, designing to zigzag to his destination, and thus avoid Messrs Perry, Griffin, and his other mercantile acquaintances. He was especially undesirous of meeting Mr Westcott, as might befall him in the main street. Even two minutes' conversation with that gentleman would, he felt positive, be more than enough to take the cheer out of his imagination for the rest of the day. And this would not do at all, inasmuch as he was determined to coax some good fruit from that fine faculty during his journey to town. Paper and fountain pen aiding him, he did not doubt his ability to succeed in the matter if he were not disagreeably crossed in the meantime.

Therefore he hurried down Harris Street, bent round Prospect Crescent, a curve of cheap red tenements for miners and others who liked an extensive view of pit-banks and a flaming ironwork on the horizon, and ought then to have veered to the right toward Canal Street and the goods-yard of Bidston's station.

But in fact he had not passed half the houses of the Crescent when he stopped. The Tileries chimney was visible here from base to head. It lured him more strenuously than ever.

He stood and gazed at it, and then made straight for it across the intervening jumble of olive and black pit-mounds and depressions with shining little pools in them.

Old Phineas was still plainly apparent on the top of the pile. The iron stairway by which he climbed to his giddy perch was also distinguishable. He could not return to earth without being seen by Jimmie. Probably he would stay where he was for a considerable while yet. But, whether he did or did not, there would be abundant time for Jimmie to achieve valuable inspirations, impressions, and so forth at the chimney's mighty base. These stored, he would trudge on a farther mile to the railway station

of Hoxley Fields, bagging other patches of local colour and perhaps an uncouth but telling adjective or two from local mouths, all for his note-book. His trifle of hand-luggage would not trouble him much even if he had to carry it the whole mile himself. And at Hoxley Fields he would get a stopping train for Birmingham, and so to town by a different yet excellent route, without again approaching his dear but inconvenient friends of Bidston.

The first part of his plan fulfilled itself quite simply. He skirted the vast hollow from which the Tileries Company extracted the clay for its manufactures, and again, as in the past, it reminded him of a print of Dante's 'Hell.' he shuddered also as he thought of Phineas up above and this terraced pit some three hundred more feet below the stack's base. It seemed near enough to the chimney to be plumbed in a flying leap from the summit; yet Mary's father could light a pipe, or try to, and read his letters erect in a high wind on the edge of this terrific chasm as calmly as if he were in his Hen Lane kitchen, with his large feet comfortably on the

The Tileries gate was ajar, and Jimmie entered the premises. A man sitting on a barrel by the weighing-machine just inside casually touched his cap to him.

'Good-morning,' said Jimmie. 'All on your own, are you' No objection to my looking round, I suppose?'

'None at all,' said the man.

'I happen to know Mr Ridley. You others are all at play, it seems?' Jimmie proceeded

Darn sight little play about it,' retorted the man, with a sudden rise of his temperature. 'We ain't at work, if that's what you mean.'

'Same thing, I expect,' laughed Jimmie, and

moved on for the chimney.

He spent five useful minutes alone at its base, note-book in hand. Though fascinated and busy, he was vigilant throughout. But Phineas was never in sight here. The head of the stack had a massive overhanging cornice, to pass which the ladders made a forward bend to the slim scaffold which supplied the stack with a temporary halfcollar higher still. Thus Phineas was completely hidden on the summit. Nor did he show at all on the ladders.

A footstep then made Jimmie look round, and a boy with the postal badge on his arm approached him.

Telegram for Mr Ridley, sir,' said the boy. Jimmie smiled and pointed his pencil up the

'Not me, sir,' said the boy, shaking his head. 'Mrs Ridley sent me on with it, because it's a special, she said; but I'm not goin' up there.'

He had a little more to say-about Mrs Ridley's opening the telegram, and then making it fast again in its envelope with stamp-paper, and giving him sixpence to bring it on to the Tileries.

'I can't do more than this, though,' he concluded. 'It's no use hollerin' up to him, is it, sir? The bloke in charge says you're a friend of his. Perhaps you'll be waitin' till he comes down, sir?'

A great commotion had started in Jimmie's mind during the boy's prattle. Twice his head tilted back slowly as his eyes ranged above those little vertical ladders climbing heavenward like the fabulous bean-stalk of the fabulous Jack. He was rather pale—from excitement mainly. But when at length he held out his hand for the telegram, it was with a smile of remarkable composure. 'I'll see that he gets it,' he said.

'Oh, thank you, sir!' exclaimed the boy. 'Go

up yourself, sir, will you?'

'I'll think about that,' said Jimmie.

The boy had been gone about a minute when he brought his courage quite to the requisite Even then he was far from sure that he could do it. But, for two or three reasons, he meant to try.

At the best he might get as far as the cornice, and there make himself heard by Phineas. He would deliver the telegram to the astonished giant at that junction of the deadly and the merely dangerous, and then descend as fast as he safely And at the worst—if his pluck failed him in the first hundred feet—he would feel his way down again with his eyes shut. In either event, his sensations would be of the most valuable first-hand kind for his pen's use in the future.

There was a shed near, and he deposited his hat, umbrella, and bag in it. Then he returned and took his first steps skyward.

CARTHAGE. ROME AND

A STRUGGLE FOR SUPREMACY.

By R. W. CLOKIE.

PART I.

HE history of the struggle between Rome and Carthage is one of considerable interest. It is the story of the life-and-death struggle

our minds back to a remote period of history. It is crowded with incidents of life and vigour which reveal the genius and character of one at between two nations of antiquity, and carries | least of the giants of the past. We cannot read it without perceiving the impassable gulf which separates the Roman period from the present, a consciousness which increases our interest and develops our imagination. On these grounds alone this contest is worthy of our attention; but the fact that it was the turning-point in the fortunes of Rome gives it a far deeper significance.

To the student of history Rome stands for so much that is pertinent to the growth of our Western civilisation! The recorded history of our own country begins with the occupation of Britain by the Romans. The same may be said of many of the Continental countries; indeed, modern Europe may be said to have grown out of the ashes of the Roman Empire. Any crisis, therefore, which touched the fortunes of this great precursor of nations must be of considerable interest to the modern.

To the Romans and the Carthaginians of the third and second centuries B.C. the Punic Wars were wars of conquest only; to us they were wars which directed the course of our own history, and added to the character of our civilisation. Though the civilisation of the Western world is far from perfect to-day, there are some grounds for saying that it might have been less perfect if Rome had not been able to drive Hannibal from Italy in the Second Punic War; for great is the debt of culture and refinement that Europe owes to Rome, and the benefits which followed the march of her legions can hardly be overestimated.

We realise the fact of Rome most, perhaps, when some piece of Roman pottery is unearthed in our island, or when some coin bearing the image of a long dead Cæsar is put into our hands. But a moment's consideration of the many words in the English language having Romanic derivation will reveal better than anything else the lasting impression that Rome made on the nations she conquered. Of all the Roman provinces, Britain perhaps felt the direct force of Roman culture least, being, as she was, the province most remote from Italy, the one last to be added to, and the first to be abandoned by, the Empire. Indirectly, England has enjoyed all these benefits by her proximity to the Continent. Diffused over so large an area, and for so long a period of time, this Roman culture so grew upon the nations which came under its influence that it became strong enough to survive the nation which produced it and the military system which upheld it.

It is a remarkable fact that the most lasting benefits of the Roman occupation of Europe were those to which the Roman himself gave the least heed. It mattered very little to the Roman soldier that he was teaching the barbarian, by example, the value of discipline and law so long as he was loyal to the legion in which he fought. The Roman governor thought far more about the taxes he squeezed out of his province than about the comparatively high standard of living

which his officers and retinue set up before the rough provincials. The Roman emperor got more satisfaction from the thought that he had added another province to his empire than from the thought that he had brought another nation into touch with the refining influences of the Roman civilisation. It was no spirit of altruism which sent Cæsar into Gaul and Britain, but rather the less virtuous ambition of national aggrandisement. The Roman lives in our memory more because he has a place in our literature, language, and law than because of his high place in the annals of history.

Rome had a genius for war, for colonisation, and for government. Through this genius she was able first to conquer and hold, then to colonise and govern, a very large portion of the world known to the ancients. It is because Rome had these qualities better developed than her rival that the student attaches importance to the issue of the Punic Wars, and inquires with great interest into the social condition of Carthage. No other nation brought Rome nearer to the brink of ruin. During the Second Punic War the eclipse of Rome was more than probable. Twice, at least, her independence was in extreme danger.

Who, then, and what was this nation which brought Rome so low, and barred her progress for so long?

Comparatively speaking, we know little about the early history of Carthage. What we do know has been told us by her greatest enemies. The Greeks and Romans, her hereditary foes, were her historians, and her memory has been blackened by the hatred these nations bore her.

When the Israelites shook off the captivity of Egypt, and determined to take possession of the 'land flowing with milk and honey which the Lord should give them,' the patriarch Moses, under the inspiration of Jehovah, exhorted them to slay without mercy all the opposing Canaanites, because they were an idolatrous people and worshippers of Baal. Perhaps Moses little realised what a wonderful race he was so anxious to exterminate, and perhaps the world at large is to be congratulated that this extermination did not proceed as rapidly as the Israelites desired. For the debt we owe to these Canaanites (or Phœnicians, as they are known in profane history) is considerable. It was they who, first learning them from the Egyptians, introduced to so many nations of antiquity the rudiments of our own written characters, the foundation of all intellectual development. They were the pioneers of shipping and commerce, and had learned to steer their ships by the Pole Star while the Greeks still depended on the Great Their restless activity and genius for trade impelled them to brave the mysteries and dangers of the ocean, and to steer their barks into all known waters of their time. They swept the Mediterranean with their shipping,

and there is hardly an island in that great sea that has not yielded Phœnician coins and inscriptions, or does not retain Phœnician names and legends to attest the energies of these indomitable traders. They dotted the southern coasts of the Mediterranean with trading factories, even as far as the Pillars of Hercules. From the natural advantages of locality, one of these factories, in this case emanating from Tyre, was destined to outstrip her sisters and become the Queen of the Mediterranean and the great rival of Rome.

Such was the origin of Carthage, and as such she emerges out of the obscure past. Very fitfully she creeps on to the page of history. Founded nearly one hundred years before the traditional date assigned to the founding of Rome, she is absolutely unknown to history for the first two hundred years of her existence. Then follow three centuries of wars with Syracuse, during which Carthage slowly but surely established her power in Sicily. She extended her domains in Africa and colonised Corsica and Sardinia. Trading first, and fighting more from necessity than preference, Carthage rapidly grew till she became the mistress of the seas and the master of Africa.

Carthage was pre-eminently a trading nation, and, like Tyre and Sidon, her parents, she loved peace. For her military protection she relied on mercenaries, of whom her army was for the greater part composed. These facts largely explain her rise and subsequent decline. Though the practice of employing mercenaries left her citizens free to trade, a paid mercenary is a poor substitute in a time of national emergency for the patriotic soldier fighting for the freedom or honour of his native land. During the interval between the First and the Second Punic War her mercenaries rebelled and almost subverted the State.

Of the domestic history of Carthage we know little, of her art and literature less. That there was a library in Carthage is certain, but little is known of the books it contained. One work survived the ruin, and, being translated into Greek and Latin, became the standard authority on farming.

The religion of this nation was idolatrous, and encouraged rather than checked immorality. They worshipped Baal, the god of fire, who delighted in human sacrifices. Melcarth, known among the Greeks as Hercules, was their tutelary god. Ashtaroth and Dagon the sea-god had prominent places in their mythology.

Mommsen, the German historian, says that the Phœnicians lacked the art of self-government. The Carthaginians, no doubt, inherited the same weakness. Their integrity broke down through an inaptitude for government in all classes. There were no revolutions, either from above or below, in Carthage. Money was allpowerful. The offices of the State were bought and sold. The government was a close aristocracy, which became corrupt.

It has been laid down that the great weakness of the Carthaginian was his inability to assimilate himself to his surroundings. Add to this the unimpressiveness of the native African, and we may have some explanation why Carthage was unable to attach to herself her dependencies so deeply as to make her total destruction impossible.

The little that is known of this remarkable nation and its brilliant, though transient, civilisation makes it a matter of regret that the jealousy of Rome was not satisfied with something short of its annihilation. But that little is sufficient to show that Carthage could never have done for the generations which followed her what her conquerors have done. It is neither generous nor wise to pass sweeping condemnations on extinct races; but there are some grounds for saying that a universal Carthaginian Empire, such as Hannibal dreamed of and the Romans obtained, would not have melted down national antipathies, would not have bequeathed a common language and literature to her dependencies, would not have paved the way for so high a civilisation and so pure a religion as did the Roman occupation of Europe.

THE FIRST PUNIC WAR (264-241 B.C.).

The middle of the third century B.C. found Rome in the condition of youth bordering on manhood, full of life and vigour, of courage and resource, eager to be up and doing, yet tainted with that timidity born of powers that have not been fully tested; a condition in which success is more elevating than failure is depressing. Roman legions had never before this period waged war outside their own peninsula. Rome had subdued the minor kingdoms around her. She had driven north the savage Gaul; she had expelled the powerful Pyrrhus from her shores; but she had never left her native shores to attack a foreign Power. Rome, therefore, hesitated before she attacked a nation with the fame and prestige of Carthage. This diffidence caused her, when once committed to the war, to exert every effort, to strain every nerve, to conquer. No labour or sacrifice was too great in order to ensure success.

The position of Carthage was different. Carthage was just one hundred years older than Rome. Her civilisation was more advanced, and already the signs of decay were apparent in her constitution. Though still powerful, Carthage had lost that vital spark which makes a nation all-powerful; her two great advantages, a firm footing in Sicily and an unrivalled supremacy on the sea, were insufficient to counterbalance the young, hot vigour which Rome brought into the struggle.

It was the relieving of a small garrison in an obscure town in the north of Sicily which precipitated the struggle which had long been brewing. The signal success of Rome here led that nation to push farther her advantages; and before she was well aware of it Rome was grappling with the great power of Carthage.

It was the policy of Rome to sweep the Carthaginian from the island of Sicily; and for three years she struggled toward this end, and had so far succeeded that the Carthaginians were confined to a few fortresses on the west coast of that island, when it suddenly dawned on the mind of the Romans that they would never drive the Carthaginians from Sicily until they had destroyed the Carthaginian fleet.

Now, Rome had no fleet. She was not a maritime nation. The Roman soldier feared the sea; but, with an enterprise to which there is no parallel in history, Rome set about building a navy to meet the most powerful naval force in existence.

The Carthaginian ships of the line were those monster five-decked galleys known as quinqueremes. Though Rome might hire from the Greek cities in Italy the smaller triremes, these vessels would prove powerless against the bulky quinqueremes. Fortune came to her aid in the form of a Carthaginian quinquereme wrecked on the shores of Bruttium; and we are told that from this model Rome built one hundred ships of the line and twenty triremes in sixty days.

A life-and-death struggle will always bring the best out of a nation, and bring to the front all the military genius it possesses, but it is rarely capable of turning a nation of landlubbers into a nation of seamen. This building of a navy in sixty days was a stupendous task, and calls for the highest admiration; but it does not require the exaggeration of the ancient historian to enhance its value, nor were the Romans so ignorant of seamanship as to justify the ludicrous picture of a hundred batches of would-be sailors training themselves to row on scaffolds erected on the sands.

The Roman soldier was pre-eminently a land fighter. He trusted to the muscle of his right arm behind a stout broadsword. He could never hope in a few months to equip and train a navy capable of outmanœuvring such experienced sailors as the Carthaginians; and perhaps it was the clumsy but effective device by which he turned a naval action into a land action which best illustrates the Roman adaptability and genius for invention.

On the forepart of each vessel was erected an additional mast, and lashed to it by a powerful hinge was a species of drawbridge. On the end of this drawbridge was a sharp spike of the strongest iron, and its resemblance to the bill of the raven gave the name of corvus to the whole construction. The corvus could be swung from right to left at will.

This simple device won success for the Romans

in the first naval engagement of these two nations. In the battle of Mylæ they defeated the Carthaginian fleet. As the two fleets approached each other the Carthaginians must have viewed the clumsy Roman galleys with ill-concealed amusement, built as they were of green, untempered wood, roughly knocked together, and badly manned. The strange gear hanging over the forepart of each vessel, too, must have excited the surprise of these cunning Phœnicians.

The Roman fleet, however, made bold with the knowledge of its secret, maintained its course and order, and headed straight for the enemy. The impact came. The vessels shivered from stem to stern and remained stationary for a moment. In that fraction of time the corvus was dropped, and its beak perforated the deck and held fast each proud Carthaginian vessel; and before the Carthaginians realised what had happened, and as the ships swung to in their deadly embrace, the Roman soldiers had rushed across the drawbridge, sprung over the sides of the galleys, and swarmed on to the decks of their enemies. The naval action had suddenly been turned into a land action, and the Romans fell upon the surprised and disorganised mercenaries, and the battle was won. Some fifty Carthaginian galleys were captured, and the rest took to flight.

The importance of this victory to the Romans was not so much the immediate result as the omen it gave for the future. The hope it aroused in the Roman was only surpassed by the dismay that filled the Carthaginian. The interval of four years between the battles of Mylæ and Ecnomus was one of great naval preparation. Both nations devoted all their energies to building fleets large enough to make the next engagement decisive. The mere weight of numbers gives the battle of Ecnomus a conspicuous place in history. Probably never, either before or after, did such vast naval armaments put to The Romans set sail from Messana with three hundred and thirty ships, and the Carthaginians with three hundred and fifty. From the deliberate calculations of Polybius, who assigns three hundred rowers and one hundred mariners to each ship, we gather that nearly three hundred thousand men were engaged in this battle.

These huge fleets met in 256 B.C.; and though the Carthaginians were more wary, fearing the dreaded corvus, the Romans had so far improved their naval skill that they gained another complete victory, only a few of the Carthaginian ships escaping.

The victory of Ecnomus opened the door of Africa to the Romans, who lost no time in transferring the war into the enemy's country. So prompt was this invasion and so unprepared were the Carthaginians, their army being engaged in Sicily and their fleet destroyed, that had Manlius, the Roman consul, marched direct upon Carthage the Punic Wars might have

ended here. But it was not so. A rich tract of country stretched between Manlius and Carthage, and this proved too tempting to be ignored by his army. The Roman, still a stranger to luxury, contemplated with amazement and delight the pleasant gardens of the opulent merchant princes of Carthage, and wasted precious time in plunder. Palaces were ransacked and fired, cattle were driven into the Roman camp, and thousands of the inhabitants were sold into slavery. Such was the policy of war among the ancients. Nevertheless, the African campaign developed into a progress of victory. Village after village, and town after town, having no protecting walls, surrendered on the approach of the legions, and the Roman army covered itself with glory.

The recall of Manlius, in accordance with regulations of the army and the expiration of his command, gave to the Carthaginians just that opportunity they needed. The arrogance of Regulus, who was left behind with a mere handful of soldiers, stung the Carthaginians into one more effort for liberty. They quickly collected an army, strong in its cavalry and its one hundred elephants, and fell upon the over-confident Romans, who at the battle of Addis suffered their first defeat in Africa. This victory of Addis reversed the fortunes of the war, which

was at once transferred into Sicily.

The vicissitudes of the war from this point were remarkable. The honours were more evenly divided. On sea the Romans suffered more from storm and tempest than from their enemies. Three fleets were successively shattered on the rocky coasts of Sicily. On land they continued to mew the Carthaginians up in a few strongholds of the island.

It was more by dogged determination than by brilliant tactics that the Romans gradually undermined the power of the Carthaginians. Both nations had begun to show signs of exhaustion when it became evident that the struggle

must soon end.

At length all efforts culminated in another naval action fought off the Ægatian Islands. Hanno, the Carthaginian admiral, was conducting supplies of corn for the relief of the garrisons in Sicily when the Roman fleet attacked him. Fifty of his ships were sunk and seventy captured. This naval victory of the Romans ended the First Punic War. Terms of peace were agreed upon, which stipulated that Carthage should remain an independent nation, but must evacuate Sicily, restore prisoners, and pay a large war indemnity.

The First Punic War cost the Romans seven hundred ships and seventy thousand men, besides the thousands killed in Sicily and Africa. Carthage lost seven hundred ships, mostly filled with mercenaries, whose loss the callous Phœnician might view with indifference. The apparent gain to Rome for this enormous loss of life and

energy was the devastated island of Sicily, now drained of everything which made it worth having, its territory ravaged, its population swept away, and its towns destroyed. A poor Against this superficial view of the results of the war we suggest another.

In the great evolutionary progress of the world the life-and-death struggle is everywhere in evidence. There are two sides to this struggle, which will always be at variance: the temporary calamity and distress caused by it, and the future more lasting effects resulting from it. The present always suffers for the future. Future benefits must always justify present hardships.

This view of the First Punic War being taken, were the results confined to the occupation of Sicily by the Romans, or the payment

of a war-tax

If the Roman nation was accumulating great energy and cultivating an indomitable spirit, qualities of a strong free race which can only be acquired in the most strenuous conflicts of life, then the distressful calamities of even this war were justified. Had Rome not possessed the national pride, the ambitious spirit, the greed of conquest which would be satisfied with nothing short of the destruction of Carthage, she would never have had the opportunity or the force of character to conquer and colonise the future Roman Empire, nor would she have been able to impress upon the races of Europe a civilisation out of which our own has grown.

In the First Punic War two great nations met and struggled for mastery. In that struggle the nation most fit for empire shook herself more free of the circumstances which confined her, expanded and breathed more deeply, got a firmer grip of life, and considerably prepared herself

for a great future.

A GIRL I KNOW.

My sweet is like a happy garden bed That meets the loving south; June's warmest sunshine ripens on her head, Its cherries on her mouth.

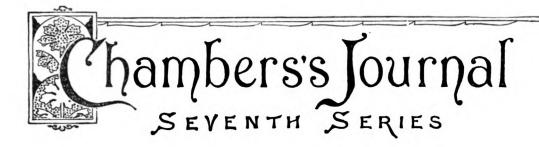

Her smile is like a tender sky that leaves All sorrow blest and shriven; Her blush is bright and wonderful as Eve's When earth's first kiss was given.

Her eyes are waters innocent and clear, Blue deeps without a shoal;
None ever knew their gaze and felt a fear
To trust her with his soul.

Her presence beckons to a gay repose,
A clime where all are kin; She meets you at some gentle turn she knows, And leads your spirit in.

Her heart is home to every need and right; God made her pure and strong: He loves her as He loves the rosy light That breaks in dew and song.

CANON LANGBRIDGE.

THE CHINA COAST.

By J. G. SMITH.

IN the Royal Navy it is customary to speak of the Australian, Mediterranean, and China stations. To the man in the street these phrases are intelligible; he knows that in Sydney, Malta, or Hong-kong, as the case may be, different units of our navy have their headquarters. In the merchant service these stations have their synonyms in the Australian coast, the Mediterranean trade, and China coast. But unless the man in the street is connected with shipping, the meaning of these terms will be very vague to him; and as China is likely to figure prominently in his daily newspaper for some time to come, I propose in this article to try to enlighten him as to what one of them-namely, the China coast-really means.

Unlike the navy, where the personnel is changed every three years, the China coast means home to the officers working out there; and as Shanghai and Hong-kong are the 'home ports,' there they live and have their being, varied in the course of a lifetime by three or four trips to the Old Country. The two principal British shipping companies on the coast are Messrs Butterfield & Swire (China Navigation Company) and Messrs Jardine, Matheson, and Company (Indo-China S. N. Company). 'B. and S.,' as the former company is generally called, although the younger firm, control about sixty ships; while Jardines have only about forty. Shipping, however, is not the only string which these large firms have to their bows, Jardines being agents for machinery, cotton-mills, wharves, and sugar houses; while B. & S. do a large insurance business, run a sugar refinery, and control the biggest dock in the East.

Every British ship on the coast has at least six Europeans on board—a captain, two officers, and three engineers. The deckmen are a cosmopolitan lot from all over the British possessions; but the engineers are Scots almost to a man, Greenock and Dumbarton claiming most. Should the English 'man in the street,' then, in either of these two places overhear a group of old dames discussing the current exchange of dollars, taels, or rupees, he need not marvel at the ramifications of Scots finance; they are only bewailing the fact that what was ten pounds last month is only nine pounds this. The firemen and sailors are, of course, Chinese; hailing from Ningpo in

No. 164.—Vol. IV.

the case of the Shanghai ships, and Canton in that of the southern ships. In the old days, on the coast, the Europeans employed were, according to the many stories still current, a 'hard case' lot, derelicts from the Royal Navy and the great companies, and any Vanderdecken individual in search of pastures new or the spice of adventure supplied by the continuous troubles of China.

Now all is changed, or changing very rapidly. Conditions of life on the coast have improved so much that the China 'coaster' has evolved into quite a respectable citizen. He looks for advancement in his company, not for an opportunity to get out and become a general in the Chinese army or political adviser to some viceroy, as in the cases of Generals Ward and Mesny. At all events, he would look in vain nowadays, for all Government positions are watched with a jealous eye by Young China. However, if he likes to stake his life for a good round sum, no doubt numerous opportunities will occur, as they have occurred in the past. The late Captain Cox, who ran the blockade into Port Arthur, was a case in point; and another occurs to me which is too recent to mention.

The only other British shipping firm of any consequence is the Douglas Steamship Company, who own three or four fine ships running between Hong-kong, Amoy, Swatow, and Foochow.

There are also a few Chinese-owned ships flying the red ensign; but the Norwegians alone seem to compete successfully against the British firms, and even these often disappear during spells of slack trade. Numerous Macao and Canton river-steamers also fly the British flag, although most of them are owned by Hong-kong The flag, however, does not afford much protection, as was shown last year, when one of these ships was held up by pirates, and the chief officer shot dead, while the captain was seriously wounded. Iron doors are now fitted to most of the rooms on board, and he is a very optimistic man who does not sleep with a loaded revolver and rifle handy.

The only serious rival to British shipping on the coast is the China Merchants I. N. Company. This concern is purely Chinese, and has always had the support of the Government; but notwithstanding this its trade has not expanded

[All Rights Reserved.]

JANUARY 17, 1914.

much, for its operations are still principally confined to the run between Tientsin and Shanghai. Its ships are officered by Europeans, mostly Scotsmen; and until very recently two well-known Scots, Mr Weir and Mr Clements, held almost undisputed sway in its Shanghai office. Certificates are not required under the Chinese flag, but the 'ticket' has generally been insisted on for those seeking employment under it.

Several more or less abortive attempts have been made by the Shanghai Chinese to get into the coast trade, but they have either failed or are hanging on in a very shaky condition. European officers and engineers are always employed, but their power is so curtailed that it is impossible for them to interfere with the robbery which goes on under their noses. In Chinese concerns the ship's compradore or purser really runs the ship; and he, as is always the way with Chinese, is either a brother or other relation of everybody in the office. The consequence is that the family do very well, and the shareholders get next to nothing. They may get an occasional 'little chance' or dividend when they become too restless; but most of the time they have to be content with the 'face' acquired by being part-owners of a steamer, and free tickets when they travel.

One Chinese firm—namely, the Ningshao Steamship Company—seem to be doing fairly well. They run two steamers between Shanghai and Ningpo. This is almost entirely a passenger run, and their largest steamer, the Ningshao, being fairly speedy, can easily beat the British opposition vessel—a fact which gives the Chinese passengers on board an immense amount of satisfaction; they turn out at all hours to see the 'walk' past, and always contrive to let a European passenger know that the Ningshao was built in China (at Foochow, under French supervision). This company is quite up to date in its advertising methods. Last year hundreds of fans were given away. 'China for the Chinese,' 'Support home industry,' 'Why travel in the slow foreign steamer?' &c., being written on them in the floweriest of Chinese.

The company also, like most of these Chinese concerns, employs British officers. It will thus be seen that not only does British capital control the coast trade, but British officers seem to be preferred by the Chinese to those of any other nationality. This preference does not necessarily mean that they love us any better, but may be accounted for by the fact that English is the Esperanto of China. Sailors and coolies always 'let go' and 'heave away' in English, much to the disgust of patriotic Germans in steamers of the Fatherland.

The Germans do not appear to be able to make much headway on the coast; and, outside of the Nord Deutscher Lloyd and the Hamburg-

America Lines, German officers are very scarce. The Nord Deutscher Lloyd operates a line of steamers running between Swatow and Bangkok; but, strange to say, an English shipping firm are their agents. This line formerly belonged to the Scottish Oriental, but they had to sell out about ten years ago, when it was bought by the Germans in the hope of getting a footing on the coast. Every ounce of cargo carried thus passes through British hands, a position of affairs which causes our German friends to exercise a great deal of that philosophy for which they are justly famous. This peculiar predicament of a subsidised German firm was the cause of a question in the Reichstag not long ago.

The Japanese, too, despite all their talk of 'brotherhood' and 'kindred race,' are looked at askance by the Chinese shipowner. They have one small regular line of steamers running in opposition to the Douglas Company. Whether it pays or not is a very open question. The coalcarrying trade, however, is practically in their hands.

Writing of the Japanese recalls the fact that the British officer has almost vanished from their merchant service. Only in a very few of the larger steamers is an occasional British master seen, and his lot is not a happy one, as any of them will tell you. They are only retained to facilitate the entering and clearing of the ship at ports where complications with the Customs are likely to happen. Their authority on board is practically non-existent. It appears to be characteristic of all Asiatics that only when the heavy hand of the law—as in their armies and navies—can be used will they maintain that discipline necessary to ensure smooth running. Any one who has travelled in a Japanese or Chinese merchant ship

will realise the truth of this.

An extraordinary trait of the Japanese is the loyalty with which every individual will carry out the orders of the Government. For instance, at Dalny, during the plague in Manchuria, almost the first words spoken to a European on arriving were, 'We have not the pest;' this despite the fact that entrance to the city was barred, and isolation camps could be plainly seen from a ship's bridge.

European residents in the East are inclined to a very fervid dislike of the Japs, and with good reason, too, when one contrasts their one-time old-fashioned courtesy with their present-day swagger and assertiveness. The change since they defeated the Russians has been very marked, and affects the 'coast' officer much more than the European living ashore at Chinese ports. The sailor being in constant contact with the lower or coolie class of Jap, the knowledge is unpleasantly brought home to him that a few frock-coats and tall hats do not make a Western civilisation.

The heavy taxation which the Japanese suffer

as the price of their ranking amongst the Powers has no doubt a lot to do with this. A Customs officer getting forty yen (four pounds) per month informed the writer that his income-tax alone amounted to one-twelfth, or one month's pay, per annum. Possibly if we were mulcted to this extent we should treat those responsible for it with scant courtesy.

Fair-play is not the strong point of our 'little brown brothers.' They have contrived to maintain friendly diplomatic relations with us, but have taken advantage of the slowness of our Government in moving to harass the individual Britisher or British firm past all endurance.

A propos of the spy scare, rather an amusing contrast between our methods and the Japanese methods of dealing with 'spies' occurs to me. Recently a party of Japs, under a leader who was afterwards found to be a major in the Japanese army, were caught in the act of looking for a back-door into Sydney, New South Wales. Despite the fact that they were qualified surveyors, and in possession of every modern surveying instrument, they were simply warned off, ''Nuff said.' and allowed to depart in peace. Two harmless Scots engineers went for a stroll at Hakodate, in the north of Japan, and in the course of their rambles wandered aimlessly into a prohibited zone, where they were promptly arrested and touched up with bayonets to make them hurry to a guard-room. Here their names, occupations, places of residence, and date and hour of birth were taken; but as one said that he came from 'Ru'glen' and the other that he came from 'Mulguy,' and as the Japs could not find either of these places in their geographical index, this was held to be highly suspicious, and accordingly our compatriots were blindfolded and marched up and down military roads for a matter of twelve hours. Meanwhile every telegraph line in Japan was red-hot with 'Ru'glen and Mulguy.' At last the British consul was appealed to. interpreted, and explained to the satisfaction of everybody, especially our friends from Ruther-glen and Milngavie. This is not a 'funny story,' but the actual truth, which any one who does not value his life much can verify by asking the two Macs concerned.

The carrying of Japanese coastal cargo in any other than Japanese vessels has long since ceased, including the cargoes that British ships used frequently to carry from Shanghai to Korea. The pressure brought to bear on Korean merchants to bring this about must have been very great, for the Koreans detest the Japanese with a bitterness quite understandable under the circumstances.

In view of our own labour troubles at home, it is very interesting to watch the trend of the problem in the East. In Japan the Government steps in and squashes strikes at their inception; but signs are not wanting that trouble is coming, and it is very doubtful whether such high-handed

methods will be practicable for long. Where every man is either a trained soldier or sailor, it behoves a Government to go very warily lest it should be hoist with the engine it has been at such pains to construct. That the Japanese workman is a very hardly 'entreated brother' there cannot be two opinions. He is a 'grafter' in the quantity of his work, and an artist in the quality of it.

The northern Chinese—that is, those hailing from the Gulf of Pechili district—are easily the best from a 'coaster's' point of view; cheerful, hard-working, good-natured big fellows, they are one of the finest types in the world, and their only fault is an inherent objection to soap and water. It is the southern Chinese (from Ningpo southward) who are the bane of existence to the coast officer. Bad-tempered and insolent, they are very difficult men to handle. Afloat or ashore, the greatest difficulty is encountered in trying to get them to do anything that is not 'allee same before,' and their unionism is such that the most trivial little trouble may cause a general strike or boycott.

There is no such thing as blacklegging when the Chinese go on strike; if there were, the blackleg would be killed with as little compunction as we should kill a troublesome fly. Everybody just quietly and unanimously ceases work, and nothing remains for the employer but as graceful a 'cave in' as possible. John is always careful to leave a little loophole in this respect whereby the employer may save his face. Both the Chinese and the Japanese have an easy, democratic manner of speaking to their 'bosses' or employers which it is very pleasant to see. There is absolutely no trace of servility in their manner, but neither is there any trace of 'cheek.' I myself have seen a Mongolian horse-dealer chatting quite freely and frankly with a Tartar prince. The employer or 'boss,' on the other hand, is always open to argument, and always acts, or pretends to act, as though he were giving the point his best consideration. This attitude of the employer prevents strikes from reaching the bitterly acute stage, as with us—a stage when, as the employer knows, he will lose 'face' in addition to money, and which will give his men an increased confidence in their deadly unionism likely to make for trouble in the future. As a rule, the European officer contrives to rub along very well with the difficult crowd he has to handle; but to get along smoothly requires no small amount of tact, especially in British ships, where a certain amount of discipline is maintained. In Chinese ships, the sooner a European officer realises that he is only there for his certificate the better; for if he cannot rest content to let the Chinese do as they like, he will not keep his position very

There is a curious conceit about the Chinese. They never seem to profit by experience, and object-lessons are lost on them. Often as the value of discipline has been painfully impressed on them, they still prefer to take chances. Naked lights in holds, smoking while loading kerosenecil-in fact, every possible breach of commonsense is committed unless they are constantly watched and checked. Checking is possible in British ships when an officer is supported by his firm, but not in Chinese vessels; and how the latter run so free of accidents can only be ascribed to a merciful Providence that watches over drunk men and Chinamen.

But the Machiavellian little plots of the Chinese sailor-man for getting rid of an unpopular officer are not so common as they used to be, so mayhap John is learning something in this respect. The last and most famous case of this kind happened in Sydney, New South Wales, when two of the engineers of the steamship Changsha were put on trial for murder. story is a long one, but the gist of it is as follows: An engineer had occasion to reprimand a fireman. Possibly he struck him; but, anyhow, the fireman disappeared from the ship, and his wily countrymen swore on oath that they had seen two of the engineers throw him overboard. At the trial this was proved to be a tissue of lies, and the heathen George Washingtons were arrested, and sentenced to heavy terms of penal servitude.

Another case was that of a chief officer. quartermaster of the 'bucko' type shipped on board a coast steamer; and the chief officer of this steamer being a very quiet, inoffensive man, given to letting things slide until they got out of hand, our pagan friend decided that here was a good opportunity to 'show off.' Accordingly he was heard by a European who could understand Chinese to boast that he was not afraid of any Englishman, and when the chance came he would show them how to fight the European, &c. Needless to say, the chance soon cropped up; but, greatly to his surprise, he was promptly put in irons. Unfortunately, as is the way of quiet men when thoroughly angered, the chief officer completely lost his temper, and struck the quartermaster while he had the irons on, then sent him forward to the forecastle. The 'bucko' went like a lamb; but when he arrived in the foreside some of his countrymen commenced jeering at him, inquiring if that was his idea of fighting the European. This was the last straw. He had lost 'face,' so without more ado he ran to the rail and leaped overboard. A boat was quickly lowered, and a long search made for him, but owing to the heavy sea the search was unsuccessful. At the inquiry the unfortunate officer refused to make any extenuating statement whatever, although almost asked to do so by the judge. The result was that he received a sentence of three months' hard labour.

The 'bucko' type is not a very common one amongst the Chinese. As a rule they prefer a much more subtle way of getting their own back than fighting. It is when a ceaseless round of petty accidents and thefts occur that the poor European realises the truth of Kipling's lines:

It is not good for the Christian's health to hustle

the Aryan brown,
For the Christian riles and the Aryan smiles, and

he weareth the Christian down;
And the end of the fight is a tombstone white,
with the name of the late deceased,
And the epitaph drear, 'A fool lies here who tried
to hustle the East.'

'No man savvys' how that accident happened. 'No man have see' that cap, knife, dollar, or boat They have just happened or disappeared, and the air of injured innocence assumed by the guilty Celestial convinces the unsophisticated Christian, despite his inward convictions, that he is only the victim of a series of unfortunate coincidences.

The Chinese never lose a chance to squeeze a European firm or individual. The case of the Fatshan was one of this kind. In collecting the passengers' tickets on one trip, the purser and his assistant, an Indian, came to a passenger who was apparently too ill or too dazed with opium to pay his fare. The Indian, by all accounts, was not so gentle as he might have been in getting the sum due, and according to Chinese witnesses kicked the passenger. passenger died before the ship arrived at Canton, and there was a furious uproar; the end being that a boycott was declared on the ship, and an armed guard of bluejackets were almost the only passengers she carried for a long time. To square matters, the company concerned had to pay compensation to the dead man's relatives, and incidentally give a large sum to the Hong-kong university. The truth has since leaked out. The passenger was put on board the ship in a dying condition, so that the expense of carrying a corpse to Canton would not be incurred. The freight on a dead body is very high in China.

What changes the Revolution will bring about in China remain to be seen. Meanwhile things are very much as they were during the old The country is in much the same régime. position as Great Britain would be if the Boy Scouts or Suffragettes were holding the reins at Westminster. Young China is full of crude altruistic ideas of government, and, with the blindness of extreme youth, sees no obstacle in the way of a glorious Arcadian republic where the wicked cease from squeezing and the detested European is not.

However crude Young China's ideas may be, in one thing at least he shows infinite wisdom: he steadfastly refuses to go to sea in the merchant service. At Wusung a mercantile marine training college has been established for some years; but as soon as the pupils graduate they either join the navy or stay ashore. Young Chinese officers have been tried in the China Merchants Company, but they would not stay. Possibly the powers that be did not want them. They might get to know rather more than was necessary for safe navigation. The European suits the wily Chinaman much better than one

of his own countrymen, so the European's services on the China coast will be required for many years to come. There, with the reader's permission, we will leave him.

KNIGHT ON WHEELS.

CHAPTER VIL -THE INCONSISTENCY OF UNCLE JOSEPH.

BUT no. Nothing of the kind.

It was a most amazing day altogether. It was a Thursday. They paid the usual visit

to the bank; after which Philip and his uncle parted company at Swiss Cottage Station, and Philip walked resolutely home. The Elysian Fields were closed to him. He wondered how long Peggy would wait, and what she would think when he did not come. He hoped that in her quaint, old-fashioned way she would take a leaf from her mother's book, and 'make allowances' for him.

Holly Lodge was deserted, for James Nimmo had washed up and gone round the corner, in accordance with his invariable custom of an afternoon, in order to recuperate exhausted nature by partaking of what he termed 'a wee hauf.' (Philip often wondered what he did with the other half.) Philip let himself in at the sidedoor with his latchkey, and, sitting down before the library fire, endeavoured to divert his thoughts by reading 'The Idylls of the King." He turned up Merlin and Vivien, which he had not previously studied, and set to work upon it. He had a personal interest in the name of Vivien now.

Meanwhile, two people were converging upon Holly Lodge.

The first was Uncle Joseph, returning from the City an hour and a half before his time. His business had been cut short by the sudden illness of one of his almoners, and he found himself free to return home at half-past three. He sat in a comparatively empty District Railway carriage—the human tide was not due to ebb for nearly two hours yet-perusing the current number of The Searchlight. It contained two interesting paragraphs. The first said:

'For some time past readers of The Searchlight have been forwarding to me copies of a weekly appeal for cash issued by an enterprising organisation calling itself The International Brotherhood of Kind Young Hearts. The modus operandi of the ingenious gentleman who conducts this precious enterprise is not without its merits. Evidently with the idea of appealing to every possible shade of sentimentality, the circular is furnished with a list of no less than fifteen charitable objects, and the dupes of the Brotherhood are requested to select the case or cases which excite their compassion most, and mark these upon the list when forwarding their The objects for which contributions donations.

are invited are most artistically varied, ranging as they do from the maintenance of "A Home for Unwanted Doggies" to the rehabilitation of a repentant but slightly indefinite burglar; but I can assure prospective contributors with the utmost confidence that, however meticulously they may earmark their pet cases, their money will all find its way into one capacious pocket. The administration of this exceptionally ingenious scheme of flat-catching is evidently in capable and experienced hands. Last week, anxious to make the acquaintance of the master-mind, I despatched one of my trustiest representatives to the headquarters of the Brotherhood, hoping that Big Brother-or whatever the arch flatcatcher calls himself-might be found at home. The offices are situated in Pontifex Mansions. Shaftesbury Avenue, and consist of an undistinguished suite of apartments with the name of the Brotherhood painted upon the outer door, accompanied by a typewritten notice to the effect that the secretary has gone to the country—a piece of information which is not altogether surprising. Here the scent abruptly ended, for inquiries elicited the news that the tenancy of the Brotherhood had terminated. Indeed, a new tenant was actually in possession when my representative called. We may therefore confidently expect Big Brother to break out shortly in a fresh place, probably with the name of his organisation slightly altered. As an alternative to "Kind Young Hearts," may I respectfully suggest "Fine Old Sharks"!

In another part of the paper Dill delivered his weekly comments upon the progress of his Christmas funds:

'Subscriptions for the Christmas Dinner and Toy Distribution are coming in steadily, and I am beginning to entertain high hopes of closing this year's account without a deficit. I have again to thank numerous old friends, whose names will be found in the list below, for the faithfulness and regularity with which they come to my assistance. This week's list is headed by an anonymous contribution of a hundred pounds. The giver is a gentleman whom, though his name is known to few, I regard as one of the most generous, and perhaps the most practical, philanthropist of my acquaintance. never known him subscribe to an undeserving cause, and I have never known him refuse a worthy appeal. His gifts are made upon the sole condition that his name is not published.

I am not prone to gush, and I will therefore refrain from commenting upon his rather unusual persistence in doing good by stealth. But I believe that deeds of this kind do not go unrewarded; and I can assure my anonymous friend that if he sets any store by the blessings of tired mothers and hungry children, they are his in abundance.'

Uncle Joseph smiled a wry smile, and turned to the financial article.

The second was a lady. She rang the bell at Holly Lodge just as Philip reached the last page of Merlin and Vivien.

James Nimmo was still moistening earth's clay at the establishment round the corner, and

Philip answered the door.

Before him, standing on the doorstep, he beheld a tall, beautiful, and gracious lady. She was dressed in deep black, and looked old—quite thirty-five, possibly forty. She had a rather sad face, Philip thought; but it lit up wonderfully when she smiled, which she did as soon as she beheld the stolid, sturdy little figure in the doorway.

'Is this Holly Lodge, little boy?' she asked.
'Yes,' stammered Philip. Evidently h

'Y-e-s,' stammered Philip. Evidently his visitor purposed crossing the threshold, and rules upon that subject were inflexible.

The lady smiled again. 'I think I know who you are,' she said. 'You are called Tommy.'

'Yes,' admitted Philip apprehensively. 'Only sometimes,' he hastened to add.

'I expect you have a grander name for state occasions,' said the lady.

Philip might have mentioned that he possessed several, but he had the good sense merely to nod his head.

'Are your parents at home?' continued the visitor.

'I am afraid there is nobody at home but me,' replied Philip, nerving himself to shut the door.

'That is capital!' said the lady. 'It is you whom I want to talk to particularly. So I am going to ask you to entertain me until your father and mother come home. Will you?'

Unconscious of the length of the visit to which she had committed herself, the Beautiful Lady walked into the hall.

Philip swiftly reviewed the essential features of the situation. The most obvious and pressing was the fact that a female had gained admittance to Holly Lodge. The second followed as a corollary—she must be ejected before Uncle Joseph returned. That would not be for a couple of hours at least. Surely he could get rid of her by that time! He led the intruder into the library—there was no drawing-room at Holly Lodge—and begged her to be seated. Then he installed himself upon the edge of a chair on

the other side of the fireplace and took feverish counsel within himself.

'You must be wondering who I am,' said the visitor pleasantly. 'I ought to have introduced myself sooner. My name is Lady Broadhurst, and I live in Hampshire.'

Philip remembered addressing the envelope now. He nodded politely. 'I know,' he said.

'Plumbley Royal.'

'That is right,' said Lady Broadhurst. 'I have been puzzling as to why you should have thought of writing to me. Where did you come across my address, I wonder?'

'It was in an old red book,' said Philip.

'I see. Still, it is strange that you should have selected me,' continued the lady musingly. She seemed perplexed, yet gratified, evidently suspecting the hand of Providence. Philip might have explained that the wonder would have lain less in his visitor's selection than in her omission; he had sent a copy of Tommy Smith's letter to every widow in the book who began with B. But his mind was working frantically behind a solemn countenance, and he did not answer. He was trying to put himself in Uncle Joseph's place. How would he have treated this intrusion? How would he have parried questions about Tommy Smith? How would he have substantiated the starving curate and his fireless home in the face of the solid comfort of Holly Lodge and the absolute invisibility of the curate and his emaciated progeny? Would he have dressed up James Nimmo as a curate? Would he have sent out to Finchley Road for a lady to represent the curate's tearful consort? Would he have explained that the curate had just received preferment, and gone to live at Berwick-on-Tweed? Possibly; but such feats of imposture were beyond the powers of a slow-witted, inherently honest philogynist of fourteen.

Lady Broadhurst was speaking again, in a low, musical voice, holding out her hands to the blazing fire. Philip noticed that these hands were long and thin, like Peggy's, and unlike the hands of the women whom he sometimes encountered sitting in omnibuses or serving in shops. Her feet were tiny, too. In the glow of the fire her eyelashes looked long and wet.

'I was very much touched,' she was saying, 'by your letter. Your wanting a little girl for a sister came very near home to me; for I have just lost a little girl of my own. She was all I had, Tommy. She was taken from me three months ago. I suppose we should take our losses as they come, without wincing or questioning the wisdom of God. But I was weak—and selfish. For a long time I refused to bow to His will. I cried out, and would not be comforted.'

The lady's eyes were really glistening now. Presently a tear splashed on to the long white hand. Philip felt strangely uncomfortable. He had been warned by his uncle more than once

to beware, above all, of a woman's tears. 'Her tears are the biggest gun in her battery,' Uncle Joseph had said. But Philip forgot to feel suspicious. He was only intensely sorry for the lady.

Presently she began to speak again, not alto-

gether to Philip.

'But I came to myself,' she said. 'I suddenly learned that all things work together for good, that there is no sorrow which does not bring its own consolation with it. One day I saw myself as I was—a querulous, self-centred, self-conscious, self-made martyr. I had forgotten that other people had their troubles too—troubles which I might do something to smooth away.' She looked up. 'Do you know who taught me that lesson, Tommy?'

Philip shook his head apologetically. 'I'm

afraid I don't,' he said.

'It was you!'

'Me?' said Philip, a little dazed.

'Yes, you! It was your letter. When I read it, I learned, all of a sudden, where the cure for sorrow lies. It lies in trying to help others. So I have come to see you and your parents, in the hope that I may be allowed to be of some small service to you all. I cannot give you a little sister to play with'——

The lady's voice broke suddenly, and Philip

tactfully arose and put coal upon the fire.

'But I may be able to help you in other ways. I am fairly well off, and I ask to be permitted to see that your father gets back to health and strength again. Do you think he would consent? He might like to go abroad for a little.'

Philip began to feel horribly uncomfortable. He had already allowed his visitor to assume that she was in the dwelling of an indigent clerk in Holy Orders, and that she was addressing Master Thomas Smith. Moreover, he had sat mute while she laid bare to him the tenderest secrets of a woman's heart, and the thought of what the end of the conversation must be made him feel a pitiful little cad. On the other hand, it was plainly advisable to establish some sort of working explanation, however lame, of the nonappearance of the Smith family. Once more, what would Uncle Joseph have done? He would probably have explained to this gracious being, quite courteously but extremely firmly, that she was an incubus and a parasite, actuated by predatory instincts, and would have cast her from the house. Philip, however, felt utterly incapable of, and entirely disinclined to, such a drastic course But plainly something must be done. of action. His head began to swim.

'Perhaps your father and mother would like to go away together for a few weeks,' suggested the lady. A glow of cheerful kindness was creeping into her cheeks. 'To the seaside, perhaps, or even to the south of France. They could take the baby with them, and you might come to me, Tommy. Could you accept me as your mother for a week or two, do you think?' There was a world of wistfulness in her voice. 'Could you?'

Apparently not, for straightway the solemn-faced little boy before her flushed scarlet.

'I—I'm afraid you have been making a mistake,' began Philip desperately. 'I'm not Tommy Smith at all.'

Lady Broadhurst looked puzzled.

'Not Tommy Smith? But you wrote me that letter, surely?'

'Yes, I wrote it,' admitted Philip in a low voice.

'Then where is the mistake? You are not the baby, are you?'

'No, I'm not the baby either,' said Philip miserably.

'But your father'-

'I haven't got any father—or mother, I'm afraid,' said Philip, feeling more guilty than ever.

The lady paused, and contemplated him with quickened interest. 'You poor little lad!' she said very softly. 'But whose house is this?'

'My uncle's.'

Lady Broadhurst's face cleared. 'I see,' she said. 'You have no parents of your own, but live with your uncle and aunt. Naturally you would regard them as your father and mother, and speak of them as such. I understand now. But that shall make no difference. In fact, I like the scrupulous way you tell me everything. If your uncle is ill'——

'He isn't ill,' said Philip regretfully.

'Then he is better?' said Lady Broadhurst with a cheerful smile. 'In that case he will be able to travel at once.'

Philip gripped the arm of his chair. The bad time had come.

'My uncle isn't a '--- he began.

He was going to say 'curate,' but at that moment, to his profound surprise and unspeakable relief, there fell upon his ears the music of a latchkey in a lock, followed by the banging of the front-door. Uncle Joseph had returned, an hour and a half before his time.

Well, whatever happened now, the responsibility had slipped from Philip's shoulders. And in the midst of all the present turmoil of his senses one emotion overtopped all the others—a feeling of intense curiosity to behold the archexpert in misogyny handling the situation. It would be a sensational scene, Philip thought. And he was not disappointed.

'Hallo, there, Philip!' Uncle Joseph's voice rang out from the hall. 'Are you in?' The library door stood ajar, and his words could be

heard distinctly.

'Yes, Uncle Joseph!' called Philip.—'That is my uncle,' he explained, turning politely to the Beautiful Lady. 'He'——

But the words died on his lips. Lady Broad-

hurst was on her feet—deadly white, and shaking. One hand was at her heart; the other fumbled at the mantelpiece for support.

Uncle Joseph's voice rang out again, this time

from the neighbourhood of the hat-stand.

'I'm back sooner than I expected. Skip about and get me some tea, you young beggar!'

The Beautiful Lady's white lips parted, and she uttered a faint cry. But she did not move.

Philip went out into the hall. His uncle was hanging up his greatcoat.

"Well, young man?' he observed cheerfully.
There is some one wanting to see you in the

library, Uncle Joseph,' said Philip falteringly.

'Oh! Who?'
'A—a lady.'

Uncle Joseph's brow darkened instantly. 'A lady' he said icily. 'Who let her in?'

'I did. At least she came in.'

'Well, we can appraise responsibility later. Meanwhile'—— Uncle Joseph, very stiff and erect, strode across the hall and into the library.

There was a moment of dead silence; and then a great cry, then a rush of feet, then silence again—silence that could be felt.

What had happened? Philip wondered.

Then, at last, came voices.

'Vivien! Vivien! Vivien! My little Vivien, after all those years! Thank God for His infinite goodness and mercy! My Vivien! My little girl!'

'Joe! Joe! Dear, dear Joe! At last, at last! Hold me closer, dear! I can't believe it yet! I'm frightened! Hold me closer! Oh, my dear, my dear!'

Then the voices blended into an indeterminate,

cooing, soothing murmur.

Philip looked into the library.

Upon the hearthrug, with his back to the door, stood Uncle Joseph, misogynist. In his arms he held the Beautiful Lady, and he was passionately kissing her eyes, her hair, her lips.

Philip retired in good order and closed the door softly, leaving them together. Once in the hall, he snatched up his cap and coat and slipped out of the front-door. The afternoon light was fading. There was still a chance, he thought. He broke into a run.

(Continued on page 116.)

A GLASS BOTTLE REVOLUTION.

By PERCY CROSS STANDING.

THOSE who can call to mind the old and universally adopted method of glass-bottle blowing, ensuring to the worker in it, as has been stated, an average life of not more than thirty-six years, will be interested in an invention which bids fair to revolutionise the manufacture of glass bottles. The machine is the idea and the work of a French inventor, M. Philippoteaux, who has had the good fortune to succeed in a field of invention in which so many others have failed.

Some idea of the magnitude of the demand for small bottles in Great Britain, and of the enormous business created by that demand, may be gleaned when it is stated that the Board of Trade statistics for bottles imported from abroad show an average of not less than one hundred and thirty thousand gross per month! Should the foreigner be permitted to retain so large a trade in this industry?

The Philippoteaux bottle-machine is in two types, one for producing various kinds of small bottles, from the modest penny ink-bottle up to an eight-ounce medicine-bottle, and the other for a great variety of larger-sized vessels. The machine, which the present writer has seen in operation, is quite simple in design, strong, speedy, free from vexatious complications, and—this is of first importance—works continuously. It is operated and the glass blown by compressed air always under control, the requisite

pressure being automatically regulated. The invention is unique, inasmuch as it provides a machine for producing small bottles by the blowing process only, and affords marked advantages, both as regards the amount of output and the quality of work, over existing methods.

Previous to securing patents in this country, the inventor had perfected and patented the machine in France and in all other civilised countries, including the United States and Germany. Two or three of the machines are already at work night and day in London, principally in the manufacture of small bottles for ink and varnish. The record of their output has been checked and reports have been made by practical manufacturers and independent consulting engineers, thereby affording a sound and safe basis for calculation. An additional furnace is to serve as many as ten machines.

It is a commonplace to assert that the demand in the United Kingdom for various kinds of small bottles is almost incalculable. This being the case, M. Philippoteaux and his coadjutors have already secured half-a-dozen sites for works and factories in different parts of the country.

Among leading experts who have witnessed the Philippoteaux machine in operation, Dr F. H. Bowman was so much impressed by the simplicity of the process that he said to me, 'After I had seen the attendant make a few bottles I sat down on the operating seat and made a bottle myself.' A second point that struck Dr Bowman was the ease with which the machine may be manipulated by unskilled labour, simply requiring a lad to maintain the feed of melted glass while another removes the bottles as fast as they are delivered from the machine. On this point of simplicity and directness, Mr Ford-Moore, the well-known consulting engineer, testifies that the rate of production is already about twice as large as by existing methods, and that the automatically regulated low air-pressure and the type of mould utilised together make for perfection in production.

Again, it would be difficult to exaggerate the ease with which the manipulation of the new process may be acquired by the worker, any labourer of average intelligence becoming quite proficient after a few days' tuition. It has been found that the inventor was at first unduly lavish in his estimate of the cost of production. The manager of the well-known York Glass Company, whose reputation for the highest class of work is familiar to those interested in the

business, at once expressed the opinion that M. Philippoteaux's invention must revolutionise the glass-bottle industry. Another practical bottle-maker of some forty years' experience informed me that his firm frequently receive requests to 'tender for twenty thousand gross of small bottles,' a demand which no single firm or half-dozen firms could hope to cope with under the old method. This new invention changes all

At the present early stage of development it is perhaps only necessary to add that a remarkable revolution is promised in an important industry by this unique invention. Apart from the question of mere expediency, it is obvious that a practically 'all British' trade in glass bottles should speedily be substituted for the vast quantity at present imported from Continental sources; and another and not less important advantage could not be better or more explicitly summed up than by an expert who has written that the new method more than doubles the output, while at the same time it reduces the ratio of wages by four to one in favour of machinery.

THE TILERIES STACK.

CHAPTER III.

JIMMIE went up the first two or three dozen rungs of the ladders with boyish exhilaration.

Then, still assending he tried to interest him.

Then, still ascending, he tried to interest himself rather closely in the joints of the ladder-pieces. A little more and he ventured upon a side peep at the scenery beneath him. This led to a great and cheering surprise. Instead of being upset by what he saw, he liked it. No dizziness seized his brain, but a sublime and ennobling sense of excitement. He felt like shouting 'Hurrah!' and waving his hand to the world at large.

It was an impressive discovery; so totally unexpected, moreover, that after his initial triumph he dared to wonder if he could believe in it as anything better than a temporary intoxication of which the after-effects might be calamitous. But such a fancy was not to be humoured. He understood this when he had made a three-quarter turn of the head and perceived the abyss of the clay-pit also, as it were, under his heels. One glance into that and he hurried on. It was a magnificent sensation, but made the brain riot unduly.

'It's capital sport. Nothing much to gas about, after all, in this monkey-work!' he told himself. But he held the supports of the ladder rather more firmly than heretofore, and fastened his gaze for a spell upon the bricks of the chimney itself. To sober his brain he urged his mind's energies upon the business part of his adventure, and smiled as he climbed on.

Beyond question, Phineas Ridley's face would be a sight to behold when and wherever they met on the stack. Probably the old chap was still unaware of his visit to Bidston. To be sure, there was just the possibility that Mrs Ridley's tongue had broken loose about him in the night. If so, it was to be hoped that she had kept him also sanguine that he (Jimmie) was the mean sort of wretch who would sacrifice his soul's ideals for cash, and that Mary was the kind of girl to rejoice in such a husband. Otherwise-But the alternative was not fit for thought. briefest possible consideration of it sent a shiver down Jimmie's climbing spine. He preferred to hearten himself immediately with Mary's words about the old man's improved disposition towards him since the Tuesday of his brother Silas's death. There would be rich realism in Phineas's first stare at him in a minute or two, but he was fairly justified in trusting that there would be no hurricane of curses to follow. Upon one point he was determined. He would not stay long enough with Phineas for anything like intimate conversation. 'Good-day, Mr Ridley. I've brought you a telegram. I happened to be passing, and I thought I'd see how much nerve I've got. See you by-and-by—perhaps! Mustn't wait now!' He would fire at the old chap some such greeting as this from the topmost ladder, laugh at his bewilderment, give him the telegram, and descend. The 'perhaps' would, of course, be an inaudible aside. Nor was it at all likely

that Mr Ridley would hunt down after him and chase him towards Hoxley Fields for personal or

any other reasons.

Thus far his thoughts and schemes. They were not particularly rational, and herein of course they took their cue from the impulse which had driven him to do what he was doing. But they ended in the sudden realisation that his goal was at hand.

The wind had whistled snappily at him off and on from the farther side of the stack without disquieting him. A gust with a full-throated bellow in it charging round at both his shoulders simultaneously checked his progress, which for the last hundred and fifty feet had been dreamlike and automatic. He flattened against the ladder, looked up, down, and up again, all in one moment.

It was a ghastly moment of disillusionment. 'Oh my God!' he wailed then, his face and closed eyes set towards the chimney again. For many more moments he stood quite still, save for his tremors.

The abnormal Jimmie Bishop of five or six minutes ago had evaporated, and he was his more familiar self again—a panic-stricken imbecile in such a situation, with a heart that seemed trying to thump its way out of his body. He saw and understood much in these grim moments when all his powers of vision were turned so searchingly inward. But nothing mattered now. He was as good as dead, and he deserved to be dead. No one would be sorry except Mary, and she would be well rid of him. Oh, what a fool he had been in this first and last prosperous year of his life!—what a fool!

But this compound distress was too much. He opened his eyes and yelled. The cornice of the stack's great head, an irregular cube in shape, was about thirty feet above him, with the outer ends of the scaffold and a rope on a pulley therefrom just frilling out higher still. He stared at it, wide-eyed and wide-mouthed, ready to yell again—though without thoughts of Phineas Ridley or any one. But, in fact, he made no more noise of that kind. strange and merciful interest in the cornice took hold of him and gradually drew the horror from his stare. Gradually also his nervous terrors calmed and counsels of good hope breathed in him. He was so near to the top and Mr Ridley, and once there-once past that outthrust part—the rest would be child's-The outward bulge certainly looked rather awful, but that didn't mean that it was dangerous. The long length of ladder—thirteen or fourteen feet, he estimated it-which sprang away from the side of the stack to the cornice-edge was really only a few degrees worse than perpendicular—quite a few; and the foothold and handhold which it offered were of course as safe as anywhere else. They were epochal

minutes in Jimmie's life, these two or three, all told, from the first of his shudders as a man condemned to die to the setting of his teeth and the next rung in the ladder.

'I'll not be beaten!' he whispered; and a very few seconds later he was over the bulge. Hence to the summit it was a soothing inward slope four or five yards high, with the scaffold-poles to the right of him like the arms of protecting friends.

Spread-eagled on the last ladder, he raised a shout of victory and laughed up at Mr Ridley. His shout disturbed the chimney-jack in an idle moment standing by the lightning-conductor, with an empty trowel slackly in his hand. It was no time for exact scrutiny of the look with which old Phineas regarded him while he finished his climb. It was not a look to grace a Sunday school, but Jimmie expected nothing so unnatural. He almost ran up that last ladder to the level stone-flagged promenade some two feet wide which circled the dark vent of the stack, and nodded at the slowly approaching chimney-jack. He couldn't do more than nod yet.

Phineas was the first to speak. 'You mean to tell me, young feller, that's you?' he said hoarsely, with a tranquillity that ought to have brought suspicions into a mind so practised in human nature's analysis as Jimmie's. There was scarcely a show of excitement in his eyes, and none in his voice.

'Yes, Mr Ridley,' responded Jimmie, panting eagerly. He held out his quivering hand to be

grasped. 'How are you? I'-

'You!' then cried the interrupting chimney-jack, and there was no misreading the tone of this second 'you.' A sudden glare was in his eyes. He tossed the chisel into the empty space to the right of him. 'I calculated it was my mate Tom Swallow,' he continued, with a clever but ominous return of calmness. 'I dunno what Tom's up to this mornin', but it'd ha' bin safer if it'd ha' bin him—safer for two or three of us. D'you foller me, Mr Jimmie Bishop from London?'

'I want to explain to you, Mr Ridley,' said Jimmie feebly. The earlier horror was creeping over him again. The flight of the chisel started it. This, added to the now realised shock of the chimney's inside edge and what lay beneath it, and the sight of Phineas's closing fists, which seemed to emphasise the hate in his eyes—together, they turned him sick in a moment. He slid away from the old man, careful inches at a time; and, inches for inches, the old man followed him.

'Explain, is it?' Phineas grinned frightfully. 'What I'm goin' to do is to explain with me knuckles—these 'ere knuckles' (he exhibited them)—'on yer win'pipe. About time, too, after yon letter!'

The menacing attitude of his huge fists fell to pieces as he flung a hand into his pocket.

'Letter, Mr Ridley?' said Jimmie with an effort. He saw the ugly giant through a mist. But sparks flickered in the mist, and these gave the chimney-jack's countenance a diabolic background. He had ebbed as far as a scaffold-pole and steadied himself with it. 'What letter?' he whispered.

Phineas snatched it forth and flourished it in the air like a Jove with clenched lightnings ready for a naughty world. His lips parted. Standing still some four average paces from Jimmie and the pole, he was positively on the point of obliging with a direct, business-like answer to that plain question.

What a saving of pain, to more than one, if he had done so! Even if he had crashed the letter's news upon Jimmie like Jove's thunder after the imperial lightning, there was still the chance that it would have roused Jimmie's failing faculties; his mind might have sprung to attention, and in a lucid minute or two succeeded in coaxing the crazed old man to toe the line of reason.

It truly was an enraging letter for the chimneyjack. He had received it that morning from Corser & Jones, his brother Silas's solicitors-Birmingham people. When, on the Wednesday, word reached him of his brother's death from Martha Morris, Silas's housekeeper, he had journeyed to Cinderbank as a fraternal matter of course; to arrange about the funeral, for one thing, and secure his brother's last will and testament, about which Silas had told him more than a year ago, and where to find it in case of He had duly settled the funeral for Saturday, but had not found the will. Morris said Silas had sent it to his solicitors in January. This surprised Phineas a little, but not much, for Silas was a man whose word could usually be relied upon. 'Ah! Maybe so's you mightn't get peepin' at it!' he surmised, with his natural coarseness; and, with a gentle for-giving smile, Martha agreed that that might be so. 'Well, I'll drop 'em a note for it,' Phineas said further; and after some just commendations of Martha for the care and patience—especially the patience—with which she had attended Silas during the last ten years she had been domiciled with him, he patted her plump shoulder and returned to Bidston. He wrote to Corser & Jones very suitably as one in authority, not only as their client's nearest of kin, but as father of the chief and to the best of his belief sole heiress of Silas's estate.

But Corser & Jones's reply that morning began by muddling his head because of its absurdity. It muddled him to such an extent that he didn't even use strong language about it at first. He passed it to Mary in the Hen Lane house with an opinion that they didn't know what they were talking about. It was brief in its statement that it was their duty to advise

Mr Phineas Ridley that he was mistaken in supposing that his daughter Mary was the principal beneficiary in the recent will, of their own drafting, which Silas had left with them. One hundred pounds only was bequeathed to her, and everything else to Mrs Martha Morris of Cinderbank.

Mary's estimate of the letter, of course, differed from her father's. She kissed his ugly face and said, 'Never mind, dad. I don't care, and you mustn't.'

And then Phineas rushed for the Tileries stack and daily toil. He didn't even call for his mate Swallow on the way. He took the letter with him. 'Stop yer howlin'!' he shouted at poor Mrs Ridley, whose dismay had sought prompt solace in tears; but to Mary, ere he banged the door, he only said gruffly, but with bloodshot eyes and his chin-beard shaking, 'I'll think it over!' as if some good might come of that.

He thought it over striding to the stack, ascending the ladders of the stack, and on the stack; and long before he glanced round from the lightning-conductor at Jimmie's proud eyes and wind-blown hair he had come to the conclusion that there were two folks on the earth whom it would be a relief to throttle. That moon-faced, meek-and-mild, crafty hypocrite and cat of a widow, Mrs Martha Morris, was one, and Jimmie was the other. The collapse of his very primitive, simple, renewed aspirations about Jimmie and Mary as a sequel to his brother's demise mounted Jimmie upon a loftier-pinnacle of hate as a family foe than ever before.

So, instead of answering Jimmie's question, Phineas crushed the letter in his hand, sneered like a fiend, and threw it after the chisel. 'I'll letter you, me son!' he hissed, making a long, steady stride to the platform.

There was murder in his eyes. Jimmie couldn't see much distinctly, but he saw this. He stood the first, second, and third strides of the demoralised old man. Then he loosed the pole and turned as if to leap into eternity on his own account; but instead he made a wild steptowards the frail sanctuary of the rest of the scaffolding, his feet missed the plank they aimed at, he grabbed a hanging rope, which his deadweight caused to run through his fingers like something greased, and a quite inappreciable cry cozed from his lips as he slipped down it.

Not, however, to the quick death to which he had resigned himself. He expected to drop through space like a stone when he came to the end of the rope. But in fact the rope hung straight to the upper side of the obtuse angle of the stack's great head, and there it landed him with a trifling shock. And the next thing he knew about himself was that his feet—the major part of them, not his toes—were resting

upon a collar of level stonework a few inches wide, and that his back was buttressed against the slope of the stack's headpiece. He was as little out of the perpendicular, though in the other direction, as that last trying ladder of his ascent to the cornice, but his consciousness was not keen enough to think of that. The rope was still in his hands as a further support.

In this grisly situation—its grisliness paralysed him and made him relax his hold of the rope—he heard Phineas above address him as from another world, 'That's neat, Jimmie Bishop; uncommon neat. You couldn't ha' done it prettier if you'd tried yer durndest. Stick tight where you am, young feller, while I put on me considerin' cap about you. I'm openin' me knife, but I dunno as I'll cut the rope all in a minit. Theer's for and agin that. And, anyway, you've some time for yer prayers. Start on 'em—that's my advice to you, afore you topple overboard without any interferin' from me. Art listenin', boy?'

Jimmie heard without any attempt to listen. Will and power for endeavour of any kind seemed to have left him as soon as he perceived what had befallen him. He lay thus pillowed in mid-air comfortably enough, staring across the void at the blue sky and the horizon

hills.

Then he heard a chuckling laugh and some more words. 'Two funerals in two days—that's rough on a chap's spirits, some folks'd say, and so I'm goin' to cheer meself up wi' some 'bacca.—Any objections to me smokin' my pipe, you down theer?' But he didn't hear the next words,

following the strike of a match: 'Stubborn, are ye, young feller? Come, rouse up!'

And when the chimney-jack jerked the rope Jimmie's hands dropped from it, limply, to his sides, and stayed there as if he were asleep or dead of fright, like a bird faced by the jaws of a snake.

'Hello! Loosed it, have you?' said old Phineas in a tone of surprise, beginning to draw the rope up to him. 'What's thy game now, me lad?'

Jimmie neither heard this nor answered the question. And it was certainly well for him and others that he was as deaf as the chimney itself to the words which then broke from the old man.

Some one held him firmly by the arm and

said, 'Father!' close to his ear.

'God's truth, Mary, what brings you here?' stammered the wretched old man when his pipe had broken at his feet with a little shower of fragments for Jimmie's head. He turned his wild-eyed face from his daughter the next moment, shrinking before her gaze.

'What does it mean, father?' she whispered, looking down at the motionless Jimmie. 'I thought something was wrong. Oh daddy!

daddy!'

They were bad moments for both of them; but old Phineas would sooner have been confronted by ten angels of doom there or anywhere than by this pale, slim girl in black, with her skirts looped at the ankles, dishevelled hair, and eyes of which the restrained anguish alone condemned him for what he was.

(Continued on page 120.)

ROME AND CARTHAGE.

PART II.

THE SECOND PUNIC WAR (218-202 B.C.).

THOUGH a peace of twenty-three years followed the First Punic War, the possibility of a renewal of hostilities was never far from the minds of both nations. During these years Rome had dangers at home, but she kept an eye on her enemy in Africa. The northern Gallic tribes threatened her with invasion; but the naked Gauls, fighting only with javelins and swords that bent at the first stroke, proved but weak adversaries to the disciplined legions of the republic. In this interval of time Rome added new provinces to her territory, and the Flaminia Via, the great military road to northern Italy, was completed.

As for Carthage, internal strife and faction marked that period which should have been devoted to national consolidation. These were dark days for Carthage. Her mercenaries, whose wages were in arrear, rebelled, and were only subdued in that cruel and sanguinary conflict

known as the 'Truceless War'—a war of extermination.

In order to understand the circumstances which led up to the Second Punic War it is necessary to appreciate the part that Hamilcar Barca played in the politics of Carthage; for in the heart of one Carthaginian, at least, the fires of true patriotism still burned.

The government of Carthage was divided into two parties. There was the Peace Party, composed of men who followed Hanno the Suffet, and who esteemed wealth and ease more than the honour of their country; and there were those led by Hamilcar Barca, who, smarting under the humiliation suffered at the hands of the Romans, formed the true Patriotic Party. This Patriotic Party was in the minority; hence it was that though Hamilcar Barca fought well for his country in the First Punic War, his operations in Sicily were detached, to some extent, from the general campaign. He waged a war within a war.

Hamilear Barca, though not enjoying the confidence of his countrymen, determined to restore the ancient prestige of Carthage. For this he required men and money. These he could never hope to get from the Peace Party at home; and there was something heroic in the idea that he conceived of founding a colony in Spain, and making it the base for future operations against Rome.

For nine years Hamilcar Barca laboured in Spain—nine long, strenuous years of toil. He founded a colony, conducted trade and worked the silver mines, established confidence between himself and the natives, and collected and trained a large army. He died sword in hand, a soldier's death, in 228 B.C., leaving his son to realise all his dreams.

The great Hannibal was the son of Hamilcar Barca, and he inherited his father's valour, his father's military genius, and his father's bitter hatred of Rome. Never did a son more faithfully take up his father's work or show more zeal for the ambitions of his father's heart than did Hannibal. 'It was not till he' (Hannibal) I quote from Bosworth Smith's History was an old man in exile that he told the simple story of that which had been the ruling passion of his heart. In his ninth year, so he told Antiochus, when his father, Hamilcar, was about to set out for his command in Spain, and was sacrificing to the supreme god of his country, he bade the attendants withdraw, and asked the little Hannibal if he would like to go with him to the wars. The boy eagerly assented. "Lay your hands, then," said Hamilcar, "on the sacrifice, and swear eternal enmity to the Romans." Hannibal swore, and well did he keep his oath.' For seven years he assisted his brother-in-law, Hasdrubal, to extend the Carthaginian power in Spain, and on the death of Hasdrubal, the soldiers with one voice chose Hannibal as their general.

It is impossible to speak of the Second Punic War apart from Hannibal. His genius conceived it, his valour sustained it, and his personality permeated it from beginning to end. Think, then, of Hannibal plotting and planning a great invasion of Italy, moving to and fro in Spain, the country of his adoption, setting aside every other ambition or attraction, and bending every circumstance to the furtherance of the burning purpose of his soul, and you see a national hero of the highest type.

With his far-seeing eye ever set on the gates of Rome, Hannibal spent the first three years of his command in Spain in preparation. He completed the organisation of his army, that army that was composed of infantry and cavalry of such varied nationalities. First he had thirty-seven elephants, then he had Gallic infantry and veteran Libyans and Spaniards, lighter-armed troops of different nationalities, Bulgaric slingers, Gallic heavy cavalry, and the

dreaded Numidian horse. These Hannibal collected and drilled, and inspired with so great a loyalty that for nineteen years they followed his standard over mountains crested with snow and through the dangers of many campaigns without once being guilty of mutiny or desertion.

Early in the summer of 218 B.C. Hannibal left New Carthage, in Spain, with an army of ninety thousand foot, twelve thousand horse, and thirty-seven elephants. He crossed the Ebro and subdued a hostile tribe of Spaniards. Here he left ten thousand foot and one thousand horse to hold this newly acquired territory. Another ten thousand foot he sent back into Spain, and with the rest pushed on toward the Italian Alps. He had already crossed the Pyrenees before the Romans had heard of his start or were aware of his intentions.

These were not the days of copy-seeking warcorrespondents. No pocket-camera or pen-andink sketcher followed the march of this heroic army. Hannibal left no *Commentaries*, as did Cæsar. The hopes and fears, the toils and trials, the thousand and one incidents and cruel necessities of so long a march are left to our imagination alone. The song and the curse, the shout of laughter and the cry of pain, settled into silence with the dust the army raised in passing.

with the dust the army raised in passing.

This great march of Hannibal, extending as it did over some eight hundred miles, was a wonderful piece of military enterprise. Though it was described by contemporaries, and though one historian living fifty years afterwards went over the ground himself to verify the reports that reached him, many of the details are lost, and its general direction is a matter of dispute.

Hannibal reached the foot of the Alps some time in October of the year 218 B.C. He gained the summit in nine days, and six more days brought his army in full view of the smiling plains of northern Italy. These were fifteen days of hunger, cold, and exposure. On the summit of the Alps symptoms of despondency appeared in the army; but Hannibal was not the man to miss so great an opportunity of inspiring his followers. 'Ye are standing already, as ye see,' he said, 'on the Acropolis of Italy; yonder,' pointing to the far horizon—'yonder lies Rome.' We recall the words of another military giant who, when passing the Pyramids of Egypt, told his soldiers that forty centuries looked down upon them.

But what pen can fitly describe the perils and hazards of the prodigious enterprise? This army of mountaineers fought a great fight against the elements of nature. What a sight for the gods of an heroic age it must have been to see that long file of men slowly and painfully wending its way to the summit of those rugged mountains; to watch those huge elephants moving with their peculiar stolid impassiveness through Arctic regions foreign to their nature! Horses slipped and plunged

through ice and snow, and the ancient warrior, in his strange old accoutrements of war, struggled and fell as he fought his way over the ice-bound ridges. It requires some imagination to conceive of this march over the Alps, and the boldness of the enterprise reveals the character of the young man Hannibal. Burning with a deep hatred of Rome, he controlled and led his army with coolness through the greatest dangers. He knew the risks; he knew the dangers; but he was confident of his abilities.

If Hannibal did overestimate the resources of the northern countries of Italy, if he did overestimate the support he would get from disloyal allies of Rome, this invasion was admirable in its audacity and in the manner in which it was effected.

It is recorded that some forty thousand infantry, six thousand cavalry, and thirty elephants perished on the Alps. Such heavy losses, however, did not dash the spirit of the bold invader. With great vigour Hannibal set about conquering Rome in her own territory. Great as was the idea of the invasion, the way in which it was conducted was greater. For seventeen years Hannibal supported himself and his army in Italy practically without assistance from Carthage. Throughout this campaign, full of dangers and risks, the genius of Hannibal is ever in evidence. Mountains, rivers, and marshes were crossed, cities were taken, and provinces conquered. He penetrated into the farthest corners of the peninsula. No army could stay his onward march to Rome; he No army went where he would. Legion after legion was raised against him, but while on Roman territory Hannibal never suffered a single defeat. He seemed to be made for victory. Often outnumbered, sometimes caught in a weak position, Hannibal always contrived to outwit the Roman, until his name became a terror in the land.

The Second Punic War is rightly spoken of as the war of Hannibal. His spirit overruled every other spirit in it. The first three years witnessed Hannibal's most brilliant victories. First it was a skilful ambush on the banks of the river Trebia, which surprised Sempronius in the rear and turned his seeming victory into a crushing defeat, only a mere remnant of two Roman armies escaping. Now it was a rising fog which hid from the view of the oncoming Roman legions the Carthaginian forces cleverly posted on the hills before the Lake Trasimene. On came the thirty thousand Romans, quite unaware of the presence of the enemy. At a given signal down rushed the Carthaginians from every side upon them. The carnage lasted three hours, and fifteen thousand Roman corpses covered the ground.

The Roman Senate could not disguise from themselves the nature of the calamities which threatened the state, and the consternation which prevailed among the *populus* revealed to the

survivors of Trasimene the full reality of what had happened. But it required the defeat of Cannæ to complete the disasters of Rome. Here, if we may trust the figures, Hannibal, with thirty thousand men, completely outmanœuvred and defeated eighty thousand Romans. Fifty thousand Romans were left dead on the battlefield, and twenty thousand were taken prisoners.

The position of Rome after the battle of Cannæ was critical. Nothing now stood between Hannibal and the gates of Rome. The news of the defeat threw the populus into a frenzy; but never was the resolution and determination of the Senate shown to better advantage. When Varro, the surviving consul, returned to the city he was publicly thanked not only for his efforts, but because he had not despaired of the capital. (A defeated Carthaginian would have been nailed to the cross.) No word or thought was given to the offers of peace from Hannibal, and steps were immediately taken to protect the city.

Hannibal had crossed the Pyrenees, and had fought his way over the Alps; he had invaded Italy and defeated the Romans at every point. No legions now barred his march on Rome. His dreams were fast turning into actualities. The goal of his ambition was in sight; and yet, when the citizens of Rome were hourly expecting his attack, he refrained from this culminating act of the drama. Why? Why did not Hannibal march on Rome after the battle of Cannæ? Not because he lacked genius or determination. Not because he was afraid. Was it because of his habitual aversion to long sieges? It is a matter of conjecture. It may be that in this restraint he revealed the superiority of his judgment. Perhaps he realised that though he might beat a Roman army in the field, he could never take their capital or crush the spirit of the Roman nation. Perhaps he saw in the factious state of Carthage the ruin of his dream of a conquered Rome.

From this point the war loses that intensity which marked the earlier phase, and the ascendant star of Hannibal now begins to decline. For nine years Hannibal sustained with superbability a losing battle. He devastated, he burned, he destroyed. The Romans were ever at his heels. They dogged his footsteps, but kept beyond his reach. The inevitable result of all his efforts must have forced itself upon his mind. Time, now Hannibal's greatest enemy, saved Rome in silence.

Yet there was one chance on which this Carthaginian might rely. Reinforcements from Spain were expected daily. Hasdrubal, the brother of Hannibal, had been left in charge of the Spanish colony, with instructions to follow into Italy as soon as he was able. It was well that the Romans prosecuted the war in Spain with the vigour they did. Great as the strain had been to hold Hannibal in

check in Italy, Rome had still spared some legions to fight in Spain. For ten years they had succeeded in occupying Hasdrubal, but now he had slipped through their fingers. Hasdrubal crossed the Alps, following his brother's route, and sought to join hands with Hannibal.

The amazed Romans, when they heard of Hasdrubal's approach, found themselves once more on the verge of destruction. One son of the dreaded Barca family had proved too much for them; but to have two together in

Italy spelt utter ruin.

But Nero, the plebeian consul, rose to the occasion. Effecting a masterly forced march of two hundred miles, he joined his brother consul's army. Together they defeated Hasdrubal in the battle of Metaurus; and such was the barbarity of the ancients that the first intimation that Hannibal received of his brother's presence in Italy was the sight of Hasdrubal's head flung into his camp by the victorious but callous Nero.

The battle of Metaurus sealed the doom of Carthage. Any hopes of success which may have lingered in Hannibal's mind must now have expired. His position was hopeless. It became worse and worse until he was recalled

to Carthage.

The Romans at once transferred the war into Africa under the command of the famous Scipio, and the battle of Zama (202 B.C.) was at once the first defeat that Hannibal had suffered, the end of the Second Punic War, and the end of the history of Carthage as an independent nation.

Thus Hannibal's attempt to conquer Rome failed, and at this failure we are neither surprised nor disappointed. We are not surprised, because the elements engaged in the struggle were so strong against Hannibal that it was next to impossible for him to succeed. There was such strength in Rome and such weakness in Carthage that the issue was inevitable from the first. To us, who see the whole struggle stretched before us, it must seem that Hannibal was attempting something impossible. We are not disappointed at the issue of this struggle, because Rome's virtues outnumbered her vices, and it is doubtful whether the same can be said of Carthage. The effect of the ascendency of Carthage on the civilisation of Europe at this period is inconceivable.

Our admiration for the genius of Hannibal is not lessened by his failure. Perhaps ambition led him to make his greatest mistake, which was to suppose that he could re-establish a decadent aristocracy by the attempt to crush a vigorous republic.

The second Punic War demonstrates very clearly that though battles may be won by good generalship, by well-trained troops, by ability in finding the key of the situation, by surprises and clever tactics, the issues of wars depend on national resources, both material and moral.

There was nothing in the Roman army to compare with the military genius of Hannibal. There was nothing in Carthage to compare with the national spirit which supported Rome. The Carthaginians, with all their wealth, failed adequately to support Hannibal in Italy; and the reluctance with which they assisted their greatest general reveals the low morale of that nation. On the other hand, though Hannibal might despise the Roman legions, whom he outwitted so easily, he discovered behind them a power over which his most brilliant tactics had no control. There was in the Roman soldier a great firmness and strength of character which established mutual confidence between man and man, and which lifted him far above the paid mercenary of the Carthaginians. Rome's system of colonisation, based on the isolation of the colonies from each other and the close connection of each with the parent, baffled the Greek invader Pyrrhus and disappointed the hopes of the far-seeing Hannibal. But it was the military system of Rome which made her the world-wide conqueror. The ambitious Roman saw in the profession of arms the highest citizenship and the surest road to preferment. So large a part did this idea play in the Roman mind that to bear arms was perfectly to serve his country. In illustration of this we read that, in the time of Julius Cæsar, that general quelled the insubordination of his favourite legion on one occasion by the use of these words, 'I dismiss you, citizens.' The disgrace of discharge from legionary service was insupportable. Such were some of the qualities of the Roman character and government which enabled that nation to defeat Carthage.

From the end of the Second Punic War the policy of Rome broadened and her boundaries extended. War became more and more her passion, and conquest her absorbing ambition. Nation after nation went down before her arms; province after province was added to her territories. Her name and fame spread over the whole world known to the ancients. Wealth flowed into her coffers, luxury corrupted her citizens, and ruin was the end. It is a melancholy fact to contemplate that signs of the coming decline and fall were not wanting even at so early a period as the Second Punic War. The need for strong men to fill the legions thinned by the invasion of Hannibal did not fail to have its effect on the agricultural system of Italy. The peasant proprietor of the land was attracted to The three generations between the invasion of Pyrrhus and the expulsion of Hannibal saw the land of Italy pass from the hands of the smallholder into the possession of a comparatively few large proprietors. These large landowners formed a class by themselves, distinct from the old nobility. They became a power in Rome. By their wealth they controlled the Senate and the Forum; they monopolised the public offices, and divided amongst themselves the honours of the State. Though they were still patriots, their virtues began to fail. Their entry into the State heralded that era which witnessed the demoralisation of the Romans. Thus in the very hour of her victory Rome was sowing seeds of corruption. Whilst she covered herself with glory in conquest she soiled her feet in mud.

THE THIRD PUNIC WAR (149-146 B.C.).

The interval of fifty years between the Second and the Third Punic War was the saddest period in the history of Carthage. She suffered the humiliation of dependency without the advantages of protection. The chartered brigand, to use Bosworth Smith's expression, Massinissa, a wily Numidian chief, became a thorn in the side of Carthage. He encroached on her territory, and insulted and goaded her into distraction. In vain might Carthage apply to Rome for protection; none was given her. At last, without the consent of Rome, and thus breaking her treaty, she resented in arms the intrusions of Massinissa. Though Carthage failed in this attempt to preserve her integrity by resorting to arms, she gave Rome the excuse and opportunity that had been so long desired. It is said that Cato never ended an oration in the Senate prior to the Third Punic War without thundering out the expression, 'Carthage must be destroyed.'

The Carthaginians, in the manner of their last stand, proved that they were a nation worthy of a better end than that meted out to them by They resisted their implacable the Romans.

foes with great bravery to the last.

The demolition of Carthage was carried out to the bitterest extremity. Every building was levelled with the ground, and the plough was drawn over the site of one of the proudest cities of the past. A curse was pronounced solemnly over its ruins which has seemed to cast a spell over its site; every attempt to rear a city there has failed.

Thus ended the struggle between Rome and Carthage; and in such a manner was the Carthaginian civilisation wiped out. The total destruction of Carthage was cruel, unnecessary, and unfortunate. It was cruel, because Carthage deserved a better fate; it was unnecessary, because she was quite incapable of hurting Rome again; it was unfortunate, because through it we have lost so much valuable information regarding the social life of this ancient city.

The subject of the struggle between Rome and Carthage raises some profound questions in the philosophical mind relative to the international relations of the European Powers of to-day. downfall of Carthage illustrates the fate that has overtaken all the nations of the past. Carthage was only one of many who, springing into activity, flourished for a season, and finally succumbed to a stronger race. The histories of Egypt, Babylon, Assyria, Phœnicia, and Greece seem to preach the doctrine of the 'Inevitable End.' Rome even, proud Rome, proclaims in her decline the inexorable law of time.

In these repetitions of history, at once sad because of the gloom they cast over the story of the past, and satisfactory because through them can be traced the great laws of national evolution, must we also read the certain end of our own ascendency? Must the glory of Britain too pass away, and be buried under the ashes of succeeding epochs? It seems incredible that all the solidarity that we see around us may possibly fade away; but Britain has not yet outrun the span of Rome. And in what direction shall we look for our sure guarantee of permanency, and what right have we to claim the protection of the great 'most favoured nation clause'? Have we solved the riddle of the universe? Have we satisfied the great God of the Ages? Are we the climax of humanity?

It might stimulate the patriotic mind to discover on what plane the next great national movement will work or is now already working. Is it the physical, mental, or moral plane on which the battle is being fought out? Will Dreadnoughts settle the day? Will it be a long, grim commercial rivalry; or, after all, does not a nation's existence depend on its integrity and those fundamental virtues which have supported

every nation in the past?

There is one possible solution to the problem. It may be that we have reached that stage of civilisation when it will be possible for a number of great and powerful nations to dwell in independence side by side without seeking to annihilate one another, where there need be no first or last, but all advance together along the road of progress.

DAWN AT MONETA, ITALY.

FAR through the silent vale the dawn comes creeping,

And voices murmur 'neath the chestnut-trees; Across the rocky gorge the cypresses are sleeping, Untouched by sunshine or the autumn breeze.

From far Moneta's village on the vine-clad hill The laden mules slip downward to the dusty town,

Where groaning oxen with their marble loads All through the livelong day pass up and down.

See, through the olive-trees the sun comes peeping, And all the vineyards wake to greet another day;

Down through each grape-hung pergola the peasants come,

Pausing to greet the children at their early play.

The autumn sunshine bathes the myriad hills, Where olive gardens rise to meet the pines; Beyond the green campagna, far below, A wide, blue ocean in its glory shines. MURIEL RAIKES BROMAGE.

THE FLIGHT OF THE EMPRESS OF THEFRENCH FROM THE TUILERIES.

By GEORGE PIGNATORRE, B.C.L.

DARK and threatening was the outlook for the Empress-Regent on the 4th of September The campaign had opened with a series of disasters; and the news of the crowning calamity of the surrender of Sedan and the capture of Napoleon had reached Paris at three P.M. on the day before, arousing the passions of the fickle Parisians, who, true to their traditions, were bespattering with abuse the man they had bowed down to in prosperity, who, ill in body and mind, had yielded most reluctantly to the cry for war by the same people who were now

shouting, 'Down with Badenguet!'

A Cabinet Council had been held that morning, presided over by the Empress-Regent, to advise on the gravity of the situation. The Ministers could not or would not support the imperial dynasty; the capitulation of Sedan had sounded the knell of the Empire, and so they had besought the Empress Eugenie to resign the regentship, which had been conferred on her in accordance with the constitution. She had refused, and rightly, to desert her post of danger; although, should they deem the Emperor an obstacle to the tranquillity of the country, to the public weal in general, and proclaim his deposition, she would gladly lay down the authority she had been invested with; she would be only too content to be thus relieved of a heavy burden. For her own part, she wished that the true interests of the country, and not those of the dynasty, should be consulted. The Council of Ministers had come to no resolution; but, sooth to say, events were marching so rapidly that the matter had already passed out of their control into the hands of the populace. Trochu, the military governor of Paris, went over to the winning side; one by one the time-servers—and their name was legion—quitted the sinking ship, all save a loyal and faithful few who at the hazard of their lives betook themselves to the Tuileries to offer their services, their lives if necessary, in defence of the Empress.

these were the gallant Canrobert, Marshal of France; Admiral Julien de la Gravière, an illustrious writer; Madame Bourbaki; and others-not more than forty in all, out of the millions who had formerly acclaimed the Empress, and who had shouted themselves hoarse with cries of 'Vive l'Impératrice!' ('Long live the Empress!'). Outside could be heard the yelling of the mob, who were howling, 'A bas l'Espagnole / ' ('Down with the Spaniard!'), as their forefathers had howled, 'A bas l'Autrichienne!' ('Down with the Austrian!') in 1793. They were the same people who only seven or eight months later were to slaughter eighty captives, among whom was the archbishop of the city.

While the Empress was still standing in the great hall of the palace, awaiting her fate, Pietri, the prefect of police—whom I met years afterwards on board the Thistle, accompanying his imperial mistress—and the Ambassadors of Austria-Hungary and of Italy, aware of the imminent danger not only to the Empress but also to the devoted friends who refused to quit the palace unless accompanied by her, united their entreaties to persuade her to fly before it was too late, before the crowd surging outside had broken down the railings and forced an entrance. Pietri told her Majesty there was little time, and the two Ambassadors—Prince Metternich and the Chevalier di Nigro—added, 'Unless your Majesty wishes to sacrifice your own life and the lives of your friends!' They prevailed at last, chiefly by urging on the Empress the necessity of a swift decision if she wished to save the few staunch friends around her. The railings had yielded to the pressure of the multitude, and their shouts and oaths could be clearly heard as they came trampling over the grass plots. There was not a moment to be lost.

Hastily donning her hat and a light mantle, which were handed to her by one of the ladies of the Court, the Empress took a hurried farewell of her friends in these words: 'Never shall I forget what you have all been to me.' She was then hurried away by the two Ambassadors, notwithstanding her desire to pay a last visit to

JANUARY 24, 1914.

Badenguet was the mason under whose name the Emperor, when imprisoned at Ham, had effected his escape, and in derision the name was bestowed on Napoleon after the fall of the Empire.

the wounded lying in an ambulance ward fitted

up in the palace.

A few of her followers accompanied their mistress to the entrance of the Flora Pavilion, through which the Empress hoped to gain the Louvre, and thence accomplish her escape, if possible, by the Rue Rivoli; indeed, this was the only remaining avenue of safety, for every other egress was barred by the rioters. To their dismay, the party found the door of communication opening on the pavilion was closed and locked. The position of the little knot of fugitives was most critical; all seemed lost. It was even doubtful whether the presence of the two Ambassadors would protect the person of the Empress from outrage or worse, and it would certainly not avail to shield her attendants from ill-usage. The tramping of many feet and the hoarse shouts of the ruffians who had burst in were now heard more and more distinctly.

The Empress had made up her mind to abide her fate, when in the nick of time Mr Charles Thelin, the Keeper of the Privy Purse, arrived; he had in his keeping a master-key which opened all the doors of the Louvre and the Tuileries, and he had had the forethought to bring the key with him on hearing of the way taken by

the fugitives.

Passing rapidly through the long galleries of the Louvre, the party safely reached the colon-nade facing St Germain l'Auxerrois, where the Empress once more bade adieu to her attendants. With the assistance of Prince Metternich, and accompanied by one of her ladies-in-waiting, the Empress was able to procure a closed brougham and drive off unobserved through a crowd bawling the 'Marseillaise' or shouting, 'Down with Badenguet!' 'Down with the Spanish woman!' 'To death!'

The two ladies drove slowly the whole length of the Rue Rivoli, through the noisy crowds pouring in two opposite directions. One current was streaming toward the Place de la Concorde, the other toward the Hotel de Ville (Town For the whole way, until they emerged at the opposite end of the street, their safety hung in the balance. As there were few vehicles moving in Paris on that fateful September morning, the brougham might have excited curiosity or suspicion, and a stoppage or accident must have proved fatal; but chance favoured the two fugitives, and they traversed the street unchallenged. Once clear of the crowd, the carriage drove through the Rue St Florentin, where some squads of policemen were cowering under the colonnades of the Ministry of Marine, behind the railings, exposed to missiles of all descriptions thrown at them by detached parties of rioters, who were inaugurating the new rule of Liberty and Equality, more solido, by smashing lamps and windows, tearing down railings, and of course pelting the guardians of order, who were

presumably opposed to these manifestations of individual liberty.

On coming out of the Rue Florentin into the Place de la Madeleine, the carriage drove through a quiet, half-deserted quarter to the residence of M. Besson, a Privy Councillor whose name and address had been given to the driver by Chevalier di Nigro, the Italian Ambassador, as that of a trusty and loyal adherent and friend, who would not fail the Empress in the hour of danger and of her greatest need.

On arriving at the house, situated in the Boulevard Haussmann, the ladies alighted, and paid and dismissed the driver; but they entered only to find that M. Besson and his family and servants were absent, leaving apparently the janitor of the house uninformed of their

whereabouts.

Utterly weary in body and mind—for the strain of the last week was telling on her now—the Empress sat down on the steps of the staircase to rest a while and think over what was best to be done. Once more the necessity of a speedy decision faced her—the fugitives must find some refuge before nightfall. They could not even remain where they were without exciting suspicion and provoking discovery; nor could they parade the boulevard, where the Empress, in spite of her drawn-down veil, might be recog-

nised by her gait and figure.

In this dilemma the name of Dr Evans flashed across her mind. He was an American dentist whom she had known when she had been only Mademoiselle Montijo, and who had attended both her and the Emperor professionally for many years, and was a personal friend. Dr Thomas Evans had, moreover, all the energy and resourcefulness of his countrymen, and had displayed these qualities in an eminent degree in establishing on new lines the ambulance for the wounded. He was no fair-weather friend, but a staunch and true one, as the event proved. Further, his long residence in France, and his knowledge of the language, customs, and character of the inhabitants, added to his personal popularity, would enable him to give valuable assistance in any plan of escape. These considerations decided the course the Empress took. Putting aside the suggestion of Madame Lebreton to take refuge at the American Embassy, she hailed the first passing fiacre, and drove to Dr Evans's villa. The doctor was out, but the two ladies were admitted and ushered into the library, to wait for his return.

Dr Evans's surprise on seeing the Empress and Madame Lebreton may be better imagined than described. Events had followed so swiftly each on the heels of the other that the invasion of the Tuileries, the flight of the Empress-Regent, the utter collapse of the Empire, were facts of which he may have heard vague rumours, all except the last, of which he was quite ignorant. The doctor placed himself unreservedly at the disposal

of the Empress. After ordering a collation for his two guests to be served in the library, Dr Evans left, and with a friend, Mr Crane, with whom he had been driving in the Parc Monceau, a plan for the escape of the Empress was arranged. It was ultimately settled that the fugitives, accompanied by the two gentlemen, should leave Paris early the next morning for Deauville, where Mrs Evans was staying As one of the gentleduring the summer. men was in possession of a passport issued by the British Embassy on behalf of an English medical man in attendance on a lady patient, it was agreed that the Empress should personate the invalid, Mr Crane the medical attendant, Madame Lebreton the nurse, and Dr Evans was to play the part of brother of the sick lady. This plan had the advantage of being simple, while it did not depend for success on the doubtful and uncertain co-operation of third parties; and it presented good chances of success if deftly carried out. There would be the chapter of accidents of course, but these had to be risked.

The necessary preparations were completed over night, so that the party were able to start at dawn of day in Dr Evans's carriage. At the barrier they were stopped by the official in command of the guard at the gate, who inquired of Dr Evans who they were and where they were going. The doctor, adroitly screening the Empress with a newspaper he was holding, replied that he was an American going on a jaunt with some friends, with the intention of spending the day in the country. 'Pass on,' cried the official to the driver, and the first danger was over.

The carriage rolled on swiftly and smoothly on the Pacy route, traversing St Germain-en-Laye, the old hunting lodge of Louis the Twelfth, without incident. The weather was perfect, and the heat very bearable in the early hours; but about ten the freshness of the morning was succeeded by that heavy, sultry heat peculiar to the end of August and beginning of September. The fugitives and their escort were now feeling hungry; the Empress and her companions had only taken a cup of black coffee and a slice of bread before starting, and had not brought with them any food. Fatigued and half-famished, they halted at a small roadside inn about seven miles from Mantes. The ladies remained in the carriage, while the two men entered the inn to cater for the party. All they could obtain was bread, cheese, and Bologna sausage, of which they all, with their whetted appetites, partook heartily. After discussing their frugal lunch they proceeded on their way to Mantes, where Dr Evans, leaving the landau outside the town. went in quest of another vehicle to carry the party as far as possible on the way to Deauville.

Dr Evans was successful in procuring a roomy

coach, which would convey them for thirty frances to Pacy-sur-Eure, but no farther; and the landau was driven back to Paris.

At Pacy they had to exchange their comfortable coach for a ramshackle concern drawn by two wretched hacks, with an equally shabby and surly driver, engaged by Dr Evans probably for the purpose of throwing their pursuers, if they were pursued, off the scent. Certainly a more unlikely conveyance for a sovereign could hardly have been found in the whole length and breadth of France; indeed, it resembled a gipsy's van more than anything else. But if shabbiness was required, surliness was certainly not, and Dr Evans found that in this respect they had got more than he had bargained for. Moreover, several disquieting incidents, though unproductive of grave consequences, contributed to render the last portion of the journey even more harassing than the first. No sooner had the old vehicle creaked out of Evreux than the Jehu, a Norman peasant, stopped at a public-house outside the town to bait his horses and refresh him-The coach was still standing opposite the cabaret when the four travellers were startled by the appearance of a band of the National Guard. shouting 'Vive la République !' but they passed on their way without even glancing at the shabby, discoloured, crazy old van drawn up opposite the cabaret, in which the Empress and her companions sat in an anguish of suspense; for their first thought had been that the news of their flight had been telegraphed to Evreux, and that they were pursued.

The driver, having certainly refreshed himself, and perhaps his horses, consented, with much grumbling, to move on. They had not proceeded far when the swingletree snapped, causing a delay, and involving more grumbling from the surly, sulky peasant who was acting as driver, and who vowed that he could go no farther, as he had not the wherewithal to repair or replace the broken swingletree; but Dr Evans and Mr Crane, unheeding his protestations, ransacked the lockers of the vehicle, and found a leather thong which had served as a bridle, with which they fastened the swingletree to the cross-piece. Then, mounting on to the box, Dr Evans ordered the man to drive on. This he did very unwillingly, and the crazy conveyance crawled on along the identical route over which Louis Philippe, another royal fugitive, had travelled in 1848 on his way to exile.

At about ten the calash, as the driver insisted on calling it, lumbered noisily into the cobbled lane of a large village called Rivière Thionville, and stopped before a hostelry, which they entered in fear and trembling, for the public-room or hall was crowded with drinkers; but the sick lady, bent and limping slightly, passed safely through, supported by the two gentlemen, while the sicknurse brought up the rear.

The Empress and Madame Lebreton had their

meal served in a private room, while the two men dined in the common hall, where they remained until the shutters were put up and the inn closed for the night, when they too retired.

Next morning at daybreak the party were afoot, and on their way to the small railway station. They had intended to hire some wheeled vehicle; but the landlady of the inn had expressed great astonishment at the idea of any invalid, much more one in the weak condition of madame, hardly able to move, undertaking a journey over rough roads perhaps in a sorry conveyance, instead of taking the train and travelling in a comfortable car. The gentlemen should try to dissuade her from such a mad plan; indeed, the good woman waxed so energetic in her opposition that, fearful of exciting suspicion, they resigned themselves to the risks of a railway They had to run the gauntlet of curious eyes that watched them at two stations, where they were obliged to change trains; but fortunately nobody recognised the Empress behind

The party arrived safely at Lisieux; but the weather had broken, and there was a steady downpour, against which they had not even the protection of an umbrella; so that when the two gentlemen went in search of a coach the Empress and Madame Lebreton took refuge under a porch. While they were standing there, a young man, seeing their plight, brought them chairs out of an adjoining shop. The lad remembered the fact long afterwards, when he had heard the story of the escape of the Empress, and of her having passed through Lisieux: how he had offered a seat to a veiled lady, dressed in black, standing under a porch, whom he had taken for a casual passer-by caught by the rain, but who was that erstwhile fair and brilliant sovereign lady who had shared the throne of France for fifteen years, and who had quitted her imperial residence only forty-eight hours before.

This was the last incident of the journey, the last trial of the fortitude the Empress had displayed throughout. The final stages of the journey were exempt from perils, though not from discomforts. From Lisieux they drove to Deauville, where the imperial fugitive was welcomed by Mrs Evans in a comfortable suite of rooms at the hotel where that lady was staying; and the next night the Empress, with Madame Lebreton, embarked on board the yacht of Sir George

Burgoyne, in which, after a long and stormy passage of twenty-four hours, they reached Ryde on the 8th of September, at about four in the morning, exactly three days after their departure from Paris.

The escape of the Empress was due mainly to the energy, devotion, and forethought of Dr Evans, aided by good fortune, that uncertain but necessary factor of success without which, as Napier truly observes, the wisest designs are like bubbles on a troubled sea; and, lastly, in no small measure, to the courage, self-control, and adaptability of the Empress herself. The absence of the mistakes that had thwarted the escape of the luckless Louis the Sixteenth in 1791 had secured the success of the measures taken by Dr Evans. There had been no such confusion and delay in starting as marked the departure of the royal fugitive in 1791; there had been no Drouet in the path of the Empress to recognise and stop her; there had been no self-betraval or self-revealing as in the case of King Louis. who showed himself unadvisedly twice - the second time with fatal results-at the carriage window. The Empress also implicitly conformed to the advice of those who were risking so much on her behalf, while the excellent but irresolute king had hampered and hindered at every turn the free action of those brave men who were hazarding their lives for their king and would have saved him had he allowed them.

Over forty years have elapsed since the Empress Eugenie quitted the Tuileries for ever, and took refuge in exile—forty years of bereavements, of sorrows, of painful recollections, following on fifteen years of glory and power. No life has presented sharper contrasts, and few women have been tested by the smiles and frowns of fortune as has the Empress Eugenie; fewer still have stood the double test more nobly. Beneficent. gracious, kind in prosperity, dignified, courageous, and self-resigned in adversity, she claims our sympathy and our respect both as the Empress of France and as the widowed mother and childless widow. She moves across the stage of history as one of its most tragic and attractive figures, as one who has been-in spite of her beauty, kindliness, grace, and tactfulness-the sport of fortune and the object of unmerited popular contumely. But considerations of this kind would lead me too far; my object has been simply to tell the story of her escape.

A KNIGHT ON WHEELS.

CHAPTER VIII. - THE HAMPSTEAD HEATH CONSPIRACY.

HE was right, but it was touch-and-go. Peggy was climbing down from her gate as Philip cantered up. 'Hallo, Pegs!' he said breathlessly.

Miss Falconer greeted him coldly. 'Hallo!' she replied. 'Going for a walk?'

'What walk?' asked the bewildered Philip. 'Didn't you expect to meet me?'

'Certainly not. Why should I? I wasn't thinking about you at all,' replied Eve's daughter.

'But you promised to meet me here at half-

past three,' cried Philip in dismay.

'And now it's a quarter to five!' blazed Peggy, abandoning her strategical position, woman-like, in order to score a tactical point.

Sure enough, the sound of a church chime fell musically upon their ears through the still

evening air.

I'm awfully sorry,' said Philip.

'It doesn't matter at all,' replied Peggy, still

inflexible. 'Good-night!'

'Good-night!' said Philip quietly. He was constitutionally incapable of forcing his society where it was not wanted. He turned to go. 'It's a pity I'm late,' he added regretfully. 'The most exciting things have been happening, and I wanted to tell you about them.'

The small damsel's hauteur melted in an instant. She deliberately resumed her perch

upon the gate.

'You can come and sit up here if you like,'

she intimated, holding out her hand.

Philip accepted the invitation with alacrity, but the touch of Peggy's froggy paw brought a look of concern into his face. 'I say,' he said, 'you are cold! Put on my greatcoat.

Peggy declined. 'You'll want it yourself,'

she said.

But Philip was insistent. 'You simply must,' 'You are shivering all over. You he urged. can give me a corner of it to sit on if you like.'

The argument came to an end, and presently they were installed side by side upon the gate, hike two sociable sparrows. Peggy, whose teeth were chattering, snuggled gratefully into the warmth of the big coat; while Philip balanced himself on the rail beside her, sitting on a very liberal allowance of corner.

'Are you comfortable now?' he asked.

'Yes,' said Peggy gratefully. 'I'm glad you came,' she added with characteristic

honesty.

'Why?' inquired Philip. He did not know that one must never ask a lady for her reasons. But the little girl answered quite frankly, 'I was getting frightened.' And she slipped her

arm round Philip's neck.

If Philip had been to a boys' school he would have received this familiarity with open alarm or resentment. Being what he was, nothing but a very gallant little gentleman, he responded by putting his own arm in a protective fashion round his companion's slim shoulders.

'Now we are all right,' he said comfortably. 'Tell me your news,' commanded Peggy.

Philip related the whole amazing story. listened breathlessly, her eyes and lips forming three round O's. When the recital was finished, she remarked, 'She must have been the lady mother meant when she said that was the question only one woman could give the answer to, only she never would.'

'Yes,' said Philip, catching the general sense of this unusual passage of syntax. 'It was the same name—a funny name—Vivien.'

'How do you know?' asked Peggy curiously. 'Uncle Joseph told me all about her,' re-

plied Philip. 'I forgot you hadn't heard that bit.'

And at the pressing invitation of Miss Falconer he recited the tale of Colonel Meldrum's love

Peggy's verdict came hot and emphatic. 'She was a beast to treat him like that.

'Well, she has come back to him in the end,' said broader-minded Philip.

'Will they get married, do you think?' asked Peggy, all in a feminine flutter.

Philip pondered. 'I suppose so,' he said at

last. 'But they are pretty old.'
'If they do,' continued Peggy, 'what will happen to you?'

Philip pondered again. Life had suddenly turned a corner, and new vistas were opening before him. 'I don't know,' he said slowly. don't want to go back home at all. For one thing, I don't see how I can. I have broken an order. I told Uncle Joseph about meeting you, and he forbade me to speak to you again so long as I lived under his roof. I shouldn't have come this afternoon.'

'Oh!' said Peggy reproachfully.

'You can't disobey an order,' explained Philip 'But when I saw Uncle Joseph and the lady—like'—he coughed modestly—'like the way they were, I thought I might.

'He had broken his own orders,' observed

Miss Falconer jesuitically.

'Besides,' continued Philip, 'I am not going to live under his roof any longer. I hate it all so.

'Hate what?'

Philip recollected himself. 'The work I have to do,' he said. 'I used to like it once; but now-now I don't think it is very good work. Anyhow, I hate it. I can't go back to it. I only went on because—well, because of Uncle Joseph. He was very good to me, and I was of some use to him.'

'My dear, he won't want you now,' said Peggy

shrewdly.

Philip was conscious of a sudden thrill. 'Won't he?' he said. 'I never thought of that. Then I needn't go back!'

'You'll have to go somewhere, though,' observed his sage counsellor. 'Where are you going

to?

'I should like to go about a bit. I have never even been to school. I don't know any other boys. I want to grow up and be a man, and travel about all over the world,' said Philip, his eager spirit dashing off into futurity at once.

'I see,' said Peggy, suddenly cold again.

'Yes,' continued Philip. He was fairly soaring w. 'Have you read "The Idylls of the now. King"?'

Peggy shook her head blankly. 'No,' she said. 'Is it a story?'

'Yes. It's all about a Round Table, and some knights who met there. They used to ride out and do the most splendid things."

'What sort?' asked Peggy absently. sudden revelation of the eternal masculine in Philip, exemplified by his desire to roam, had stirred the chords of the eternal feminine in herself, and her thoughts were wandering.

'Dangerous things,' explained Philip enthu-

siastically.

'What for?'

'Well, they very often did them just out of bravery; but the very best things a knight did were always in honour of his Lady.

'Oh! Then you would require a Lady?' said Peggy, growing distinctly more attentive.
'Rather!' said Philip. 'To serve, you know.

Whenever a knight performed any great deed he wouldn't care anything about himself. He would just feel he had done it for his Lady, and she would reward him.'

'How?'

Philip's brow wrinkled. He had not considered the point before. With him, service always came far above reward. 'Well,' he said at last, 'she would praise him, and go on being his Lady, and nobody else's.'

At this point in the conversation Philip was conscious of a sudden constriction round his

Peggy appeared to be about to make some remark; but she relaxed her arm again, and inquired calmly, 'When are you going to begin?

'I shall have to grow up a bit first, I suppose,' said the prospective Galahad regretfully. I don't want to go back to Uncle Joseph till then.'

'Why should you?' urged the small temptress at his side. 'He won't require you now that his Lady has come back to him. You are free to be anything you like.

'The difficult part,' remarked the practical Philip, 'will be to make a start at being anything. To begin with, I don't know where thing.

to go.'
'Come to us,' said Miss Falconer promptly. Swiftly she sketched out her plans to her mesmerised companion. 'I will take you up to the house now,' she said. 'I will put you into the studio. Dad is never there after dark. You can stay all night '-

She paused, and turned to Philip inquiringly. 'You won't be frightened?' she inquired halfapologetically.

'Knights are never frightened,' replied Philip

axiomatically.

'You can sleep on the model throne,' continued Peggy, taking all obstacles in her stride. 'I will bring you in some supper, and no one will know. Then, when mother comes to see me in bed, I shall tell her about you, and we will settle what to do next. But you mustn't-not on any account—let dad see you, or he would have one of his tempers. Come on!

It was almost dark by this time, and Peggy's voice had sunk to an excited and ghostly whisper. She dropped off the gate, dislodging her com-panion—who, it will be remembered, had been accommodated with a seat upon a portion of her apparel-with some suddenness.

'We are rather late,' she said. 'I am not allowed to stay out after dark. Let's run!

Give me your hand.'

They trotted through the gloaming, and presently came to a house standing by itself, well back from the road. Breathing heavily, the two small conspirators stole round to the north side of the house, and presently came to a halt close under the wall. Above their heads, eight feet up, Philip could see a small window. It stood open.

'Take me on your back,' said Peggy. 'Stoop

down.'

Philip obeyed.

'Keep quite steady!'

By dint of much struggling, the agile Miss Falconer succeeded in working her small but sharp knees on to Philip's shoulders.

'Now!' she whispered at length, 'stand up

slowly, with your face to the wall.'

Philip straightened his back laboriously, his fair burden maintaining her balance by clinging to his hair with both hands.

'This is a splendid adventure!' she whispered. 'Rather!' gasped Philip, with tears in his

'Now I am going to stand on your shoulders,' explained Peggy. 'Bend forward a little, with your hands against the wall. Keep your head well down, or I may tread on it.'

Two minutes later the soles of the young lady's shoes removed themselves from Philip's shoulderblades with a convulsive spring, and followed their owner in a harlequin dive through the open window. There was a dull thud upon the floor inside, followed by a brief silence. there was the sound of some one moving in the dark, and presently a French window farther along the hall swung open with a click, and Peggy, tousled but triumphant, dragged her guest into the house.

The window closed, and a flood of electric Philip looked light swept away the darkness. round curiously. He had never been in a studio before. The side of the room at which they had entered was built out in the form of a penthouse, and was roofed with glass. In the middle of the floor stood a small platform covered with a rug. On the platform stood a sofa, and on the sofs reclined an eerie figure, like a gigantic Half-finished canvases—prospec-Dutch doll. tive wolf-scarers, no doubt-leaned against the walls. In a corner lay an untidy heap of robes and draperies. Upon an easel close by the throne stood an almost completed picture. It represented an infant of improbably angelic aspect asleep in a cot, in company with two golliwogs, a mechanical monkey, and a teddy bear.

'That,' remarked Peggy professionally, 'is a wolf-scarer. It's called "Strange Bedfellows." It's very pretty. It's nearly finished. This thing here is a model throne. You can sleep on it to-night. Nobody will disturb you. Dad never comes here until after ten in the morning, and none of the maids are allowed in the studio at all. You will be quite warm. I'll get you some of these robes and things out of the corner. O-o-h!'

Philip, fascinated by his surroundings, had not yet had time to notice his hostess. Now he turned quickly. Miss Falconer was in a somewhat dishevelled condition. Her red tam o' shanter was white with plaster, her frock was stained all down the front, and one of her stockings had been cut open right across the knee, displaying a crimson bruise which threatened to deepen into purple.

'You have hurt yourself!' cried Philip in

great concern.

'I got a bit of a bump dropping through that window,' admitted Peggy, indicating the aperture through which she had gained admission to her home. 'But it doesn't hurt much, except when I bend my knee suddenly. Now I must go and have tee in the schoolroom. When I see

mother I shall tell her about you, and she will know what to do. If you hear anybody coming, turn out the light and creep under the model throne. It is hollow underneath. I have often been there, playing at robbers with myself.'

Philip turned up the overhanging drapery, and dubiously surveyed the grimy recesses of his

last refuge.

'Supposing I get underneath,' he inquired, 'and it turns out to be only you?'

Peggy considered. Then her face dimpled. The game of conspirators was indeed exhilarating.

ing.
'I shall knock seven times on the floor with a stick,' she announced, 'before I come down the passage. Then you will know.'

'That will be splendid!' agreed Philip. 'You are awfully clever,' he added admiringly, as the directress of his fortunes turned to go.

Peggy swung round again, with her fingers on the door-handle. A sudden rush of colour swept across her face and neck, and for a moment her wide brown eyes met Philip's. Then the lashes dropped again. 'I say, Phil,' she said shyly, 'I'll be your Lady if you like.'

Next moment she was gone, and our knight, feeling that he had been somewhat remiss in not having made the suggestion himself, was left listening to the sound of his Lady's feet limping down the passage.

(Continued on page 132.)

THE BETTER HALF.

By Mrs G. ROBERTSON-GLASGOW.

IT is difficult sometimes to believe that this is the same world into which the Heir of Redelyffe was born, or Amelia Sedley, or Jane Eyre. The feminine voice, which used to be soft and low, is sometimes undeniably shrill, and seems to be for ever asserting itself, until the world is full of sound. Women have awakened, first to their wrongs, and secondly to their rights; and in their impulsive, headlong fashion are creating for themselves new outlooks, new spheres of interest, new professions, complacently asserting themselves to be the equals, if not the superiors, of those bewildered fellow-creatures who, with the courage of my opinions, I should describe as the better half.

Fifty years ago men were assumed to be the predominant partners in their homes. They managed all the business, and they were responsible for the income. They were, outwardly at least, masters in their own house; though, behind the purdah, in the West as well as in the East, feminine influence was never a negligible quantity. They did all the unpleasant things that women did not want to do. They got up early (always an unpleasant duty), and, with

dreadful monotony, pursued the dull round of business or profession until it became a habit. Well or ill, interested or uninterested, it was impossible for them to shirk their duty, because no one else was capable of performing it. They were the family wage-earners, and women were not then, even partially, self-supporting; the man was, and still is, the one to carry the burden and bear the blame of failure in the finances of family life.

If the girls of the house did not marry, they clung to the father of the family like Old Women of the Sea as long as he lived; and he realised, sometimes with equanimity, but more often with growing anxiety and dismay, that after his death they would be shaken out of petted, sheltered, peaceful, and sometimes very dull homes into the great maelström of a quite unknown world, to sink or swim, to marry or to struggle on with lessened means as best they could.

It was a life that surely no one, not even a really good man, would have *chosen*; so full of petty cares, of vicarious worries lurking behind his professional zeal and the happiest of family ties; the fear of ill-health, of failure, of death,

which would leave behind a helpless wife and unprotected children. I do not think that women always realise the dreadful responsibilities of a man's professional work when the family bread and butter depend on it. When a woman works she generally works for herself only—which is a perfectly different thing. It is comparatively easy to sit by an empty grate by one's self, or to be hungry alone; it is a clamouring, hungry family, demanding fire and food, that is the driving-power behind a man. Women can do a great deal to help; but they cannot as a rule pay the piper, so it is only a concession and not a right when they are allowed to call the tune.

And if a man's working life is full of terror for the average woman, what of his amusements? To be obliged to be a 'muddied oaf' or a 'flannelled fool' at the will of a parent or a schoolmaster, to be kicked and hacked in winter with no redress, or to run about a cricket-field on a hot summer day at Lord's when you might be doing things so much more amusing! It is unthinkable; for the women who like games or are keen on sport are really a small minority. But mercifully one compensation seems to have been given to men, and they enjoy it.

But then, when men have done so much for us, why are we not grateful? Why do we write columns to the newspapers about ourselves, and our most useful work, and most inspiring ideals, and never once mention men, who zeons ago did all that we are doing now, and have never faltered since; who pass through the cleansing fires of matrimony without imparting to every one that they are not altogether satisfactory, perhaps even without finding it out; who have been the ladders by which we have climbed to our superior positions, but which we are hastily kicking away when we are only half-way up?

The friendship of men may not always be safe,

because love is so apt to rise like a flame from its ashes; but their companionship is very helpful, very stimulating, very delightful. We turn to them instinctively in physical danger; we trust to their reserve and silence in the things that really matter; we demand from them strength and courage, self-control and unselfishness, as our right. We take without a qualm their uttermost farthing of generous giving, and in return—Well, that is a question we must all answer for ourselves. A fish or a serpent? Bread or a stone?

When I look back and think of the men who have made life full and interesting, it seems incredible that we can forget them, or persuade ourselves that there is only one sex worth re-What do we do that men cannot cognising. do as well, or better? What can we win that they have not conceded to us? In youth they added to the joy of life, to its romance, to its excitement; afterwards they gave us a wider horizon, a different point of view, a confidence and companionship which is a contrast or a compliment to ourselves. They have their faults, but it is ungracious to remember them; the flame of sentiment dazzles us in youth, so that we do not really see them; the ashes of dying fires lie tenderly over them in after life-fires that not all the 'waters of destruction' can quite extinguish. It is nonsense to pretend that we are sufficient to ourselves, because even we do not really believe it. Men could do without us much more easily than we could do without them; though I hope they would be too kind to acknowledge it. One could imagine a happy land where only men were admitted; but a women's kingdom is unthinkable, for the truth is that though we may be restless at times, and say and believe that we are not really happy with them, we are never really happy without them!

THE TILERIES STACK.

CHAPTER IV.

BUT there was healing in Mary's eyes for the old man's craziness, as well as unbearable reproach and pain. Suddenly the fingers of his great hands clawed the air and then the rope. 'Bide wheer you be, my love!' he cried huskily. 'Keep quiet and dunnot stir one of thy dear feet.' After which he shouted, 'I'll be with thee in a tick, young Jimmie Bishop!'

Before the words were uttered he was on the rope, and it seemed to Mary but the fraction of a tick more ere he was alongside Jimmie on that cornice-edge. And in the next tick or two he did one of the most remarkable things he had ever done in his lifetime of deadly risks.

'Daddy, be careful!' said Mary softly. She pressed her hands to her breast. She knew nothing about the state of mind or body of

Jimmie, reclining there so strangely still and silent, but it was as manifest as both the loved heads beneath her that their two lives hung upon a thread—that is to say, if Jimmie started forward.

Straddled across him on those few inches of foothold, having first stooped and put his hand to Jimmie's heart and nodded as if he were pleased, the chimney-jack was pulling up the rope. He stood as steady and almost as straight as the long reach of the stack itself, watching Jimmie as a hunter would watch as much as he could see of an ambushed lion. Thus, drawing in the rope, and poised as untroubled by nerves as a fly, he comforted his daughter. 'Skeered out of his senses—same as a faint—that's all that's amiss wi' him, my love!' he called up to her confidently.

Then the end of the rope was in his hand, and he quickly nudged it behind Jimmie's waist, brought it round twice, and knotted it fast.

'Do for him, that ought!' he said, and almost before Mary could guess about his next proceeding he had unstraddled and then stridden the six or seven farther feet of the edge which separated him from the uprights of the scaffold. He clambered up the nearest of these without a pause, like an agile old ape, and then, hugging Mary's face to his broad chest, and patting her shoulder, chuckled these words as it were to the lightning-rod behind her back: 'Now us wunna be long, lovey, and a drop o' spirits'll mek his wheels go round ag'in, sure as gum! You come in the very nick o' time, the Lord be thanked. Amen!'

'Amen!' echoed Mary.

He almost stifled her in his embrace. Nor did he release her altogether until she was seated to his satisfaction on that summit boulevard by the cross-pole to which the rope was attached, ready, as he said, 'for what you'm about to receive, my love.'

She soon received it. Jimmie was hauled up as easily as a truss of straw and placed on the stonework with his head handy for Mary's lap.

Standing over her and the little flat brandybottle he had given her, the old man would then at once have made complete confession if she had let him. 'I'll tell thee the whole yarn, and no lies, so far as I'm in it, my love—wicked sinner that I be!' he began.

But she wouldn't let him. 'I don't want to hear it!' she said, darting him a full-faced look.

Never had the old man seen her so beautiful. Though she spoke rather impatiently, there was a smile on her face which could mean nothing but happiness.

She coaxed more brandy between Jimmie's lips; while, thrusting his hands into his pockets, Phineas lurched away toward the ladder-top. He wrinkled his brows at the Tileries yard beneath him, then lurched back and said, 'I meant to kill the lad, and he knows it.'

'Yes; but you didn't do it.—And you'll forgive him, won't you, Jimmie!—And no one else will know, daddy, except just us three, so it doesn't matter.—Does it, Jimmie!' said Mary composedly to the ashen face in her hands.

'Ay, but he'd not wed thee now if thee'd millions o' money, my wench,' urged Phineas, as from the pit of despair. 'Maybe if I was to chuck myself over'——

'Hush!' said Mary, raising a warning finger.
And then she made a screen of her arms for
Jimmie's eyes in their reopening, the signs of
which she had discerned. She bent over him,
too, and her hair fell as a further screen—a
glossy brown silken curtain—betwixt him and

the exciting world of consciousness.

Thus when his eyelids parted he saw her face in a kind of private shadowland, and nothing besides.

But his brain was still weak. His eyes were vacant, and scarcely open ere they closed again, and he seemed to shudder.

'Don't you know me, dear?' Mary asked, and lifted her head a little.

He looked again. 'Why—hello—it's Mary!' he murmured. 'What the—what's your hair down for? I've had such a rotten dream.'

'Yes, Jimmie; and you must have some more physic for it. Lie still, please. *Please*, Jimmie! You're not able yet!'

But, able or not, he rose sufficiently to understand that it was no dream. Then back he slipped into her arms. 'How—awful!' he gasped, and lay trembling in that warm haven for a second or two. Then he roused again and said sharply, 'Where is he?'

Jimmie turned his face and saw him. Old Phineas had receded to the ladders again. He stood there like a prince of golliwogs, his hands twitching by his sides, his chin-bearded mouth open, and abject misery in his eyes—a magnificent tonic for any one with an imagination and that priceless gift of humour which enables a man to sink his own personality in rich enjoyment of an eccentric fellow-creature!

Other forces were in operation upon Jimmie for his soothing, but he was unaware of them at the time—Mary's arms, her breath on his cheek, and the love shining through the tenderness and strength in her eyes. All he knew quite certainly just then was that Phineas was a unique object. His smile broadened. The chimney-jack winced visibly at it, made a clumsy step forward, and stopped.

And then a little more of Mary's magic came into play, and the curtain began to fall smoothly upon the tragedy of the Tileries stack.

'Say something nice to him, Jimmie—poor daddy! .He's so ashamed of himself!' she whispered.

Jimmy said something nice to her first, with the light of intellect and courage, and something better than either, in his returned gaze at her.

'Ashamed!' he cried. 'What about me, then?' He caught up her hand and kissed it. 'Darling!' he murmured.

'Thank you, Jimmie!' she said very simply.

'Yes; but that's only a start,' he continued ardently. 'Wait till we're on good old mother-ground again, and I'll kiss the dirt on your feet—I mean on your dear boots.'

'I'm sure you sha'n't, Jimmie,' she said, sparkling faintly. 'But do make it up quickly with father! We've got to get down. It was bad enough coming up, wondering'——

'Ah!' said Jimmie, scrambling to his feet.

He marched towards the staring chimney-jack between the two abysses, as unconcerned about them as Phineas himself.

'Mr Ridley,' he exclaimed, with a blithe smile and his hand extended, 'we've both been off our chumps a bit. Let's forget it. Shall we?' The chimney-jack gurgled like a water-tap trying to do its duty against strong opposition.

'What's that, sir? I didn't quite catch it,' said Jimmie, inclining an ear. There was some mischief in his smile now.

'I'm a wicked sinner, Mr Bishop—that's what

I said,' declared Phineas plainly.

'Oh, indeed!' Jimmie laughed aloud. 'My dear chap, what does it matter? I'm another. Every one is, I expect, except Mary. A good job, too. Cut out crime and sin and so forth, and it would be a tame world for some of us chaps who have to write about it. Let us be friends again, the same as we used to be. I'm going to get as rich as Mary in next to no time, and then'—

'Rich!' roared Phineas. 'Her bain't rich at all.' Out came Corser & Jones's letter. 'He've left her nowt worth speakin' about. Read this, Mr Bishop. It come only this mornin'. Read it, lad, and maybe it'll help you to mek some allowance for me.'

Mottled red and purple with emotion, he held forth the letter, his hand trembling as no chimney-jack's hand ought ever to tremble.

But, instead of touching the letter, Jimmie turned to Mary. She sat at his elbow, waiting, watching, silently inspiring. Of course she was.

'Yes, Jimmie,' she said, with a little nod.
'You can't understand daddy's feelings properly, like me.—But don't get so excited, dear. Remember where we are! Oh Jimmie, how could you!'

It was a question for Jimmie to ask himself an hour later, but not then. He hadn't a nerve to trouble him in that impetuous instant. Having clasped her to him and kissed her as she deserved to be kissed, he wheeled round at old Phineas again.

For a lively spell he pump-handled the chimney-jack's horny palm in the hearty, low-class Bidston way, while the old man mouthed in vain attempts at a suitable speech of gratitude and affection.

'If theer's owt on this earth'—— he got forth at length.

And then Mary took them both firmly in hand. There was to be no more nonsense of any unsettling kind until they were all off the chimney.

They sat by the scaffold, and after a few preliminary words arranged for the descent. Mary was particularly anxious about Jimmie, who now remembered the telegram, and gave it to Mr Ridley with a short and frivolous account of it.

'It's the last thing I could ever have fancied your doing, Jimmie,' she said gravely, as if she doubted his tongue and spirits alike. 'Are you sure you didn't get frightened?'

He laughed the thought to scorn. 'Did I look frightened, Mr Ridley?' he asked.

'No, lad,' answered the chimney-jack; 'you looked amazin' spry. But—this telegram, my

love. It's a job at Defford. I dunno what's up wi' Tom Swallow.'

'He's ill in bed, father,' said Mary. 'It was calling and finding him laid up that made me come on to make sure you got the message.—I met the boy, and he described you, Jimmie, and afterwards I saw you going up. But we won't talk about that now.—Daddy get some rope.'

That was how they went down the Tileries stack—roped as if on the Matterhorn.

Jimmie declared that it was an indignity if it was to be done expressly for him; but Mary was stubborn about it; and in fact he was glad enough of old Phineas's linked support at that turn of the cornice.

'Steady does it, lad!' gruffed old Phineas above him here, and from below Mary was ready to guide his feet if they wandered on the brink. It was not the first stack she had climbed; but it should be the last.

'Never another one, after this!' she said fervently when they were safe in the yard, and she had submitted to one more brisk, business-like embrace from Jimmie. 'How could you laugh coming down, dear? You do so puzzle me to-day!'

Jimmie had chuckled audibly two or three times in the last hundred feet. He laughed again beamingly, and then spoke close to her ear.

'What! now, Jimmie—at once?' she asked.
'Yes,' said he. 'I must. I'm in a whiteheat.—And do forgive me, Mr Ridley, if I
cut the blessed thing. You'll never get it
untied at this rate. It came at me like a
mosquito just now—the plot, I mean. There!
Good-bye till you see me in the Lane by-and-by.'

He hacked at the rope with his penknife while he rattled off these words.

Down it fell, and he began to run just as he was. But Mary called out, 'Your hat, Jimmie; you've forgotten it, you mad boy;' and he darted back and into the shed.

He reappeared with her hat as well as his own and the bag, and placed her hat on her head. 'What ganders men are, Mary—my Mary!' he ejaculated, with a smile of supreme contentment.

'Yes, Jimmie, sometimes, dear!' said she. 'But won't you leave the bag for us, if you're in such a hurry?'

'Ay, lad!' said old Phineas, extending his arm for it.

But Jimmie ran off definitely then. 'Hanged if I will!' he cried; and he was soon out of their sight. The man in charge at the Tileries gate removed his pipe from his mouth to proffer a question about such scampering; but Jimmie sped past him with a moderate wave of the bag.

So to the pit-mounds, Prospect Crescent, and Bidston's side-streets, with little abatement of his pace until he was in the town. Here he regained some breath in the shop of Mr Hyam, Bidston's principal jeweller, before proceeding to

the hotel; and in about five minutes he exchanged with Mr Hyam a cheque to the value of twenty pounds for a ring of diamonds clustered round three rubies, which the jeweller assured him would please any young lady. It was to replace a previous ring of quite small cost which Mary had worn when he left Bidston, but the absence of which from her hand had briefly—very briefly—pained him when they were on the stack.

From the jeweller's shop it was only a step to the hotel. 'I want to stay on,' he abruptly informed the official young lady of the 'Chormley Arms.' 'May I have the same room?'

'Certainly, sir!' said she, evidently pleased to see him again; but he was already striding for the stairs, so overmastering was his passion to have the writing-pad on his knees.

Nearly two hours passed. Seated in the saddlebag arm-chair in the middle of that inspiring bedroom, his feet on a copper coal-scuttle, and his face towards the window which yielded the best view of the Tileries stack, he had worked his pencil almost without pause. The carpet was littered with manuscript.

Then came the salubrious relief of a knock at the door, though he did not regard it in that light. He glared round with a frown that would have awed a regiment.

'Deuce take you, Minnie!' he shouted at the opening door. 'Can't you leave a fellow alone?'

But he jumped to his feet the next moment, upsetting the coal-scuttle, and met Mr Westcott's solemn entrance with a boisterous laugh.

'What a joke to take you for her!' he cried.
'So sorry! The resemblance isn't striking, though. I'm going awfully strong. Can't give you more than a minute or two. How are you, sir!'

Mr Westcott shook hands dubiously. He had come to condole and congratulate, not for this kind of levity.

It would not have surprised him to find Jimmie in bed, with whisky and a siphon at his side, in the mistaken London belief that shocked nerves could be thus brought to their normal state of ease. But Jimmie with a strange girl's name on his lips in the midst of such tokens of industry was a real and bad surprise.

'Did you say "Minnie," Bishop? Minnie whom?' Mr Westcott asked very desconishly.

'Oh lor'!' said Jimmie, with pained eyes.
'On that tack, are you, still? My dear chap, if you must know, she's the maid of the inn, and as nice a lassie—but nothing to do with me since we were kids together and sucked the same lollipop.'

'I'm glad to hear it, Bishop,' said the subeditor, becoming instantly genial. 'More glad than I can express to you.' He tried to transfer his hand to Jimmie's shoulder for a fatherly pat, but the shoulder dodged away from him.

'I'm frightfully busy,' said Jimmie, his frown returning. 'What do you want?'

'Ah, youth! youth!' murmured the subeditor. 'Of what are we not capable in the twenties, Bishop? I called here at nine-fifteen, and was told that you had returned to London, and I didn't know you had changed your mind until I met Miss Ridley ten minutes ago. I gathered from her that you and she are reconciled. She didn't exactly expatiate on the subject, but faces tell their tale, Bishop, and I was extremely pleased to'——

'Did she tell you anything about that old chimney?' asked Jimmie sharply, pointing at the stack.

'She said you went up it with a telegram for her father, and that she followed you because she thought it such a strange thing for you to do. I never was more astounded in my life. I should never have given you credit for such audacity, and I don't wonder it upset you. But I understand now.' He nodded a wise head at the manuscript at his feet. 'All for the sake of copy, Bishop! Well, to be sure!'

'Yes, sir, all's very well, to be sure!' said Jimmie softly. 'Glad you didn't see her dad, though.'

'Indeed!' exclaimed the sub-editor, with an alert look. 'Why?'

'Oh, that's our business!' said Jimmie. 'I don't want to be rude to you, but it is strictly entre nous, old chap. By Jove! by Jove! I did have a rum time up there. Foot slipped, you know, and but for him—— There, now, I'm letting some cats out of the bag. It's very singular that none of you saw from here what a mess I got into, but you are such a lot of sleepy-heads, with eyes for nothing but the mud under your noses.'

It was Mr Westcott's turn now to be hungry for 'copy.' 'Bishop!' he said, with quite a youthful glow in his own eyes, 'do you mean it—that you were in really grave peril, and that but for special mercy vouchsafed'——

'Oh, just so, sir!' interrupted Jimmie. 'All that sort of tommy-talk, if you like. It's a fact that if Mary hadn't come up I'd have been in Queer Street; but that's all the detail you'll get out of me for your old Bidston rag.'

'Bishop, my dear boy!' protested the subeditor, excitedly, note-book in hand.

'It's no use!' said Jimmie impatiently. 'And excuse me if I say I've had enough of this, Mr Westcott. My time's money, the same as yours and the chief's. Dine with me to-morrow here, midday, will you! Say "Yes," and let me get on, there's a dear old gentleman.'

The sub-editor didn't like being termed a dear old gentleman. Neither did he like the friendly but forcible way in which Jimmie urged him to the door, chattering on.

'I've simply got to turn you out, sir! It's not true religion, but I can't help that. There are many kinds of devils, and when a fellow can get five guineas a thousand for his stuff,

the pen's one of the fiercest of the lot. Till to-morrow, then; and—don't be cross with me, sir!'

Another moment, and the closed door separated them. Yet another, and the key turned in the lock.

Mr Westcott went downstairs slowly, pensive rather than cross. And after two or three deep breaths of satisfaction Jimmie resettled himself in his chair, pencil in hand. But it was several minutes before his pencil properly got going again. Other thoughts distracted him. 'Yes, indeed!' he said at one time from the midst of these thoughts, 'supposing she hadn't come!' And presently, with much feeling, 'By Jove! it's the best bit of foolery I'm ever likely to be on to!' And lastly, 'We'll live at Wimbledon; she'll like Wimbledon—dear old Mary!'

Then he bent his brows resolutely over the writing-pad, and the filled sheets soon began to resume their flight to the floor.

THE END.

MANÁOS.

By E. SALIS.

THE glowing yellow sunlight streams down from a cloudless sky, and encircles with its terrific heat the city of Manáos. A town of blue-washed, red-tiled houses, narrow streets, and hideous public edifices; a town of artificial gaiety and hollow pleasures, that seems to be continually basking in the sun like a well-fed mongrel, its parasites of disease and corruption dormant until the night throws its dark cloak and shuts out the light. From the moment the sun rises until it sinks below the Rio Negro in the far west, a continual, insistent undercurrent of sound is always present, gradually increasing toward noon, then dying away till the early afternoon: a sound of electric-cars, of hammerings from forges, of creaking carts and panting mules, hoarse cries of negroes, steam sirens hooting, and the creaking of many craft straining at their moorings; at noon a sudden shriek of whistles, then silence which seems to penetrate one's brain like the sudden stoppage of the screw on a liner. Faintly, but gradually, the true sounds of nature and of the tropics make themselves heard: the low swish of the river, the far-away chirp of the many thousands of cicadas, the flutter of pigeons, and the soft sighing of a light breeze through the adjacent forests. Then all is silent; but a faint humming proclaims that a number of hornets have found some sweet bit of sugarcane thrown down beside a fruit-seller's stall. Again the forest sounds become insistent, and a brilliant-hued butterfly flits rapidly up the street.

A curious persistent odour steals gradually from the river, an odour of soiled waterproofs, of human sweat, of sweet herbs gone rotten—the smell of rubber; and this smell arising from the one great product by which the city exists, from the rubber that is, with infinite care, toil, and crime, collected in the valley of the Amazon, typifies the life and aims of the inhabitants of Manáos.

When I gaze on the thousands of balls of rubber piled high in the warehouses, waiting to be shipped to some far-distant port, my mind travels subconsciously to the forest whence this rubber came. The poor Indian savage,

deprived of his land and hunting, is dependent on the goodwill of some wealthy owner of a rubber plantation many thousands of acres in extent, and forced to collect so much rubber before he can pay back to the thieving store his small advance of tobacco and cheap cloth. I see him bending low over the fire of palmnuts, smoking the big ball of rubber that he has collected with infinite care from the trees perhaps many weary miles from his hut. virgin forest is a fitting background for thisits mighty trees, with many clinging creepers festooning each branch, the stately palms rearing their heads above the dense undergrowth of prickly shrubs, here and there a tree covered with brilliant yellow flowers, and near the tiny settlement a grove of cocoa-trees whose dense shade excludes all sunlight. The brilliant, manyhued parrots chatter overhead, and the blackand-yellow paroquets quarrel amongst themselves; the giant lizards dart, rustling, among the leaves; here a wasp's nest hangs from a branch high up on a dead tree; or perchance a solitary crane will flap its leisurely way across the river and settle monumental-like on some coign of vantage, from which its watchful eyes will mark the movements of an Indian fisherman casting his round net from a rickety canoe.

Away flaps the crane as round the distant curve of the river a little steamboat approaches, to call at the stores for the rubber on her way down to Manaos—a little two-decked steamer, her upper deck containing the chart-house and wheel, and a long deal table with benches, on which twice a day the unappetising meal is Tough meat cut into shreds, cooked with black beans and farina, carne secce (or sun-dried beef) tasting like 'high' venison, and watery soup make up the breakfast and dinner of the unfortunate passengers. Below, the afterpart of the deck is hung thick with hammocks, where, reclining at ease, the hundreds of passengers perspire and spit promiscuously around, waiting for the cargo of evil-smelling rubber to be shipped. At last, after many weary stoppages, the vessel arrives at the landing-stage, and discharges the human load of Brazilians, who slink away and hide themselves in the noisome, sewerlike streets of Manáos, the Paris of Amazonas.

As night falls the forest grows dark and mysterious, the black river rolls on silently and swiftly, and nature, wearied with the heat and

toil of the day, sinks to rest, broken only by the insistent hum of sleepless insect life. The moon, shining from the black firmament, looks down on a deserted city, and changes with its silvery beams the ugly houses into marble palaces, creating the veritable El Dorado of Brazil.

THE SNAKE'S EYE.

By BREW MOLOHAN.

SINCLAIR leaned forward in his chair, a look of content on his tanned face. The subdued roar of the traffic pouring westward held his ear.

roar of the traffic pouring westward held his ear.
'How I love that din!' he exclaimed. 'It is such a contrast to the mysterious night-voices of the Brazilian forest.'

'Why mysterious?' I questioned, banteringly.
'Strange, I grant you, but not mysterious. Each of those noises you term mysterious is capable of a logical explanation if traced to its source.'

Sinclair turned to me with a curious smile. "What would you say, Cunningham," he asked, "if I were to show you an object which can be described by no other word than mysterious, something possessed of an uncanny power which admits of no reasonable explanation?"

'I should say you were about five centuries too late,' I answered, laughing. 'The days of black

magic have gone by.

For answer Sinclair rose to his feet and walked into the bedroom, returning in a few moments with a small leather case, which he placed on the table.

I opened it with some curiosity. Inside was a rubber bag which contained a dull red object about the size and shape of an egg. It was a stone of some kind, a monster ruby, I should have thought, were it not that the fire of the jewel was missing.

'What do you think of it?' asked Sinclair.

I started like a man suddenly awakened from a heavy sleep. Incredible as it may seem, during the few seconds that I had been examining the object my mind had suddenly become blank. I was conscious only of an extraordinary twitching of the muscles.

'Er—yes,' I answered confusedly. 'There is some strange power in the stone. For the moment it mesmerised me.'

Sinclair laughed. 'You must see it in the dark to judge of its power,' he said. 'Sit over there in the arm-chair. I will place the case on the table and switch off the light.'

By this time I had recovered my self-possession; and, curious to note the further develop-

ment of the trick, I obeyed.

Sinclair placed a few books on the table to hide the case from his gaze as he stood by the switch; and the next moment the room was in darkness. I had followed his movements; and, glancing toward the table in the gloom, my eyes

were held by a ball of apparently phosphorescent fire. I chuckled to myself. 'This mystery of Sinclair's is nothing very startling,' I thought, as I attentively studied the luminous object.

Was it imagination? The glowing ball gradually resolved itself into a fiery eye, gazing alluringly into mine. At the same moment an overpowering feeling of helplessness seized me, paralysing my will-power; and, more than that, living waves of hypnotism, mesmerism, fascination—call it what you will—drew me slowly but surely to the table. Forgotten was Sinclair, standing a few yards away in the darkness. Forgotten was everything but the call of that speaking eye drawing me as surely as a magnet. I was powerless to resist; indeed, I had no desire to struggle against it.

I jumped upright as a flood of light bathed the room. When Sinclair turned on the switch I was bending over the case, having been drawn right across the room by the power of that unearthly object. As he shut the case I regained

possession of my senses.

'Look at your face in the mirror,' he said.

I stared in astonishment at the apparition that faced me in the glass.

Sinclair moved to the sideboard. 'A drop of brandy neat will pull you together better than anything,' he said.

The raw liquor ran through my veins like fire, and in a moment I was my normal self.

Picking up the case, I examined the object carefully, fighting against the undoubted mesmeric influence that it possessed. Looking closely, I saw a number of iridescent veins zigzagging across the ball, ceasing at the edge of the circle which formed the pupil when the object was seen in the darkness.

'What an extraordinary—er—fossil!' I hazarded lamely.

Sinclair smiled dryly. 'Cunningham,' he said, 'that object is one of nature's mysteries.'

I shrugged my shoulders irritably. 'Switch off the light,' I said. 'The thing worries me because I cannot understand it. I wish to see it again.'

Sinclair hesitated for a moment. 'Well, it can't injure you. Its power for harm died with the snake; but I will only give you a minute.'

I returned to my seat, and as the light went out gripped the arms of the chair steadily. I

was determined that this time, at any rate, my will should not be subjugated by the mesmeric influence. Keeping a firm hold on my senses, I watched the development of the pupil of the eye. I was conscious of a curious dreamy feeling of happiness, which, combat it as I would, gradually increased until my very soul was held spell-bound by the entrancement of that wonderful orb.

Snick / I was half-way to the table when the light flooded the room. I glanced shamefacedly at my host.

He laughed quietly as he shut the case. 'You will admit now,' he said, 'that there are still some things beyond human understanding. Believe me, the man has yet to be born who can explain the power of the snake's eye.'

'It was at the time of the rubber boom,' he began, 'that Boyle and myself—— You remember Boyle? He was up in our year.'

I nodded.

'Well,' he resumed, 'Boyle and myself were in partnership in the rubber trade at San Antonio, a village on the banks of the Amazon about two thousand miles from the sea. As happens in every trade where there is money to be made—and, by Jove! there was some return in rubber just then—every man who had a bit of capital to spare dabbled in the business. We were the only Englishmen in San Antonio, and the Brazilian merchants—jealous, I suppose, of the presence of foreigners—made a ring to freeze us out. I can tell you they required no points from the Standard Oil Company when it came to a question of crushing us.

'Something had to be done if we were not to go under; and one day it struck me that the man who went after the rubber, instead of waiting until the Indians brought it from the headwaters, hundreds of miles in the interior, would prove an easy first, at least until such time as his rivals woke up to the fact that he was scooping the

pool.

'Boyle would have done a great deal to turn the tables on our Brazilian friends; and when I mentioned the idea he was enthusiastic. We both had a nodding acquaintance with the Indian dialects; and José, our half-breed foreman, could make himself understood by anything short of a monkey in the forest.

'As it happened, a forty-foot launch, belonging to a Government official who had succumbed to the effects of the climate and the bad whisky of the country, was for sale just then. She was the only thing in the shape of steam above Manáos; and, putting all our available capital

together, we bought her.

'I need hardly tell you that we were not shouting our plans aloud for the information of the Brazilians. Steam was not so plentiful on the Amazon then as it is now; and securing the San Fernando meant a six months' start before

our rivals could get another launch up from Manáos or Para.

'The San Fernando was practically a new boat; and as we steadily puffed up the river Putumayo she fully realised my expectations. Without pushing her, we made a steady seven knots against the gentle current. Now and again we passed little clearings on the banks, where, no doubt, a trade could be done; but I was out to gain the goodwill of the Indians in the interior by saving them the long canoe journey to San Antonio.

'On the third day we turned into a tributary running away to the north-west. This river was entirely unexplored by white men. It is supposed to rise at the foot of the Andes, somewhere near Quito; but of course this is mere conjecture.

'At intervals of fifty or sixty miles we came across the huts of the rubber-workers, who were only too glad to trade their rubber for the various goods we brought. We could easily have filled up in the first week; but, learning that there were more settlements farther on, and having an eye to the future development of trade, we declined—promising, however, to return later.

'At length we arrived at a remote encampment situated, I should fancy, well inside the Colombian territory. The Indians at this camp, about twenty in number, were a fine, athletic body of men, who varied the monotony of rubbertapping by hunting in the forest with blow-pipes and poisoned arrows. In a short time they had traded their rubber for machetes, gaudy cottons, canned beef, tobacco, and other articles dear to an Indian's heart. The chief, Arara by name, was very friendly, and gave us a cordial invitation to remain as long as we liked. The launch was an object of great interest, and he was never tired of examining her wonders. Arara did not run to much in the way of clothes, but he was a man, every inch of him. He wore a necklace of jaguars' teeth interspersed with shiny black lumps of some substance that I did not recognise. Handling this necklace one day, I was surprised by its weight, and, looking at it more closely, detected a gleam of yellow under the black. In a flash I saw that the irregular lumps were gold, covered with a black vegetable juice to contrast with the white teeth.

'As you know, Cunningham, the whole history of South America centres on the word gold. Fabulous deposits of it there must be; witness the treasure of the Incas. I know of one, as you shall hear.

'To make absolutely certain, I borrowed the necklace, and cleaning off the black paint, touched the metal with acid. There was no

doubt it was gold.

'Calling Boyle, I told him of my discovery, and we proceeded to question the chief. Without demur, he told us that one day, when hunting in the forest, he found the yellow pebbles, as he called them, in the bed of a stream. I asked if

he would guide us there, but he shook his head. It was many days distant, and, moreover, was in the territory of the Waracapuris, a cannibal tribe who have acquired an unenviable notoriety in these regions.

'Boyle and I looked at each other. Somewhere within a hundred miles was a creek where a fortune was to be had for the gathering, and it

was up to us to locate it.

'Arara had been casting eyes of admiration on a Winchester in the little cabin. He was the proud possessor of an ancient muzzle-loader, and the easy action of the modern weapon appealed to his hunter's eye.

'A vulture was settled on the branch of a dead tree some four hundred yards across the river, and, drawing a careful bead, I fired. As the report rang out the heavy bird tumbled headlong from the branch. The chief uttered a delighted, "He! he!" of approval. Turning, I placed the rifle in his hands. "It is yours," I said, "if you will guide us to the stream where you found the yellow pebbles."

'The expression in his eyes told how sorely he was tempted; and when I placed a couple of cases of cartridges, a roll of cotton, and three bottles of whisky beside the rifle, it was more

than his untutored nature could stand.

'Next morning, with two of his followers, he came aboard, and we started up the river. About half the journey could be made by water; then, leaving the launch with the half-breed in charge, we should have to cut our way through the forest.

'After a few hours we tied the launch up to the bank, and, landing, each man packed about fifty pounds, principally of provisions. In addition to our rifles, Boyle and myself carried a

couple of spades.

'The forest met us in a solid wall; but the Indians, machete in hand, stepped to the front, hewing a path through the undergrowth. I had had some experience of the riot of vegetation in the Amazon valley, but never had I seen anything to equal that dense tangle. The foliage overhead admitted only a dim twilight; and it is no exaggeration to say that if we had but strayed a yard from the path we should have been hopelessly lost.

'Next morning we cut through the strip of jungle that clothed the banks of the river, and, finding the ground more open, made good progress. The Indians, taking their course by the sun, advanced quickly; and on the third day the chief led us to a clearing on the banks of a stream that flowed sluggishly through a little valley. The stream doubled on its course in the middle of the open space, leaving a small sand-

bar at the angle of the bend.

'Arara told us that it was in the bed of this creek, two days farther on, that he had found the yellow pebbles. Whilst the Indians were erecting a hut, Boyle and myself took our spades

down to the sandbar. If gold were in the stream two days ahead, some of it should be lodged in that bar.

'Quickly we cleared away the light sand and silt, and lifted a spadeful of the heavy clay. Even as the spade turned it over I saw the gleam of yellow points in the dark mass. It was my first experience of gold-panning, and no doubt I lost a great deal; but when I finally washed away the dirt, there was a glittering trail of yellow dust, interspersed with nuggets running up to the size of a pea, in the bottom of the cooking-pot.

'Boyle gave vent to a long, low whistle. "By Jove, old man!" he said, "I don't think we shall waste two days travelling when all we need

is in this sandbar."

'By night we had washed out about ten pounds of gold, and when we could no longer see to work we returned to the hut and informed Arara that we would camp for a few days. He appeared to be vaguely uneasy; but we were too tired to take notice. Throwing ourselves into our hammocks, we were soon in a deep, dreamless sleep.

'We were awakened at daylight by the chief, who was plainly in a state of horrible fright. Brabo, one of his followers, had disappeared during the night. We judged, of course, that he had either deserted or gone out to hunt.

'But Arara pointed to the weapons lying under his hammock. "Brabo has not run away," he said. "And an Indian does not hunt before the sun has lighted the forest. It is the evil spirit that has called him. This clearing is its abode."

'We searched for signs of the missing man, but in vain. Many tracks of deer and big game opened through the dense growth that walled the clearing, showing that the creek was a favourite drinking-place; but no traces of Brabo could we find.

'Indian superstition is a difficult proposition to handle, and after a consultation with Boyle I turned to the chief. "We will return to the river when we have collected a load of the yellow dust for each man," I said. "If you will help us to-day, whilst Yapu hunts, it will shorten the time."

'You will wonder perhaps that he did not desert. Arara had given his word that he would lead us into the forest and back, and your true

Indian never breaks his word.

'All day we laboured, and by night had cleared up about forty pounds of gold. In the sunlight the chief seemed to forget his superstitious fears; but as the darkness fell they returned with redoubled force, and it was in vain that we tried to cheer him. Yapu had been successful in his hunt, returning with a wild pig, which we roasted over the fire. As the night drew on the Indians were badly scared men, turning from side to side to scan the clearing with anxious eyes.

'When I tumbled out of my hammock next morning Arara was seated on the ground, staring in front of him with unseeing eyes. The man was dazed with fright.

"Where is Yapu?" I asked.

"The evil spirit called him in the night, and

he went," he replied dully.

Boyle and I looked at each other in amazement, an indefinable fear seizing us for the first We almost made up our minds to start back there and then, but the glamour of that wealth in the sandbar held us.

"Arara," I said, "to-morrow we will return

to the river."

'He shook his head. "To-morrow," he replied apathetically, "will never dawn for me.

The spirit will call me in the night."

'That day we were again extraordinarily lucky, and by the light of the camp-fire divided the gold into three packages, intending to start for the river with the dawn.

'As the darkness fell a curious presentiment of danger took possession of us. Arara sat by the fire, his face that of a doomed man; and whether it arose from his fears or not I cannot say, but a sense of foreboding was heavy on us.

'I turned to Boyle. "I am going to watch to-night," I said; and for answer he took his

rifle and sat by my side.

'A brilliant moon lighted the clearing; and as we sat by the fire the passing of the hours seemed interminable. Time after time we started to our feet as a movement in the jungle told of Suddenly a night-prowler searching for its prey. a deep, uncanny silence settled over the forest, and I distinctly felt my attention being drawn to the other side of the clearing. It was as if some influence were willing me to cross to a dark patch which marked the opening of a game-trail. I whispered to Boyle. He was affected with the same desire.

'At this moment Arara, who had been lying asleep near us, gave vent to some piteous sobs, and, rising to his feet, walked straight out of the hut. In an instant we followed, our weapons ready; and I noticed that this diversion of my thoughts partially overcame the strange influence.

'Straight toward that dark patch the Indian walked, still sobbing bitterly, drawn against his will by some overwhelming power. We were almost touching him, when he sank to the ground about ten yards from the opening; and over his body I saw the radiance of some unearthly glow at the mouth of the dark tunnel, the object itself being hidden from my view by a dense growth of foliage. But I saw something more. Immediately above the radiance was a dark mass of coils about sever feet high, from which two glowing phosphorescent balls looked straight

'My sense of danger was preternaturally alert, and, by a mighty effort of will, I thrust forward the automatic pistol and emptied the chamber

of soft-nosed bullets dead at those baleful eyes. The first shot brought Boyle to his senses, and his repeater rang out again and again. With the reports arose a frightful hissing, and a column shot high in the air, falling with a crash into the jungle, where it lashed round and round in agony.

'We gripped Arara by the arms and dragged him to the hut, where, with awe in our hearts, we listened to the crashing of the trees as the unknown monster threshed about in its death-

agony through the long night.

'In the morning the chief was himself once more; and when we told him that we had killed the evil spirit, he was the first to cross the clearing. The trees were smashed to matchwood, and lying there dead was the most gigantic anaconda that surely mortal man has ever seen. I measured the monster very carefully, and found him to be thirty-two feet five inches long and two feet nine inches round the body. figures sound incredible; but I know that my measurements were correct. In his last expiring struggle he had dragged himself back to the place where we shot him, and lying just in front of his head was the object you see there.
'Arara shrank back. "The Power of the

Spirit," he exclaimed, pointing to it.

'As I stooped to pick it up the chief suddenly exclaimed, "Hist!" to enjoin silence. sharp tap-tap of a drum in the distance distinctly caught our ears. The tapping continued intermittently for some moments, with long and short pauses, something like the Morse code.

'Arara listened intently, and when it ceased he turned to us. "We must fly," he said. Waracapuris have discovered us, and that was their signal summoning the hunters from the

forest to the attack."

'I need hardly tell you that we lost no time in leaving the little clearing behind us. We had heard too much about the blow-guns and poisoned arrows of this notorious tribe to risk making their acquaintance. Picking up the gold and a few tins of canned beef, we fled, and, pausing neither for rest nor food, at length reached the launch.'

Sinclair paused, picked up the case, and tapped it lightly with his fingers. 'My theory of this remarkable object,' he continued, 'is that it is provided by nature to enable the gigantic boaconstrictors of the Amazon forests to secure their prey. These serpents are said to live for hundreds of years, and become much too big and ungainly to hunt for food. This fiery ball in the darkness near a waterhole attracts the attention of the animals that come to drink, and, falling

under its spell, they are seized by the anaconda. But the mesmeric influence? I asked. 'How

do you account for that?'

'I have merely opened the book He smiled. of one of nature's mysteries,' he replied. 'Somebody cleverer must read the page.'

THE HEART THINGS. OF

By HENRY LEACH.

LONDON, Yesterday.

A PRETTY contrast in considerations is offered at the moment. We may conjecture upon a possible state of man five hundred thousand years ago and the condition in which man finds himself at the beginning of another hopeful year. There is a kind of reason for it. A piece of news, declared to be of high consequence, has come to us from Buenos Ayres. There are some geologists there from La Plata Museum who have been examining certain excavations made at Mizamar, and they have made a discovery of some 'stone implements and various human objects.' They have seen; they have examined; they have thought; and these wise men, who ponder upon strata and rake up the past of the world, conclude there is proof that man already existed in the Tertiary epoch. Reuter, who does not deal in pure nonsense, cables this news to the present centres of civilisation, and here in one of them we find scientists reflecting upon the discovery, and deciding that it will be of immense importance if there is any evidence that the objects found are of human manufacture and of the same age as the stratum in which they were embedded. Of man in the Tertiary age only scanty and very doubtful traces have as vet been discovered. In 1912 there was unearthed in Sussex what has come to be known as the Piltdown skull, and certain authorities are inclined to ascribe it to this period. The Tertiary age goes back, they say, a hundred and fifty thousand years, probably two hundred thousand, and perhaps even half-a-million years. It does not matter. Practically, electricity and all its works have been brought into the world in the last fifty years; in a score we have made motor-cars, learned to fly by machinery, found out the Rontgen rays and applied them, learned the trick of sailing craft beneath the surface of the sea, and made a way of fastening wings to our written words that they may dart through the air from one part of the world to another without any wires on which to hang. We modern men and women have proved that we can do very much in one year; and so it seems to us, with our ideas of the quickening of time, that a hundred years is long, and two thousand, being more than the period which we have come into the way of looking upon as the whole period of the

modern world, as all past time. But when we consider origins and eternities we are brought to feel that the unthinkable ten and twenty thousand after all are nothing, and the hundred thousand years, which is as difficult for the human mind to comprehend as endless infinity, can be added quietly for safety to a reckoning. So one may take these people who deal, as it were, in old worlds at their most interesting suggestion, and consider there is evidence that there were people at Mizamar five hundred thousand years ago; and that they were possessed of reasonable intelligence is suggested by the fact that they had tools with which to do things that they wished to do. It seems that the beginning of 1914 might be the most appropriate time there has ever been for considering the people of B.C. 498,086 (approximately), their thoughts and ways, their systems of government, their means of communication, their social problems, and their art and literature—as they may have been.

* The very possibility of there being such a space of time may disturb some of our timid people; for when we come to these conjectures near upon infinity we lose grasp of all sense of a beginning, and even the vague idea of creation totters. And, again, if we of the electric age can do so much in a score years, and even in the Tertiary age of half-a-million seasons back they had implements and did things with them, what now must be the fearful progress made in the next few decades? What veils shall be rent from nature's mysteries? Of how much more shall man become the master? The other day we read of doctors and scientific people in Paris being made sure they had found out a way for the prolongation of life. As everybody knows, it is supposed to be all a case of arteries and phagocytes, and if it were not for the aging and weakening of these and other parts of the internal mechanism there might be no death at seventy or eighty or any other age, and the human system of things might be entirely upset-which would be unfortunate and disastrous. We smile at this idea of the doctor-folk giving us such long continuance of life; but science and the doctors have done most wonderful things in the last hundred years, and, now that they have become well started, how much

No. 166.—Vol. IV. [All Rights Reserved.] JANUARY 31, 1914. more should they not do in the next five hundred thousand years? In this channel of thought, the contemplation of the Mizamaras of half-amillion years back brings us to a state of awe and fear. It is not, you may be sure, because of anything that those people may have suffered through their ignorance or barbarity, not because of the pathos of their early circumstances, their highly simple life; though even they, with their 'stone implements and various human objects,' may have feared for their own speed of progress. The sense of fear arises in us in this way, that if there was a world like this so many unthinkable ages back, if it was so real that bits of it still linger, and there are implements unearthed of the people who then lived and worked, then surely one may even dare to think that the world will not continue, and the people with it, for another half-million years. This is not the scientists' conclusion; it is that of the simpler man. We have come subconsciously into the way of feeling that such a thing could not be; and indeed it were perhaps better that it should not, for it sometimes seems that progress made of late has been too quick for good endurance, and that science, and the warring of peoples against peoples and among themselves, with the overpopulation of the world as well, must rush the sphere and all its living things on to some terrific and final cataclysm, when the worn-out and exhausted world will fail and quietly dissolve. It is perhaps not so much that some fear that this may happen in five hundred thousand years as that it may occur much sooner, and that, anyhow, there is ample time to be given for the happening. Those who are too apprehensive already wonder if, with speed increasing ever, the world will even last out their own time.

* * *

But those who have a fear for the continuity of the earth must be reassured by reflecting upon the chance of the Mizamaras having been afflicted with the same dark doubts. They had their problems and their struggles, perhaps, not less aggravating than ours. There must have been leaders among them, and so there must have been discontent, and something in the nature of socialistic ideas may have been preached. Otherwise the Mizamaras in all their early simplicity might have found themselves in Utopia right away, and we should have been falling from the perfect state ever since their Be sure there were maids in Mizamar who fell sick with love and wished to die, that there were men whose minds cracked in the strain of their human strife, and that all of them, looking upon the long distance that even then separated them from the animals, concluded with solemnity that things could not go on much longer as they were. One of the implements that have just been discovered at Mizamar would no doubt have been thought by the natives at that time to be the uttermost thing in human production and creation. It may have made a sensation, or have made it felt that there was nothing more to be done. Convictions of earlier times than ours were just as strong when reached as ours are now; and so we realise that even if we fly, and do whisper round our world, these may, after all, be but trifles in Possibility, that we are but human babies still, and that this young earth at its half-million years is somewhat stupid, rough, and raw. We cannot conceive a continuance of such amazing leaps in knowledge and achievement as those which we have made in the last few years, when science seems in a flash to have changed from a mere theory to a practice; but then the Mizamaras could not think of such a thing as science, and perhaps there is something beyond even science that we have not yet approached, but is more wondrous still. Yes, something beyond science, and more marvellous—incomprehensible now.

Despite a seeming paradox, reactions sometimes hasten progress and steady it; and when one fears for a future world overwhelmed by speed and complications through scientific discovery, may there not be a reaction from science, may not the standard of what is felt to be progress change—for the standard is just arbitrary after all—and may not there be a grand reaction, with man advancing to far higher things through some other medium of work and thought? Indeed, there has been no movement in higher thought in the most recent times that has been more striking, more significant, and more pregnant with future consequence than the new hesitation of science on its march along the road of bare materialism. Always uneasy in its axioms, dissatisfied with its absolutely hopeless ignorance upon the beginning of all things and the fact of life, it seems to make an advance to the world of spirits, of faith, and of belief. That was a remarkable presidential address given at the last meeting of the British Association. A sermon on the life after death it was. It is the leaders of science who have moved first in this reaction. A little while before his death, Dr Russel Wallace wrote a letter to a friend in which he said that life, with its inherent forces, powers, and laws, requires 'a constantly acting mindpower of almost unimaginable grandeur and prescience; and he confessed that, with the experience of age, 'the completely materialistic mind of my youth and early manhood has been slowly moulded into the socialistic, spiritualistic, and theistic mind I now exhibit.' So in such a contemplation there may be hope for those who fear for the world if it is still to speed onward in service for as long as the time that may have elapsed from the days of the Mizamaras.

The world will have always what it wants, if it can be had. Mechanics and science were intensely

attractive when they were younger and less developed. For all the wonders of machinery, the arrangement of wheels that seem to think and act upon their thoughts, has anything that has ever been invented since aroused the same great wonderment, the joy and the satisfaction of discovery, as the first steam-engine? Now people are surfeited; their interest for the seemingly miraculous is hardly more than momentary, and the amazing truth is that they seem to be tired of all this mechanics and all this science. They have found that their lives have been made most fearfully fast and complicated by them, and now suddenly they ask if they have been made happier for it all. Then they inquire anew upon the chief object of life-whether it is to discover more and more in science, and, if so, what is the ulterior object of discovery, for it surely cannot be a pastime of a great Creator merely to arrange a puzzle for solution by the creatures of the world. And if the mere discovery in science is not the object of life, is it not then to be stated simply as the achievement of happiness? This supposition is more satisfying. If that is the grand object, do our modern ways and discoveries conduce to happiness? Is there one single man alive who is prepared to state and show that we live better and happier to-day in either London or Edinburgh than we did twenty years ago; or, supposing that the attainment of personal happiness be regarded as a too selfish ambition, and that more altruism is needed, is there less misery in the world now than there was then; is life a nicer, brighter thing? One tendency of so much machinery and science is to decrease importance of the individual, to stamp out his individuality, and that is to lower the consequence of man and the satisfaction of living. So much is now done, and by so many persons, that achievements are in danger of being forgotten. They have continually to be recorded and classified, and that is why all life comes now to be ticketed and scheduled, and the sense of machinery is so much increased. At this very moment there is a peculiar illustration afforded of the general modern disposition toward ticketing and filing and the making of that perfect order which is represented by ruled lines and figures, in the sudden and large increase of the year-books, or almanacs, or annuals, as they are variously called, which stand for a record of the world as it is, and the work done by men in the world in the past twelve months. Everything is arranged and classified. The work has been done, the facts have been recorded, and here the inventory is made and put away. There was a time when comparatively little of this classification was done. All of us remember how in earlier years there were only three of these annual publications that had any vogue. These were Whitaker's Almanack, Hazell's Annual, and the highly dignified Statesman's Year-Book. But, with knowledge increasing, more work being done, and the world becoming more mechanical, these annuals have even come to be liked. They are popular books; and so a new vogue for such things has come in, and upon the bookstalls there are imitations of every kind telling us in new and attractive ways of all that has been done on earth, and what, as it is surmised, is about to be done.

The consideration by such means of the work done is a peculiarly attractive one. We know the world is wonderful, that it has marvels and mysteries as yet undreamt of, and yet its comprehensiveness and the versatility of its people as already found out are very remarkable. other afternoon I collected four of these new annuals and took them home for examination. It can be promised to any man, without his having any passion for statistics, without his being a politician of any sort or interested in any question of the day whatsoever, that by wandering through the pages of such almanacs in the most casual sort of way, picking a fact from Chicago and another from Pekin, looking in on the Germans with their shipbuilding, and then into Harley Street and the hospitals to see what is killing us most in times of peace and what we are doing to stop this waste, seeing how many weeks of the year our workmen will not work, how the women are making their new heaven on earth and whether they like it, and so on, there is an entertainment, to be varied and adjusted exactly according to taste, very fascinating and hardly to be equalled at any public Here we have a proportion and perspective that in the nature of things cannot be got in the newspapers, and views and knowledge can be exactly adjusted. What must impress every wanderer through these pages is the speed of life and the prodigious amount of work that is done, and yet the constant complaint that life is more difficult, and that the cost of living is higher always and everywhere. One gathers that in general Germany is doing well, that she is suffering less from strikes than she was, that her harvests are treating her nicely, and she is getting stronger. But even in the nice Teutonic ointment there seems to be a wretched fly, for one gathers that they are uneasy because there has been a decrease of 11 per cent. in the birth-rate of the country, and only such a trifling increase as three to the thousand in the population of Berlin-even this being due to immigration—whereas the believers in big Germany desire to see her vastly overpower the other nations by her numbers. More Germans seem to be needed. As one who believes in France, and loves her, I feel less satisfied in contemplation of cold statistics than I do when lingering in Paris and the South. France, I now reflect, is often disposed to be much on the surface, as one might say. From the newspapers only one has not

quite suspected that China is getting on so well as indeed she is; that already the new form of government has worked wonders, so that Celestial John is giving up his Chinese robes and characteristics, and is taking to cloth caps, sweaters, and European wear in general, and has developed a keen fondness for the same cigarettes that we smoke in Britain. Why, in one year of trade through Wu-chow, the value of such imported clothing jumped from a thousand pounds to eight times as much. So the Chinaman is taking to the white man's way, and one wonders how much the better and happier he will be for it in the end. He, too, is looking for knowledge and science; he wants his electricity and his mechanics, and, like all other people, he shall have them; and in due course the guns and battleships will follow, and riots, strikes, more revolutions, tremendous wars, and year-books which will tell him, the working Chinaman with an Insurance Act all for himself, what has been done every year, and how much greater China is. Perhaps it is China's duty to be modern, and we know that there are the utmost horrors and misery in the country, and that, in the old formula, 'something must be done;' but the world is clearly to lose a little of its picturesqueness, and what really will China gain? From China with the presentday annuals one could go on to many places and think curiously on many subjects, get stuff for

Talk of many things,
Of Shoes and Ships and Sealing Wax, of Cabbages
and Kings.

It is a mightily busy and intense sort of world, a very wonderful place as it is now. But were it better to live in the present, or to have lived in those rich colourful days when Elizabeth was queen, or to have followed the simpler existence of the man of Mizamar, assuming that by then he had become homo sapiens, and had left the ape behind him?

* * *

A philosopher of France gives an epilogue of flat contradiction to these thoughts, and as one goes forward in a new year, perhaps a little timidly, it is consoling in its influence. It is M. Jean Finot, who writes in La Revue, and he asks and answers that fine question, 'Are we happier than ever?' M. Finot embraces in his own temperament the first essential of happiness

in that he is an optimist, while most of us now are otherwise. He believes in man, he believes in the world, and he believes in the times. he has faith in, and even love for, the times. Truly he says that whatever shape our ideal in life may take, it always expresses itself in the form of an aspiration toward happiness, though it may appear in the garb either of divine self-denial or brutal egotism. He urges that the quest of happiness in its various forms is identical with the history of civilisation itself, and then he goes on to his supreme conclusion: 'The question whether we are happier really reduces itself at the very start to the question: Are we freer? The broader and intenser our life, the happier it The more it embraces all fields of activity, the more it shakes off the constraints which paralyse the free development of our souls, the closer it approximates to the happiness of which we dream. How inferior, then, was the existence of a man of the Middle Ages compared with a free citizen of our own time! One need but compare our own lives with those of our ancestors to appreciate our superiority. have open to us a source of happiness which was completely or partially unknown to them. Accustomed to light and liberty, it is difficult for us to understand the unhappiness which the fanaticism of the past provoked so often. In the eleventh century many good people perished by fire and sword because they dared profess an innocent admiration of Virgil, Juvenal, and Horace.' M. Finot goes on to say that with the gradual disappearance of superstitions which made life unbearable in the Middle Ages, and with the final triumph of freedom of thought and speech, real happiness has become more accessible to all. The importance of the individual is recognised to-day, and his realisation of happiness has few obstacles. And in addition to the development of individual liberty, there is also the inexhaustible supply of the emotions of love in the man of to-day, both of which faculties are the most significant modern assets of the happy life. Such words come bravely and well from a philosopher of a country that takes life more lightly and happily than any other, and if with an effort they can be believed, they are cheerful for the beginning of another year that separates us still farther from the farback simplicity of Mizamar.

A KNIGHT ON WHEELS.

CHAPTER IX. -- GENUS IRRITABILE.

MONTAGU FALCONER had had a busy day. At breakfast he had sent for, and sworn at, the cook. The cook, who was a lady of spirit, and accustomed to being sent for, had reserved her defence until the storm had spent itself, and then pointed out with admirable com-

posure and undeniable truth that an omelette which is uneatable at a quarter to ten may have been—and in fact was—in perfect condition when placed upon the table at nine. She then withdrew in good order, parrying the intimation that she might take a month's notice, which

hurtled through the door after her, with the rejoinder that she recognised no orders save those of her mistress.

When she had gone Mrs Falconer said calmly, 'I wouldn't give cook notice quite so often, old man, if I were you. Some day she will take it, you know, and then where will you be? Don't forget her marrow-bones; they are the best in London.'

In reply Montagu Falconer picked up the omelette between his finger and thumb and threw it into the fire, where it created an unpleasant smell.

After this promising beginning, he proceeded to his day's work. As he entered the studio he noticed a middle-aged woman pass the window, supporting one end of a basket, at the other end of which staggered a tumble-haired little girl. It was the laundress, with her daughter.

The daughter was not too well dressed. She wore a short and rather ragged frock, and had holes in her stockings. But she was a picturesque little figure, with a pretty face and wild coppery hair.

Mr Falconer had intended to devote a sulphurous morning to the completion of 'Strange Bedfellows.' This prospect possibly accounted for the omelette incident, for Peggy's papa possessed what is indulgently called a temperament; which, being interpreted, means a dislike (from which many of us less highly strung people also suffer) of performing uncongenial duties. But at the sight of the little girl his professional instincts despatched him hot-foot through the French window into the garden. Here, with much shouting and redundancy of words, he secured from the dazed but gratified parent, in return for an unnecessarily generous fee, the services of her daughter as model for a head-study.

'I'll run 'er 'ome an' wash 'er face, sir,' she announced, 'an' you shall 'ave 'er back in 'alf-an-hour.'

She was better than her word. The little girl returned in twenty-five minutes. Not only was her face washed, but she wore her Sunday frock, together with a pair of sixteen-button boots of patent leather—the patent upon which had palpably expired—once evidently the property of a lady of fashion, and a tragic travesty of a toque. Under her arm she bore her mother's umbrella; and her wild mane was screwed into two tight pigtails, fastened at the tips with bows of magenta ribbon.

Montagu Falconer, blaring like a bull, cast her forth weeping, to be intercepted and comforted with clandestine cake by Mrs Falconer at the back-door.

After this followed a savage onslaught, two hours in duration, upon 'Strange Bedfellows,' which infuriated its creator so much that at luncheon his wife was afforded a more than

usually numerous series of opportunities of 'making allowances.'

In the afternoon there was a slight lull, for Montagu betook himself and his temperament for an airing on the Heath. He returned, sheer drunk with the glories of an autumn sunset, to make a heavy and unwholesome tea. But in an evil moment he asked for his daughter, and it was discovered that she was not in the house. A hurricane sprang up in a moment, increasing to a typhoon when Miss Peggy arrived with a stained frock and a bruised knee.

She was despatched incontinently to bed, where cook and the housemaid and (later) her mother combined to tend her wounds and supply her with abundant, if surreptitious, refreshment.

After dinner Montagu Falconer found himself in possession of a fresh grievance. His wife had deserted him. As a rule she sat placidly upon the other side of the fire and listened while her husband derided the British Philistine and consigned the members of the Royal Academy seriatim to perdition. But to-night even these simple pleasures were denied him. His wife's chair stood empty. Probably she was upstairs, coddling that insubordinate brat Peggy. Her own husband, of course, might shift for himself; he had no claim upon her consideration. He was at liberty to slave day and night to keep a roof over their heads; but when, shattered by the magnitude of his exertions, he returned to his own fireside for a few words of wifely recognition and encouragement, what did he find? An empty chair!

He laughed bitterly.

'I wonder,' he said, 'how high I might not have climbed if I had been properly understood!'

He was so engrossed with this gratifying speculation that he failed to hear seven portentous thumps upon the floor of the passage leading to the studio.

After another half-hour his sense of grievance took a still more pathetic turn. He was now the willing, patient, overdriven bread-winner, struggling to keep an impoverished household together. His part was to work, work, work, with none to say him nay. Happy thought! He would go and work now. Possibly if his wife found him, half-blind with fatigue, toiling at his easel at midnight, she might feel sorry. Anyhow, he would try it.

Feeling comparatively cheerful, and ignoring the fact that one does not usually paint by artificial light, the down-trodden bread-winner proceeded to the studio. He stepped softly, for he did not want his wife to hear him at present. She was to discover him later, when his stage effects had been properly worked up.

To his surprise, he noted a light under the studio door. Who could it be? The servants were strictly forbidden to enter the sacred apartment at all. It seemed too much to hope that

it might be the cook. His eyes gleamed, and he turned the handle softly.

Philip was sitting upon the sofa on the modelthrone, partaking of chicken-and-ham and cocoa with an air of romantic enjoyment. He had now been an inmate of the studio for four hours, but Peggy had not returned to him. Instead, a kindly, cheerful lady, with eyes like her daughter's and a whimsical smile, bearing sustenance upon a tray, had paid him a lengthy visit. To her Philip had recounted the full tale of Uncle Joseph, not omitting the Beautiful Lady, but suppressing the nature of Uncle Joseph's profession and his own part therein. This was unfortunate, for had he not done so Mrs Falconer would have pointed out to him what he had so far failed to realise -namely, that as the Beautiful Lady had walked in at the door Uncle Joseph's old life had flown out of the window, and that Aubrey Buck, Tommy Smith, et hoc genus omne were no more.

'I will think things over in the night watches,' said Mrs Falconer, 'and in the morning I will come and tell you what to do. Now, you queer little mortal, eat up your supper and go to sleep. As you have no mother, do you think I might give you one kiss?'

That was half-an-hour ago.

Philip was conscious of a slight draught upon the back of his neck, which was turned toward the door. Hardly had he realised this than he was aware of an inarticulate roar; and into his field of vision there bounded a gentleman with a golden beard and a fiery eye, wearing a black velvet dinner-jacket. This was doubtless Pegs' father, and from external evidence he was suffering from one of his 'tempers.'

What the Blazing Henry are you doing here?

bawled the gentleman.

Philip replied politely that he was having

Supper!' yelled Montagu Falconer. 'How dare you have supper in my studio? How dare you bring your filthy food in here? Tell me that!' His eye fell upon the tray, suggesting a fresh outrage. 'Where did that supper come from?' he demanded. 'Where from, you mooncalf?

'It came along that passage,' replied the mooncalf, taking a drink of cocoa.

Peggy's papa waved his arms and raved.
'Curse you!' he shouted. 'Don't drink cocoa in my presence! It is a beastly habit and a beastly beverage. It's my cocoa, too!'

'It was getting cold,' explained Philip in

extenuation.

'And don't answer back!' bellowed the master of the house. 'Don't answer back, or I'll brain

you—like—like this!

He snatched a medieval mace from off the wall, and, to Philip's intense gratification, proceeded to pound an Etruscan vase into smithereens.

'Who are you?' he continued. 'Who are you, to go filibustering all over my house? Who are you, to insinuate your disgusting presence into my kitchen and forage among my household stores?'

Philip, still keeping a hopeful eye on the medieval mace, considered. 'I'm a boy,' he said cautiously.

This eminently reasonable explanation only

exasperated Mr Falconer still further.

'No, you are not /' he bawled. 'You are a criminal! Do you know I have a wife and daughter-let alone a staff of young and innocent servants? Supposing one of them had seen you? You might have frightened them all out of their wits, you toad!'

Mr Falconer stamped up and down the room, plainly meditating further enterprises with the mace. Philip, realising that his host had not yet been taken into the confidence of his wife and daughter regarding the present situation, decided to be cautious.

Presently the fermenting Montagu came to a 'Why did you come here at all?' he standstill. demanded.

'I wanted somewhere to sleep,' replied Philip. Montagu uplifted clenched hands to heaven. 'Unutterable dolt!' he roared. 'Do you imagine this is a casual ward?'

'Oh no, sir,' Philip assured him. 'I like your pictures awfully,' he added, with a friendly smile.

This time Montagu Falconer first gaped at him, and then inquired, 'Are you a cretin?'

Philip, who did not know what a cretin was, shook his head dubiously, and said he was not

Mr Falconer, after assuring him that there was no doubt on the matter whatever, con-'Where tinued his cross-examination. devil have you come from? I suppose you know that!

'I came from Hampstead,' replied Philip.

'Do you live in that beastly spot?'

'Yes.

'What for?'

'You have to live somewhere,' the cretin

pointed out gently.

'Then why not go on living there, you unspeakable Yahoo? Why leave your antimacassars, and china dogs, and wool mats, and wax fruit, and—and harmoniums, and come bursting into a civilised household-eh?'

'I have run away from home,' said Philip

simply.

Mr Falconer uttered a yell of triumph. 'A-a-ah! Now we are getting at the facts. What is your address?'

Philip told him.

Mr Falconer assumed an air of ferocious satisfaction. 'Admirable!' he cried. 'Most inexpressibly satisfactory! You are outwitted! I have overreached you-criminal! To-night.

since you desire it, you shall enjoy my hospitality; but to-morrow morning, on the stroke of nine, an officer of the law—a policeman—shall wait upon you and conduct you back to the slum from which you came. Meanwhile, wretched offal, sleep! Sleep all over the studio if you like, and be damned to you! To-morrow—ad leones! Good-night!

And without another word this excellent but ill-balanced householder shot out of the studio into the passage, locking the door behind him

Philip finished the last piece of ham and the last mouthful of cocoa, turned out the electric light, rolled himself up in a Greek robe of saffron serge, and lay down upon the sofa. He was concerned in his mind about several things. In the first place, he had been discovered, and that

might mean trouble both for Peggy and her mother. In the second, the door was locked, which meant that he was a prisoner. In the third, he was to be sent back to Uncle Joseph at nine o'clock next morning, which would be an ignominious ending to his first great adventure. He pondered.

In due course, just before he fell asleep, his obvious and proper course of action occurred to him. It was the only way, he decided, and, moreover, promised further adventure. He would have liked to be able to say good-bye to Peggy;

His eyes closed, and he slipped into the dreamless, motionless sleep of tired childhood, the lay figure and the other 'Strange Bedfellows' keeping watch and ward by his pillow.

MEMORIES OF THE FALKLAND ISLES.

By the Rev. A. MACKINTOSH.

SHORT but interesting article by Mr Buchanan in the February part of Chambers's Journal for 1913 suggested to me the idea of supplementing what he wrote about these islands of peat, rock, and wild birds. Dr Johnson somewhere described them as barren and tempest-beaten desolation; Darwin had nothing complimentary to record of them in his Voyage of the 'Beagle;' and Mr Buchanan directs attention to the dull, leaden sky, the gloomy and depressing There is no denying these islands have a bad reputation—they once formed a penal settlement; and yet I spent many pleasant days in the Falklands. There the sky was as clear, the sun as bright, the air as exhilarating as I have experienced in our own country on a glorious summer day. Nay, I found the summer less sultry and depressing than our average July summer. The reason of this may be found in the amount of salt in the atmosphere, detrimental though it be to the growth of anything in the shape of a tree. For five years I never cast eyes on a tree, a cart, a road, a field, a hedge, a stone house, or a horseshoe, and this in a land of wild horses!

Although the Falklands are geographically put down at two hundred, to the Falkland Islander there are only two Falklands—East and West. My acquaintance with the former was limited to Port Stanley, the seat of government; and in this case my knowledge did not extend much beyond the jetty, against the end of which leant, like old pensioners, three creaking old hulks that would never sail the seas again. Our imaginations conjured up many an impossible deed of piracy as we explored the mysterious compartments strongly smelling of tarry rope.

In the West Falklands, the centre of business and port of call is Port Howard, on the southern side of the island. To the north-east lie the ranches-Ponds, White Rock, Mount Rosalie, Lee, and Bulger-all large sheep-runs consisting of mountain, hill, and valley. A day's journey on horseback would fail to furnish a view of a plain even half a mile in area. What level land there was provided poor feeding, as the grass was scrubby and hard, owing to the stony nature of the subsoil; but it was good ground for horse-racing of a primitive kind. On the hills the grass was abundant, in some cases rank. On the mountains rocks and stones held glorious sway. Some were angular, some pointed like the fragments of a basted iceberg; none were rounded -a veritable cataract of jagged boulders stretching from the base to the summit of a mountain two thousand feet high. The pioneer ranchers had cleared a pathway through this gray, stony channel extending in some cases three hundred feet. Otherwise it was unsafe for man and impossible for beast to attempt to cross owing to the crevices between boulder and boulder. I refer to the Mount Rosalie specimen. In this case I knew of a man who owed the safety of his skin to this peculiar convulsion of nature. He had come upon a wild cow and her calf. Leaving his horse on one side of the channel, he made his way across to the danger zone. The mother gave chase, and he beat a hasty retreat, finding safety five feet within the stream of boulders, at the edge of which halted the irate and helpless dame.

There are no trees in these islands; consequently the country presents a bleak appearance. In the autumn the long grass, turning somewhat grayish, imparts a disagreeable and monotonous aspect to the hillside. On the return of spring the ranchers had a glorious time of it in literally setting the camp on fire. This was done by

simply striking a match on the saddle-pommel and casting it into the midst of the withered grass. No coaxing was needed, as the material was withered and dry as tinder. Presently the mountain-side would be fringed with one long line of raging flames and curling smoke. Thus was the pasture renewed.

Although no trees grow in these islands, there is ample evidence of the land having once been thickly wooded, especially on the northern side of the West Falklands—the side sheltered from the cold gales that blow from the Antarctic. Here the land is almost entirely peat, in some places so boggy that it is unsafe for horses to attempt anything in the nature of a mild trot. I have seen heavy horses sink to the girths. In many cases there was a subsidence of surface that left regularly defined terraces of peat four or five feet high. Similar terraces on a smaller scale may be seen on the Moor of Rannoch.

In the valleys grew scrubby bushes, hard and flowerless, of the colour of southernwood. the burns trout were plentiful but diminutive. The creeks were simply swarming with mullet. Where the shore was thickly bedded with large and protecting stones was to be found a peculiar fish somewhat like a goldfish. It was the belief that it was impossible to kill this fish, so it was fried alive. The method was cruel, but the result was delicious.

Wild birds were plentiful and various. There was a species of redbreast that would put even the British type to shame. It was as large as our blackbird, and as black, with the exception of the breast, which was blood-red. With apologies to its memory do I condescend to call our British specimen a redbreast. There was a species of swan, entirely white with the exception of the neck, which was jet-black; it was a periodical visitor, and whence it and its companions came or where they went no one knew. Teal ducks were plentiful, and provided excellent winter sport.

The characteristic bird of the Falklands nowadays seems to be the wild goose. There is a premium on the destruction of the rapidly multiplying geese. In the eighties the premium was upon the destruction of the high-flying condor, which would now and again sail down and settle on the head of a sheep and eat its eyes The premium was sixpence per beak. In those days the geese were numerous. In summer-time they fed on a peculiar white berry about the size of a red current, which had a tincture of pink, and grew on peaty ground, and made very delectable jelly. Strange to narrate, the writer once discovered a solitary strawberry on a sandy plateau beside the sea. Its seed had been carried thither, no doubt, by some passing bird.

I suspect that nowadays there is not to be found in the Falklands what entranced my youthful enthusiasm—wild cattle and wild horses. The cattle were killed, the carcasses put through a fiery process, the fat extracted and shipped to London along with the hides. The method of destruction was not so prosaic as that adopted in the slaughter-house. It was more romantic, though more cruel. A bunch of cattle was selected, and then it was a case of catch who can. Capture was effected by means of the The bolas was often brought into lasso. requisition. This was made of three thongs of bull-hide, two ends of which were weighted with a round stone as large as a goose's egg. The third thong was weighted with a smaller stone, and was held in the hand as the bolas was swung round overhead. Thrown by a cowboy in full gallop, the bolas was a fatal instrument of entanglement, encircling the hindlegs, shackling the animal, and in some cases cracking the bone. Then the lasso was thrown, the twelve-foot loop gradually lessening as it fell gracefully over the head, when it suddenly tightened round the neck of the victim. The horse, well trained, veered to right angles and leant sideways to meet the exciting shock. It was now a tug of war, as neither beast would yield. The cowboy would dismount, make a circuitous tour to the rear of the captive, cut the hamstring, and with the agility and dexterity of a fencing-master plunge the long-bladed knife into the windpipe. Thus was the deed done in the camp; where a corral or pen was at hand the work of despatch was not so exciting. In this case it was merely a matter of riding into the corral, lassoing a beast, and dragging it prostrate through the mud into the open, where it was tame business to give it the finishing-stroke.

In regard to the wild horses, they were brokenin. It took three days to lasso the last mare. She was entrapped on the point of a peninsula. On one side were the cowboys, and on the other the waters of the Southern Atlantic. The sire himself was reduced to the indignity of bearing on his massive back the puny form of a boy of fifteen. Once he asserted himself, shot the monkey-weight bolt-upright into the air, and indulged in the luxury of a mad gallop, ending in a bog. Strange to say, he came back and tamely submitted to be reburthened with the

discarded goods.

Presumably the wild cattle and wild horses have disappeared, but the penguin is still there, as he has been from time immemorial. There was a penguin rookery at Tamar Pass on the Ponds ranch. The first settlers had chosen an ideally perfect spot so far as the requirements of a penguin are concerned. There was about an acre and a half of plateau on the edge of swirling waters. It had once been a plateau of waving tussock, a growth not unlike the gladiolus in colour, shape, and size, and tasting somewhat like celery, as succulent, but sweeter. Here the ancient penguins had established themselves. The tussock had decayed, root and leaf, and in its decomposed state it provided tufted forma-

tions admirably suited for nests. Dry as cork. brown as leather, and soft as moss, it presented a peculiar appearance once the colony retired to the waters. Then was witnessed a sight seen only in those regions where man is seldom met. Here was a plateau with three thousand nests and nine thousand eggs! It was computed that this rookery had three thousand penguins. Each penguin lays three eggs, larger than a billiard-ball, and nearly as round; they taste fishy, the shell is very hard, the 'eating' very strong. Iky Lee, our champion cowboy, ate four at one sitting, and he did not die! The swallow is flighty, the eagle sublime, and various other birds share among them certain common characteristics; but there is nothing in nature like the stolidity, indifference, and contempt exhibited by the penguin. It seems absolutely devoid of anything akin to emotion. Its short wings tightly glued to its side, it stands erect as a drum-major. Rob the nest, and it will not betray the slightest interest. Stroke its head, and the only indication of vitality it condescends to show is in the blinking of its eyes. Its dignity of bearing forbids the stigmatising of this passivity as stupidity. In another connection, also, it is most inappropriate to class the penguin among the stupid birds, for when the penguins have decided to leave the rookery it is remarkable that there is nothing

like a stampede among them. Those nesting nearest the waters retire first, and retire more or less in rank; those nesting on the landward side instinctively await their turn, and in less than half-an-hour not a bird is to be seen in the rookery. They have a king-penguin. His majesty goes the round of the rookeries. During five years he paid one periodic visit to Tamar Pagg. Where he came from, why he came, and whither he was going next no one knew. Before his arrival word had gone round the various ranches that he was in the vicinity, and so we set out one day to pay our respects. He had come. When we approached he was standing on the landward side of the rookery as if guarding the frontier. He stood about three feet high, and wore a mantle of deep blue over his back; his breast was yellow; his eyes had a shade of vermilion. Like a true penguin, he was dignity personified. He betrayed more than penguin emotion, for majesty and indignation were blended in his expression of wonder and resent-ment at the intrusion. Probably he had never cast eyes on human beings before, and it was difficult to say who were the more ill at easethe king or the spectators. We stroked his head. He ignored the familiarity. He stood his ground, and moved not an inch till all the members of his seraglio had decamped.

THE WASHER AT THE FORD.

By HELEN PORTER.

SOME houses have atmospheres of their own, and The Priory was one of them. It was very old, for one thing, and romance and mystery lurked in its narrow passages and quaint octagonal rooms.

Diana Morton, who had arrived that afternoon, on her own invitation, felt its peculiar atmosphere at once; but it was evening before she spoke of it. 'I never knew your house was so beautiful, Cousin Jane. It is not the least like any place else. I suppose it is the bend of the river, with the arched bridge below and the great ruined castle on the opposite bank. There are surely countless ghosts too; it feels haunted.'

The elder woman smiled at her. 'When one grows old, child, every place is haunted. Sometimes it is the ghost of happy memories that comes to meet us, and sometimes only spectres of gray regret or phantoms of "what might have been." There was a quiver in her voice, and the young girl looked up quickly.

The dark curtains were drawn, and Miss Anstruther was sewing placidly. The lamp, with its green parchment shade, flung a ring of light where she sat, leaving the rest of the room in shadow.

Suddenly the girl dropped on one knee beside her cousin, taking the delicate lace-work out of her hand. 'Cousin Jane, I wonder if you can help me? I am miserable, because I cannot make up my mind.'

'Your mother wrote to me that you had a love-affair. My dear, I do not wish to ask any questions; but, if you would like to tell me, I am said to be a good listener. You say you cannot make up your mind. Is there any hurry about it? Why not wait a little?'

'I don't know why I want to talk about it. There is something about you, Cousin Jane, which makes me wish to speak. I suppose it is because no one at home seems to understand, and I feel that you do understand. I cannot wait, because, you see, the regiment goes to India in about a week.'

'He is a soldier, then?'

'One of them is—the one I do not intend to marry. He is poor, Cousin Jane, wretchedly poor, and we should have to wait for years and years perhaps.'

'And you love him?' Miss Anstruther asked

gently

'I am not sure. Sometimes I am afraid that I do. One thing is certain, and that is that I like him ever so much better than the other, the one my parents would like me to accept. Have you heard about him?'

'He is very rich, isn't he?'

'Yes, he has mints of money. It means motors, jewels, fine clothes, and amusements, all the things I love; a house in London, a box at the opera, foreign travel, just everything I have longed for and have never had. We are so miserably poor! You don't know what it is to be the eldest of four daughters, all grown up and wanting to go about and have a good time. Then I am not very young. I was seven-and-twenty my last birthday, and a good chance like this is not likely to occur again.'

'I see that. So you are trying to be sensible and worldly wise, and letting romance go its own way, sending it out of your life for ever. Some people can do that quite comfortably, and live happy ever after; only, be sure that you are one of that sort, dear child. Have you refused

this young man—the soldier, I mean?'

'I told him I could not be engaged to him, but he still hopes I may change my mind. I could not face a long, hopeless engagement,' the girl said passionately. 'He does not know about the other man. That is the hardship. I can let Dick go; but I do not want to marry any one else, only I must. My people expect it. It is the natural end of every well-brought-up girl; and, candidly, I'd simply hate to be an old maid. I beg your pardon, Cousin Jane. I did not mean to be rude. I ought not to have said it in quite that way.'

Miss Anstruther laughed. 'There is no harm done in calling a spade a spade. If I were sensitive about that I'd have married long ago. You see, I could have done so had I wished. I

had even a choice like you, my dear.'

'If only I could make up my mind!' said the girl slowly. 'If only some one would decide for me, I think I could learn to be contented and happy. It is the uncertainty which makes me wretched. Once Dick is gone I may feel differently. I suppose it can only end one way; since I can never marry him, I may as well do the best I can for myself. After all, I'll get something certain—money, position, and a dip into all the flesh-pots of Egypt.'

Miss Anstruther laid her hand softly on the bright head at her knee. 'I believe you have already decided, dear, and that you will accept this rich man. I think in your heart you are sure of it. I cannot influence you. It is too serious a matter for any outsider to dare to interfere. I can only tell you an old story. It is a very old one now, and nearly forgotten by every one except myself. It fits in with what we were discussing this afternoon. Pull the blinds, Diana, and tell me if there is a moon to-night. Open the windows wide, for the room is hot and stifling.'

Diana rose and did as she was bid.

The moon was sailing clear and crescent-shaped overhead, and the river reflected it on its rippling waters. Myriads of tiny wings were beating

the still air. Pale night-moths fluttered under the bushes, while in the grass beetles clicked with metallic sound. A bat flew past with a frightened squeak. Everywhere rose a slumberous murmur and hum, for the dew was falling fast, and all the creatures of the dusk awoke to greet it.

Then Miss Anstruther began her story.

'Very, very long ago, Diana, before the bridge was built, the river was crossed by steppingstones. Ath Truim it was called (the ford of the bourtrees or elders). You have heard some of the superstitions about these fords or crossingplaces?'

The girl was seated on the floor, leaning one shoulder against her cousin's knee, so that she could not see the lady's face, and she answered, 'No, Cousin Jane; I am very ignorant, I fear. She was just a trifle disappointed. She had thought that Cousin Jane intended telling her own story, or at least something personal, warm, living; but it seemed they were back to dim legends from the shadowy past. What had all these dead-and-gone things to do with the present? She even lost the thread of what was being said as her mind flew off to her own troubles. She had not merely her own selfish inclinations to consider; there were others to remember-her parents, her sisters, even Dick himself, for a poor marriage might ruin his career. Then, with an effort, Diana concentrated her wandering attention.

'My old nurse made me familiar with the tradition of the Washer at the Ford,' Miss Anstruther continued. 'Let me see; I think I can repeat a description of her. It goes thus:

With gray, dishevelled hair Blood-draggled, and with sharp-boned arms and fingers crooked and spare,

Dabbling and washing in the ford, where mid-leg deep she stood Beside a heap of heads and limbs that swam in

eside a heap of heads and li oozing blood.

Sometimes it was a shroud that she washed and wrung out in the clear water. On the eve of battle she appeared, a ghastly warning of death, for no one who saw her ever returned.' Miss Anstruther paused and shivered.

'It is a sickening legend, Cousin Jane; but why talk of it now? Surely that was not the

story you meant to tell me?'

'Listen, dear, till it is ended. Down the river, below the last bend, stands an old house buried in trees. It belongs to the Lacys, some of the family who used to own the old castle opposite. They were Norman settlers, but intermarried with the Celtic race. That is why Richard de Lacy, riding at the head of his menatarms, saw the Gray Washerwoman. He did not turn back, but was killed in battle. Ever since then, when a Lacy is in mortal danger it is said she appears in warning.'

'Cousin Jane,' broke in the girl a little breath-

lessly, 'I meant to tell you before. His name is Richard Lacy, and he lives somewhere near here, or at least his people do. I came to visit you because I wanted to say good-bye to him, whether I marry him or not. I was to meet him to-morrow. I am sorry now, for I ought to have told the truth about it, only I was afraid of what you would think. But of course you guessed? You would not have talked like this unless you had known. I only wish he had some of the money his ancestors wasted—not much, just enough to buy happiness,' she ended with a sob.

Miss Anstruther shook her head as she answered very slowly, 'No, dear, I never heard any name; it is a strange coincidence, that is

all.

Diana turned to look at her, startled at the tone of her voice. She was very pale, and shaded her eyes with one thin hand as she went on: 'They say that history repeats itself. I hope in this case that it may not be true. There was another Richard Lacy, but he died years and years ago.'

There was something in Miss Anstruther's manner that touched the girl inexpressibly.

Diana laid a timid hand on the elder woman. 'You loved him?' she asked softly.

'Shall I go on, dear, or have you had enough of my story?' inquired Miss Anstruther.

'Go on; please go on.'

'I was a pretty girl, Diana, or at least they told me so. Have you ever heard that I was nearly making a great match, but threw it all

up on my wedding morning!'

'Yes, now I remember, father said something about it. He said no one could understand it; that you had a bad dream or a vision, and so ruined all your prospects. He said that you were very ill for a long time after, and the marriage engagement broken off was never renewed. He did not know whose fault it was.'

'I have not talked much of it, for many reasons. For one thing, few would believe the strange tale I have to tell. My parents were bitterly disappointed at the time. Ah, well, they are dead and gone too, and I am left quite alone now. Our conversation this evening brought it all back to me so vividly, and once more I seemed to be a girl, a calm, sensible girl, weighing all the arguments, forgetting that Fate alone disposes of our lives. Everything you thought and said I once thought and said too. Why wait for a man who could not marry me? Why waste life crying over spilt milk? And the irony of it all is this: I have waited all my life, am still waiting in loneliness till the day I keep tryst with him in heaven. I sent him away, Diana. I did not care enough, or rather I cared more for other things. My eyes were dazzled with the mere jewellery of life, with its tinsel.' She laid her hand on Diana's shoulder. 'He was a very great match for me, my dear, and I was vain, and thoughtless, and flattered—oh, so flattered!—that he should chose me. I had no illusions. I cared little for him apart from the proud place he held in the world. The poor mean thing I called my heart was all Richard's. It was the eve of my marriage. I was tired and over-excited, and when at last I went to bed I The room is above this, and could not sleep. looks down over the river, which was in flood that night, and the roar and fret of the water got on my nerves. I got up presently and lit the candles in the brass sconces against the wall. I wanted light, plenty of light, and the room was bathed in it. My wedding-dress gleamed and shone as the bright light fell on the delicate satin and lace, and touched the pearls. There was my veil, with its wreath, lying on the bureau, ready to wear next day.' She sighed.
'Well, to continue. I opened my Prayer-Book,

'Well, to continue. I opened my Prayer-Book, and began studying the service; but it in no way calmed me, it seemed so solemn and dreary to one

who wanted only to be happy and gay.

'Thin shafts of light were filtering coldly through the cracks in the shutters. The wind had risen, and was wailing round the house like a forlorn spirit. Dashes of rain on the panes and loud rumblings in the chimney told me that there was a storm. I rose and drew the curtains. Then I blew out the lights, and even now I seem to smell the faint odour of wax, as I was left nearly in darkness. It was a very desolate dawn, cold and drab, with sheets of gray mist curling wraith-like off the fields; while the bed of the river lay in a thick fog. The horizon was touched with a bar of lurid green, and the trees loomed through the semi-gloom like ghosts, tossing their bare branches before the fury of the wind.

'Then I saw her—saw her distinctly; though afterwards they said I was dreaming, that the whole thing was a hallucination, a figment of an excited imagination not yet fully awake. But I have no doubt that with my waking eyes I saw her, a dread, gaunt figure wringing out a shroud. She was stooping over the ford, her thin, grizzled hair streaming behind her, and her scraggy arms beating up and down. Through the fog I could discern her sharp, pinched face, with purple lips exposing teeth like tusks. Then she was gone.

'I staggered as I hastily threw on some clothes, and hurried out. One thought, and one only, possessed me. Richard was dead. In a flash my eyes were open, and I knew the truth. I loved him, and nothing else mattered at all. There would be no wedding that day, but a

funeral.

'I reached the house in the trees, and my friends were terrified at my pale face, and thought me distraught. I was no welcome guest of late, for they thought that I had treated their son badly. Even as I spoke with them the telegram came. He had been killed in a native rising.

'I cannot speak of it calmly after thirty years, Diana. I never married, as you know. I do not know why I have raked up the past now,

except as a warning, for I do not wish to influence you in any way. Only make sure you know your own mind before it is too late. Money is a good thing; so is pleasure; but take care you do not pay too high a price for them in throwing away love. Dear child, there is a great, deep ford we must all cross at last; between its banks the river runs dark and wide, and the shrouded figure we call Death washes away all the dross we hold so closely here. Only on the verge stands Love, and only Love can cross that ford and meet us on the other side. Weeping, Diana? Not for me, surely? I am quite contented and happy in my humdrum life, because I have learned to do without many of the things that in my youth seemed desirable. I am rather lonely at times, and sometimes sad; but I would not have it otherwise.

'I wish I knew what to do! I wish I knew! I want to do what is right; but life is very hard and puzzling.'

'Do not be in such haste. Leave something to Fate; for we may think, and say, and do what we will; but it is Fate that decides for us.'

Diana did not sleep well; she was troubled about her own affairs; and when at last she fell into a doze, it was to dream of the story her cousin had told her. Of course it was all a mere coincidence, she told herself in one of her waking moments; but it all fitted in so well, and was so poignant, so moving in its mixture of truth and legend, she could not get it out of her mind. Was it always so? Were these conflicts between love and inclination the common lot of all women? With a smile she found herself wishing that she had lived in the Middle Ages, when men chose their wives at the point of the sword, and when no choice for the woman was possible.

It was six o'clock when finally she awoke, and got up to lift the blind. Then she gave a great start. Just above the bridge she could see a kneeling figure wringing out a white sheet.

Her nerves were all unstrung with the tale of the night before, and for a moment her heart beat heavily. She rubbed her eyes. was a woman, no dread phantom of the imagina-Yet, all the same, she would go and see for herself. It would be an intolerable thing to feel all day that she had perhaps received a warning. Besides, Dick was going abroad, and possibly into danger. At the thought she paled. She might never see him again, and the goodbye to be spoken that afternoon might be for ever. It was an exquisite morning; the air was full of freshness, and the birds singing gaily. Over the grass the silver gossamer lay like a glittering carpet, and every flower held a dewdrop in its heart.

Standing on the edge of the river, Diana watched the girl at work. She was quite young, with a mass of yellow hair, on which the sunlight

glinted. She was not the least like a withered old crone, but full of life and energy, as she washed and lathered and rinsed in the bright

'You are very busy.'

"Deed an' I am that, miss." Her cherry lips parted in a friendly smile.

'And surely very early at work?'
'Tis the day of the pattern, an' I had a lot to get through, for the missus is givin' me a holiday.'

'What is your name? Do you live in the town?'

The girl nodded. 'Delia Mahony till I be thinkin' o' changin' it!'

'So you are going to be married?' Diana asked, feeling very much interested, and thinking what a queer turn the conversation had taken; but then the river-bank at dawn was not the place for ceremony.

'So Denis says,' the girl replied, blushing.

'But I'll have a long time to wait.'

'So there is a Denis? What is he—a farmer?' 'Troth, then, an' I wish he was that-a farmer. No, miss; 'tis a soldier he is-worse luck; for there is no chance of my gettin' on the strength of the regiment for ages an' ages.'

'A soldier! In what regiment?' was Diana's

eager question.

'In the One Hundred and Seventh, miss; maybe you know it. It is goin' to India in ten days,' the girl answered, her face clouding.

'Yes, I know it. Suddenly the girl stopped her work and raised wistful eyes to her questioner. 'They all tell me he'll forget me, miss; that it is the big fool I am to be waitin' for him, an' ould Nick o' Ballyduff is sweet on me, an' has promised me a jennet an' a side-car. But there, I can't bear the sight o' him. I'd better trust to Denis. I think I'll chance it.'

Diana started. It was her own problem all over again, only in a slightly different setting.

Then, as she did not reply, the girl glanced at her shyly, twisting a corner of her apron. 'What would you be thinkin', miss?'

Diana hesitated; then she smiled. 'I think I'll chance it,' she said, and a great weight seemed lifted from her heart. 'I am staying at the old house, Delia. Will you come and see me some day? I know some of the officers of the regiment, and might perhaps put in a good word for Denis.'

'Thank you kindly, miss.' She coloured with pleasure, and resumed her task, singing as she flapped the linen on the stones at the foot of the bridge.

There was no use going home to a sleeping household, and Diana did not know what to do. As she passed through the village every door was shut, and no smoke rose from the chimneys. In the distance a cock was crowing shrilly. course it is very hard to be poor,' she said aloud;

'but then I've never been anything else, and I feel so very, very happy.' She turned and hurried along the road, her eyes fixed on the ruined castle; and before she knew she had collided with a young man. 'Dick! Why, whatever are you doing here at this hour?'

'Now, what do you think?' he said, smiling. 'Well, I suppose you thought to see me; but you could not know I'd be out so early.'

'Unless, like myself, you could not sleep. you going to be kind to me, Di?' he asked 'I am finding the suspense very earnestly. hard to bear, and I hear there is another man, too.'

'No, Dick, there is no other man.' raised her serious eyes to his, and suddenly he began to hope. 'If I should say, "Yes"—if—if I say—— No, you need not come any nearer. 'If I promise to wait all the best years of my life for you, when you come home to find me old and withered and gray will you still care for me, or will you forget me out in India?'

'Why, Di, my dearest, don't you know I won't forget you?'

The vibration in his voice, the way he looked at her, dispelled her last doubt. Shyly she laid both hands in his. 'Very well, then, I think I'll chance it, Dick!'

'I have brought Dick to breakfast, Cousin Jane. I told him he would be welcome.'

Miss Anstruther rose hurriedly. 'My dear, how you startled me! I am astounded! You made up your mind very quickly, Diana,' she said, looking from the one to the other.

'Yes; we are engaged. I am going to wait for him; but it may not be so long after all. Two of the officers are retiring. It means promotion.

-Will you explain, Dick?' and Diana turned to the young man.

'It is this way, Miss Anstruther. Cooper has inherited a property and is leaving us, and Davis has married an impossible wife, and has got a hint to go; so my majority is well in sight, and we think we might marry when I get it.

'And I'm going to stay here with you quite a lot while he is away, Cousin Jane—that is, if you will have me. I am sure I am thankful I came. I nearly threw away my happiness; for I had made up my mind to accept Mr Brooks. I am no longer afraid of being poor. I don't want the tinsel trimmings since I have got the real gold.' She flung her arms round her cousin. 'And I love you dearly, Cousin Jane, and I just love your dear, old-fashioned house.

'I am glad you like it, dear, because one day it will be yours,' said Miss Anstruther. 'No, you need not try to thank me; and she held up an arresting hand. 'It came into my mind as you two entered that door together—my cousin and his nephew. There are no others I should prefer to succeed me here.' Her tears fell as she ended, and she stepped out of the window, leaving the lovers alone. It was beautiful out of doors, very beautiful and peaceful. She looked up and down the river, which glittered with rainbow tints through the mist which obscured her sight. Two tomtits were flitting in and out of an appletree with a flash of blue. She passed her hand over her eyes.

In the distant village a bell was tolling, for some one had died the night before.

Then Miss Anstruther smiled. She was thinking of the Gray Washer at the Ford, and of the glory of the 'far side' which lay beyond the dark river.

THE MONTH: SCIENCE AND ARTS.

THE 'NITRO' ELECTRIC LAMP.

THE perfecting of the metallic filament incandescent electric lamp constituted one of the greatest of recent achievements in electrical discoveries. By its aid the cost of electric lighting was reduced, while the illuminating efficiency was increased to about four times that of the carbon lamp, at nearly one-half the cost. The remarkable success of the 'met-fil' lamp, as it is termed colloquially, served to stimulate research and investigation in electric lighting, the object being to popularise this source of illumination in the household. But one or two peculiar problems remained to be solved. One of these was the prevention of bulb-blackening, and the research involved complicated and exhaustive experiments, so that considerable time elapsed before the cause of the blackening was discovered; but finally it was ascertained that

blackening is the result of generation of watery vapour, which, acting upon the metallic filament, produces a volatile oxide and atomic hydrogen. The latter reduces the oxide to a black metallic deposit, which releases the oxygen to combine with the hydrogen, thereby increasing the vapour attacking the filament—even an infinitesimal quantity of the watery vapour being sufficientand setting up a continuous chemical action. Accordingly the investigators set to work to eliminate this watery vapour, and in so doing charged the bulb with various gases instead of converting it into a vacuum. But the introduction of gases caused another trouble—a cooling effect upon the filament—and enhanced the running cost, thus rendering the lamp commercially impracticable. Among the many gases used in the experiments, the inert nitrogen gas gave the most promising results, and consequently the investigations were continued with this gas.

Strange to say, it was found that the ordinary hair-like filament was quite useless, being too thin; but by increasing the thickness of the filament tenfold the running cost of the lamp was brought down by over 60 per cent., to a figure approaching that of the ordinary 'met-fil' lamp; and thus by changing the form of the filament the cost of lighting was reduced to less than that of the 'met-fil.' At present the nitrogencharged metallic filament lamp can only be made in large sizes and high powers suited to exterior illumination, from fifteen hundred to two thousand candle-power, and some time must necessarily elapse before the 'nitro' lamp can be adapted for domestic use. The light produced by the 'nitro' lamp is whiter than that of the ordinary lamp, and may be most aptly described as artificial daylight; it is also intensely brilliant, and probably before its introduction into the household means of toning it down will have to be devised. It will then commend itself to the householder, because the cost of electric lighting is reduced a further 50 per cent. as compared with the 'metfil' lamp.

IMPROVED TOOTHED GEAR.

It is a somewhat remarkable circumstance that the method of making gear-wheels had practically undergone no development since toothed wheels were first contrived until recently, when a new type of gear was perfected by an English inventor. This is described as a laminated gear, being built up of thin sheets or plates of steel. The plates are not superimposed to the desired thickness, secured, and the teeth then cut by a milling cutter, as is the usual practice; but the teeth on each plate are notched out, the blanks being punched complete-including teeth, holes for the rivets, and shaft, as well as the key-way or spline for attachment to the shaft-in one operation. By this method all the discs meshing together are exactly alike. The discs so notched are assembled in a special manner. Each alternate superimposed plate is set half a tooth in advance of its neighbour on each side, so that in reality the wheel comprises a kind of double gear-wheel, the virtual pitch being halved and the number of contacts doubled. Any description of metal may be used for the plates, while any required pitch or shape of tooth can be obtained. In assembling the plates a washer is introduced between adjoining discs so as to enable the teeth to pass without friction. In this manner a wheel of any desired thickness can be obtained. The method of manufacture is simple and economical, the tools required for the purpose being cheaper than those necessary in cutting from the solid. The advantages of these laminated gear-wheels are numerous; they are as silent in running as is raw-hide, their construction renders them free from resonance, while their reliability is greater than those cut from the solid, inasmuch as the

breakage of a tooth does not throw the wheel out of service, since it can affect only one plate.

A SMOKE-CONSUMING HOUSEHOLD STOVE.

While industrial concerns are guilty of contributing materially to the pollution of the atmosphere, it is the ordinary household grate which is the worst offender. Recently a notable contribution toward smoke abatement has been made. It is the outcome of some thirty years' experience of the inventor with the economical combustion of bituminous coal, and is based on the utilisation of well-known natural laws affecting combustion. To secure perfect combustion two factors are essential. In the first place, there must be an intimate mixture and contact of the particles composing the combustible and the air, instead of mere access of an unlimited supply of the latter; secondly, the most suitable temperature for the chemical combinations involved during the whole period of combustion must be maintained. It is only under these conditions that the most effective results are obtained from the fuel; and there is an absence of smoke. The inventor has devoted years to the perfection of his system. The stove he has devised so far is arranged as an ordinary kitchen-range. fireplace is formed by hollow bars with double air-inlets connected to a hot-air chamber. The sides and back are hollow castings, also connected to the hot-air chamber. Air admitted from the front becomes highly heated in its passage to the top, where it is deflected by suitable fittings to the point of combustion, then to the combustion-chamber, where, meeting the hot air issuing from the hot-air chamber, all the gaseous products become ignited. The bars have openings at the top, and the heated air which issues from them assists the lower portion of the fire, thus contributing to thorough combustion. Although the foregoing applies to the ordinary range, it is by no means confined thereto. By means of an inexpensive alteration the principle can be adapted to the majority of existing stoves. The invention not only effects distinct economy in the consumption of coal, but there is a decided increase in the amount of heat produced, and the production of smoke and soot is effectively prevented.

THE ADVANTAGES OF ACETYLENE.

A motor-vehicle, fitted up at a cost of twelve hundred pounds, is at present touring through Great Britain to demonstrate the possibilities of acetylene for lighting, heating, and cooking; while it also brings before the personal notice of the rural worker the value of oxy-acetylene welding. A farmer or other rural industrial worker may have a breakdown in his mechanical equipment which local resources are quite unfit to cope with, and there is a complete cessation of work until the repair has been made, entailing a delay of several days while the breakage is made good in some distant workshop or a new

piece is under order. Oxy-acetylene welding is able to remedy this serious difficulty very materially, since simple repairs which a few years ago would have been quite impossible can thereby be carried out cheaply and quickly. For instance, a rural resident finds that a cylinder of his motorcar has broken. His car is useless, the motor has to be stripped and sent to the manufacturers, and for days the owner is deprived of the use of his vehicle; but if the local mechanic possesses an oxy-acetylene welding plant, which is inexpensive, the repair can be made on the spot, the time lost being reduced to one or two days. Every rural mechanical workshop should include such an equipment in its plant, as its applications are illimitable. This demonstration motor-vehicle is also equipped with a complete kinematograph outfit for the purpose of showing in the village schoolrooms and halls, by the aid of films, the complete manufacture of calcium carbide, its shipment, and its use; and incidentally it will reveal how every hamlet may become possessed of its kinematographic diversion, acetylene being utilised as the illuminant.

LESSENING HOUSEHOLD DUTIES.

The complexity of domestic duties is such that any little device which is able to reduce worry and trouble is keenly appreciated by the Recently many natty industrious housewife. time and trouble savers have been introduced, which are certain to meet with general approval. For instance, it is often necessary to separate the yolk from the white of an egg. The general process is to chase the elusive yellow ball with a spoon, and more often than not it is broken in the process. But with the yolk-separator the desired result is achieved in an instant. This appliance is a glass vessel with a funnel-shaped top. When the egg is cracked and the contents of the shell are emptied, the white escapes through the opening in the funnel, leaving the yolk intact and dry. In this way both are immediately available for their respective uses. Another contrivance which will save considerable trouble and worry is the frying-pan cover. It resembles the cover of an entrée-dish, and fits the fryingpan neatly. When the cover is placed in position the grease will not sputter over the stove or the clothes of the person superintending the cooking, and all odours are prevented from escaping into the house. By the aid of this simple contrivance frying is no more unpleasant than boiling.

THE LARGEST PADDLE-STEAMER.

Probably very few, except those who have traversed the Great Lakes of the North American continent, have any conception of the vessels to be found upon those great fresh-water seas. Recently a record has been made in those waters by the appearance of the Seeandbee, which ranks as the largest side-paddle-wheel steamship afloat. Her over-all length is 500 feet, and her extreme

beam 97.8 feet. Her lines follow those general to the lakes, the freeboard being high, while the four smoke-stacks give her an imposing appearance. The hull is built entirely of steel, and the double bottom, 365 feet in length, has a depth of 3 feet. The hull is subdivided by eleven watertight bulkheads, which extend from the keel to the main-deck. Fireproof walls extend from the main-deck to the top of the dome, dividing the craft into three divisions. The vessel is fitted throughout with automatic sprinklers to safeguard her against fire, this precaution covering all the public and private rooms of the passengers and officers, the cargo-holds, the corridors, and the quarters for the crew, so that it would be difficult for fire to secure a hold. The boat is driven by three-cylinder compound engines developing twelve thousand horse-power, which is sufficient to produce a speed of twenty-two miles per hour. The Lake Liner, as she is proudly named, is luxuriously appointed, there being five hundred and ten staterooms and twenty-four parlours en suite, and altogether there is sleeping accommodation for fifteen hundred passengers; but when engaged in excursion traffic she can carry three thousand Although there are many imposing people. vessels plying on the Great Lakes, the Secandbee is the most magnificent which has ever been launched upon those fresh-water seas.

CLEANING THE HULLS OF VESSELS BY ELECTRICITY.

An interesting demonstration of scouring the hull of a vessel by the torpedo submarine shipcleaning system was given recently in the London Docks. A single-screw steamship of three thousand tons was selected for the purpose. The cleaning plant, which is complete, is mounted upon a self-propelling barge carrying a petrolelectric set for the operation of the cleaner. The current thus generated is supplied to three motors, one of which propels the barge, another controls the lifting and lowering of the gear, and the third the driving of the cleaner. The last-mentioned comprises a coir brush about five feet in length by twelve inches in diameter, mounted upon a frame carrying an enclosed motor, which not only revolves the brush, but also drives a small screw propeller attached to the brush-frame in such a manner that when revolving it serves to keep the brush fully pressed against the surface under treatment, and also by agitating the water in the immediate vicinity assists in the cleansing-work. The weight of the brush-frame when immersed is lessened by the use of air-tanks. The brushframe can be manipulated so as to bring the brush to bear upon any desired part of the submerged surface of the hull, and enable it to be manipulated under projections such as the bilge keel. The brush can be worked to a maximum depth of thirty-two feet. It is claimed that by the aid of this apparatus a vessel of three thousand tons can be cleaned in about six hours. The weight of the whole installation, including the barge, is only eleven tons. The plant can be manipulated in a dock, river, or the open sea with equal facility and success.

THE SCIENTIFIC EXPLOITATION OF THE KLONDIKE GOLDFIELDS.

Many years have passed since the discovery of the Yellow Fleece in the extreme north-west of Canada by Skookum Jim and his pard sent a remarkable tremor round the world. Nowadays little is heard about the wonderful Klondike; to many it is but a fearful memory. Yet no less than forty million pounds' worth of the precious metal has been won from the streams and paydirt. Although many of the first to file their claims within the auriferous belt grew rich, the greater number failed to make ends meet, and disposed of their holdings for what they would fetch. Labour was the greatest problem, and when men refused to lift a finger for less than twenty-eight shillings per day, it is not surprising that many, in disgust, abandoned their efforts to grow rich quickly. A friend of the writer, who was one of the first to reach the El Dorado after the strike had been declared, paid no less than fifty shillings for the hire of a man and his horse for eight hours. Under these circumstances it cost about eight shillings to work a cubic yard of the gold-dirt-a price which was too great to render the task remunerative. But since those strenuous days many changes have been made. The majority of the claims have been gradually acquired, until to-day the whole of the Klondike has been brought under the sway of three large, well-organised concerns, one of which is Canadian, one American, and the other British. The lastnamed controls no less than twenty thousand acres of auriferous land. The acquisition of the many scattered claims has enabled the latest and most up-to-date time and labour saving scientific methods to be introduced to advantage, so that the cost of working has been reduced from eight shillings to fourpence per cubic The utilisation of scientific methods has not only rendered the exploitation of untouched gold-bearing dirt profitable, but it has enabled enormous quantities of gold to be recovered from that worked by the original miners, whose processes did not enable them to obtain more than a small proportion of the metal contained in the earth treated. In fact, in one case a company, working the miners' residue, which yielded the pioneers working with primitive hand methods some four hundred thousand pounds' worth of metal per mile, obtained a further three hundred thousand pounds' worth of gold per mile. Contrary to general belief, the gold resources of the Klondike, so far from having 'petered out,' are only just beginning to be realised, and many hundred millions of pounds' worth of the Yellow Fleece still remains. As California passed from the 'get rich quickers' into the hands of scientific exploiters, so has the Klondike undergone a similar transition. Even the intense cold and the long winter, which were said by many to be insurmountable obstacles to the possibility of the Yukon territory becoming one of the great goldfields of the world, have failed to arrest scientific development. Many of the terrors associated therewith have proved to be more imaginary than real, and so far have not been sufficient to stop work during the winter months.

A RELIEF MAP OF GUATEMALA.

In reply to correspondents in the Spectator who suggested the possibility of constructing a large-scale relief map of England, 'Q' gave a quotation from a pamphlet on Guatemala issued by the Daily Picayune of New Orleans, showing that such a map had been constructed there. It was arranged by the orders of President Estrada Cabrera, and unfolds to the tourist a panorama of the republic. This relief map covers two thousand five hundred square yards, and is built near the Palace of Minerva. It shows in every minute detail the rivers, mountains, plains, and hills of Guatemala. Every railroad line, every wagon-road, every bridge is reproduced in colours with mathematical correctness and absolute exactness of location. Every town, city, and hamlet is shown, with their streets and buildings in miniature. Thousands of people who have seen it declare it is a mathematical wonder, and that its usefulness has more than compensated for the time and money expended in making it.

To Correspondents who wish fuller information regarding new inventions mentioned here, addresses will be furnished, when possible, provided a stamped and addressed envelope or post-card be sent to the Editor, 339 High Street, Edinburgh.

BEREAVED.

I MISS thee from the old familiar ways,
Grown sad and strange without thy presence dear,
Where I must needs 'go softly all my days'
Because thou art not here.

O silence that thy dear voice may not break!
O paths thy feet may never tread again!
O memories that only sleep to wake
A deeper note of pain!

And yet, because thou 'dst have me brave and strong, I will not dim thine armour with my tears.

Thine ear may catch the echo of my song, But, ah, the lonely years!

M. HEDDERWICK BROWNE.

. TO CONTRIBUTORS.

1st. All communications should be addressed 'To the Editor, 339 High Street, Edinburgh.'

2nd. For its return in case of ineligibility, postage-stamps should accompany every manuscript.

3rd. To secure their safe return if ineligible, ALL MANU-SCRIPTS, whether accompanied by a letter of advice or otherwise, should have the writer's Name and Address written upon them IN FULL.

4th. Poetical contributions should invariably be accompanied by a stamped and directed envelope.

PÈRE MUMBART.

A STORY OF THE SIEGE OF PARIS.*

By Andrew W. Arnold, Author of The Attack on the Farm, Pepita, The Sergeant's Luck, &c.

PART I.

'YOU were remarking, André, the other day,' said Alphonse, 'how often success has come from downright audacity.'

'And ruin too.'

'Well, never mind that, because in that case,' he added dryly, 'it is called rashness, or even stupidity. But here's a case in point,' he continued, pointing to a beautiful villa in a suburb two leagues from Paris. 'You see that benevolent old gentleman coming down the carriagedrive with his little granddaughter. He's one of our gros bonnets; he has been mayor twice. He was a député a few years ago, but he found ten thousand francs, with pickings and perquisites, not worth his while. He is one who owes his position and huge fortune to audacity, or pure and simple impudence if you like. It is true, his audacious and amusing enterprise only brought him in about twelve thousand francs, on account of the pourboires he had to give his confederates; but he got that in ready cash. And as at that time no one had any ready money, and thousands saw ruin staring them in the face, it was worth three or four times that amount, and he took every advantage of it.'

'Tell me how he got it,' I said, pushing

some cigarettes towards him.

'Well, his father was a small pork-butcher in the Rue du Bac. There is as much of what you English call "snobbery" among the poor as among the rich, only in the case of the former you call it ambition; so his parents thought they would put him to a profession, and as the Church is the cheapest, they decided to make a priest of him; and at fourteen, much against his will, he was sent off to a seminary. His brother joined the father in the business; while his sister made a great name for herself as a dancer, beginning at a café chantant and ending at the Variété, where she sang in Offenbach's Grande Duchesse; and finally married a Russian Count.

'Mumbart had been a curé a few years when his parents died within a short time of each

other; and, coming into a third of the little property, he threw off the soutane and calotte While his brother looked and entered civil life. after the shop he bred pigs near Asnières, the brothers sharing the profits of the two concerns between them. But Mumbart's brother was a fool, and finally shot himself; so Mumbart was obliged to take over the business. Some years after he had left the priesthood he married, sold the pork-shop at a good profit, and kept entirely to breeding pigs. He made money, paid his way, put by something for the children, and led a useful, contented life; but that was all. He had a smattering of Latin, which very much impressed those who knew even less; and, moreover, he was a fine speaker and debater, knowing thoroughly how to make black white or white black. He was thinking he could make more money by politics, when the war broke out. Then it was that fortune held out her hand, and he took it. Of course the price of pork, as the war went on, rose 50 to 100 per cent., and as the Prussians got nearer to Paris even higher. Most of those who owned pigs killed and salted them as soon as they realised that a siege was inevitable.

'Mumbart was going to do the same, when, about ten days after Sedan, he had a veritable inspiration. It came to him like a vision in the night. He sent his wife and children to Switzerland, where she had relations; while he kept her nephew, who was a cripple, to help him in his enterprise. Then he went off to Paris to see a cousin named Blanard, who owned huge furniture-vans and did removals. After a satisfactory interview he perambulated the city. Countless buff-coloured cards with Appartement à Louer hung in the windows, especially in the best quartiers, whence the well-to-do people had fled; but though he trudged about the city from morning to night, he could not see one that altogether had the strategical position that he required. However, on the following morning he saw one in the Quartier St Germain that would suit him exactly. This whole block has now been swept away. The house No. 1. with a door in one of the side-streets, went right across to another street. Both of these small

FEBRUARY 7, 1914.

^{*}This incident is founded on fact, and caused great amusement in Paris during the siege, after it came to light; but no two newspaper accounts agree, and this version is only given as narrated.

streets lead into the Boulevard St Germain. The appartement he wanted occupied a corner, opposite some vacant ground where houses were about to be constructed when the war broke out. From the concierge he learnt a good deal; amongst other things, that the block was owned A Monsieur Achille Bardar was by a syndicate. the head of it. The entrance to his appartement was in a corner of the oblong courtyard; while the rooms, except the entrance-hall, looked on to the vacant ground where the new street was to be; but there were two small windows round the corner, looking into one of the narrow streets.

'Nothing would suit Père Mumbart's purpose better if he could only get the owner to let the

" Monsieur Bardar is in," said the concierge, "mais il est très affairé à la suite de la guerre; to-morrow he leaves to join the reserves of his regiment at Dijon."

"Give him my card," said Mumbart. "If he can see me you shall have something for yourself."

'The card bore the inscription, "Theophile Losnay, Ecrivain," and in the corner, "Membre de l'Academie des Gens des Lettres, Nancy."

'In a very short time Mumbart found himself in a beautiful salon furnished quite à la dernière mode; pretty rubbishy knick-knacks from Eastern climes, such as are given for wedding presents, were on the tables, arranged in a way that showed a feminine hand. The mantelpiece was a work of art. Carved in marble were two hearts formed as two crests tied by a lovers' knot, and curly ribbons, and cupids all about, to say nothing of turtle-doves. Bardar's father had made a fortune from a perfumery business in the Rue St Honoré. His wife was the daughter of a soap-boiler at St Denis. On both sides, after the manner of rich parvenus, they went in for the "old family" farce. That accounted for the elaborate crests.

'From an adjoining study a tall, thin, elegant young man, very well dressed, about thirty-five, with a pointed beard, delicate hands, and a prim manner, came forth and bowed ceremoniously to

the ex-priest and pig-breeder.

"The misfortunes of our country," he said in a high, affected voice, "compel me to let this charming appartement. Je suis père de famille; je suis homme d'affaires; but duty calls me, and to-morrow I go forth to answer the call of la Patrie. I sacrifice myself on the altar of Glory. France, my sacred mother, needs the help of her children."

'He had got all this by heart, and said the same phrases to every one; but he did not think it necessary to state (for Mumbart's benefit) the amount he had spent in bribing doctors who had hitherto freed him from serving, so he said nothing about that. "You, I perceive, Monsieur Losnay, are a writer."

"Yes," replied Mumbart; "I am at present engaged on a great work on the history of China. I have placed my family in safety. I now intend, if I can find a quiet dwelling, to write steadily for three months; by that time I trust these cursed Prussians will be driven from the country. need quiet and repose, as I mean this to be my chef d'œuvre, a work of reference for future ages."

"A book on China!" exclaimed Bardar in surprise. "That must indeed be very interesting. I am honoured by making your acquaintance. It's an extraordinary country, I suppose."

"Yes, indeed," replied Mumbart, who had picked up a little about China from a Jesuit missionary who had come to lecture to the novices at St Sulpice. "Wonderful mountains, rivers, pagodas, and all that sort of thing. I have only got up to 2000 years B.C., but I hope to finish the book before the New Year."

'On leaving the fashionable College of St Barbe, Bardar had got into a scrape; the young lady had been persuaded to go to America with a lump sum, while Achille took a tour of three

months till the affair blew over.

"I have never been as far east as China," said Bardar, speaking in a more natural tone, and forgetting for a time the rôle of the patriot and the père de famille; "but when I was young, from a pure love of the arts, I went to Venice. I have seen the pinnacles of that marvellous city glimmering in the moonlight. I have visited Constantinople, Florence, and the Eternal City; and as the dawn broke I have gazed with rapture on Soractus, and when I think of it, those lovely lines of Horace always come into my head, 'Vides ut alta stet nive candidum Soracte.'" He had got this out of a guide-book, and it was the only line he knew, so when Mumbart continued, "Nec jam sustineant onus," &c., he was fairly astonished.

"Ah, I perceive you are a man of education, a man of culture. You also adore the arts. Those," he continued, pointing casually to some dreadful water-colours, "are my handiwork. My wife thinks very highly of them. I have some more in the salle à manger, sketches I have done of her and Loulou, my eldest, and Bebé. But time presses. What are you prepared to

give for this lovely suite?"

"Well, I have not seen it yet," replied Mumbart. "I tell you again I must have a quiet room where I can write.'

Accordingly, Bardar showed him round.

"I'll give you three hundred francs to the 31st December."

"Three hundred francs!" exclaimed the other, aghast. "Why, it's furnished!"

"But you can take away the furniture," said Mumbart. "I would like to bring my own in. Think of the books of reference I want!"

"But if I took the furniture out I should have to pay to store it," replied Bardar.

"So shall I," answered Mumbart; "that really adds to the rent."

"But I reckon it is worth two thousand five hundred francs a year."

"Of course it is, in normal times," answered Mumbart. "But it's just as you like," he continued nonchalantly, as he had learnt a good deal from the concierge. "Here's the money in advance; it's so much profit. I have a good stock of coal and wood, which I shall bring here, so your works of art won't get musty. However, it's just as you like. There are plenty of other places to let."

"But I must have references."

"In ordinary times I could have given you plenty," said the pig-dealer; "but, alas! the war has upset everything. However, my friend Mumbart, a rich rentier at Asnières, will answer any questions."

"I have no time to go there."

"Well, there is one Blanard by name, who does removals, in the Rue des Petit Pères, quite close—I am sure he will give you all the information you require; or there is an épicier named Didot in the Rue Buonaparte."

"Well, I will think about it," said Bardar,

"and let you know at six this evening."

'The fact was, with men failing right and left owing to the war, and the prospect of many of his tenants being away, and those who stayed being unable to pay up, Bardar resolved that if he could get about four hundred francs he would let his visitor have the rooms. That sum would at any rate pay his expenses to England, where he meant to emigrate the following morning.

'Mumbart quickly finished his business with his cousin Blanard, who had the furniture repository, and then he made his way to Didot in the Rue Buonaparte. Didot was a great, heavy,

bald-headed Burgundian, about forty.

"A word with you," said Mumbart to Didot, who seemed anything but pleased to see his visitor. "You owe me two hundred francs; I owe you one hundred and eighty. You just do me a favour, and I will put it down in black and white that we owe each other nothing."

'Greatly relieved, Didot nodded.

"A dressed-up, finicking idiot called Bardar," continued Mumbart, "will call soon. Now, understand that I want an appartement he has to let, so tell him that as a tenant I am as safe as the Bank of France. My name is now Theophile Losnay."

"Losnay!" replied the grocer, in surprise.
"I had better write that down"—which he did.

"And, moreover, I am a well-known author.
I am writing a book on China."

"On China!" repeated the other, scratching

his head. "Why China?"

"Why anything, you idiot?" replied the other sharply. "Because I say so; that's why. Do you follow me?"

"No, I don't," answered the muddled épicier.
'Luckily at this point Didot's wife came in.
She was an extraordinarily pretty little woman, with bright, sparkling eyes, as quick and clever as her good-natured husband was stupid, and,

moreover, fairly faithful. In a very few words Mumbart explained matters to her, and at once she understood everything. Just at that moment a voice was heard in the shop inquiring for Monsieur Didot.

"That's he," whispered Mumbart hurriedly.

"You leave everything to me," said madame in a low voice, pushing the two men into the passage, as the shop-boy brought in Bardar's card.

"My husband is engaged for the moment," she said, as Bardar stepped into the little room, making a gallant bow as he saw the remarkably pretty young woman before him. In fact, he was so surprised at her beauty that he almost forgot the speech he had prepared; but, pulling himself together, he said in as calm a voice as he could, "A Monsieur Theophile Losnay has referred me to your husband. He wishes to become a tenant of mine. You know him?"

"Of course, monsieur. You mean the eminent writer. He is one of our most valued clients. You are lucky to have such a safe

and respectable tenant."

'Mumbart gave Didot a nudge of satisfaction, and Didot winked at Mumbart proudly, as much

as to say, "Isn't she mighty clever?"

"I am glad to hear you say that, madame," returned Bardar, "because I am rather pressed for time, and there will be no need for me to make further inquiries." Then, in an oracular high tone of voice, he continued, placing his hand on his breast, "Je suis père de famille, moi; je suis homme d'affaires; but to-morrow je salue le drapeau de ma Patrie."

"Monsieur, accept my admiration," interposed

nadame.

"Duty calls me," continued Bardar with a bow, "and I sacrifice everything. To-morrow, forgetting all, my wife, my children, I shall once more become a militaire."

"I dote on the militaires," said madame.

"Do you?" replied Bardar, forgetting the patriotic rôle, and coming nearer. "I was sure you would. The fact of it is you are devilish pretty, with such lovely eyes as you have got, and with such"——

'Up to that point Didot had remained quiet, but he never bargained for this, and he showed signs of uneasiness.

""Psh! psh!" whispered Mumbart; "it's all

right."

"Is it?" replied Didot angrily. "Leave go, will you?" he cried, as his friend restrained him. "What do you mean by bringing that sacré coquin into my house? Hark! Why, he's trying to kiss her!" he continued, struggling violently.

'But Bardar had heard the noise. "Hush!

that's my husband," said madame.

'That was quite enough for Bardar. Seizing his hat, he went off as quick as he could; but it took some time ere Mumbart and the wife could pacify the jealous husband.

'At six o'clock that evening, after a good deal

of haggling, apart from arranging about the provisions left, Bardar agreed to take three hundred and fifty francs till 31st December.

'There were fifteen tenants in the house, but quite half of these had left, for one reason or another, on account of the war. At six o'clock the next morning most of those that remained were waiting to bid adieu to their landlord. First and foremost, Major Ledelle, a gay bachelor of sixty, with a rubicund face, white moustache, and mischievous and rather watery eyes; Monsieur and Madame Legrange; Monsieur Diaz, a retired député; Monsieur Mardin, ex-colonial governor, with his wife and two daughters, Celestine and Angelique, both delicate and of uncertain age; Monsieur Charbot, originally a poor organist, who had married a rich widow; and one or two others. As most of them meant—if they could, and the war gave them a good excuse—to get off without paying the next quarter's rent, they were very glad to see Bardar go, and were accordingly very effusive; but with all this they assumed as sad a look as they could, such as they deemed suitable to the occasion.

'As the clock struck six Bardar appeared en civile, carrying his képi and his uniform in a brown-paper bundle. He shook hands with each, and then in a broken voice told them of his sacrifices for his country; but Honour, Patriotism—ay, and Vengeance, he said, called him, and he hastened to obey. With these words on his lips he stepped into the fiacre, and in a loud voice told the cocher to drive to the Gare de Lyon, en route for Dijon.

"He's off to Switzerland," said the Major dryly as the fiacre disappeared. But the Major was wrong, for when Bardar had gone down one or two streets he got out, leaving the parcel under the seat, and paying the cocher, said he would walk; which he did to the Gare St Lazare, whence in due time he arrived safely

in England.

'The locataires might, in the ordinary way, have lived in the same building for years scarcely knowing each other; but the war, the approach of the Prussians, and the appalling misfortunes of their country had brought them together; one had lost a son, another a brother, and so on, and they sought mutual consolation and sympathy. The arrival of a new tenant, when most who could afford to do so had left, naturally caused some commotion among the small community, especially when it was known he was a celebrated writer.

'The gas had not yet been cut off, but it was sparingly used, as were candles; so most of the locataires went to bed early. Close on midnight on the day of Bardar's departure, a two-horse furniture-wagon arrived in the courtyard. Mumbart, the cripple, his nephew, and an elderly man arrived with it. The latter was Blanard. On some mattresses and bags of wood and coke being removed from the end of the wagon, several sacks were taken out. With marvellous quickness and perfect silence these sacks were carried upstairs, while the old man and the concierge remained There were violent movements in the sacks, but no sound proceeded from them.

"Roll up that Turkey carpet," said Mumbart sharply to the cripple as the first two sacks were thrown on the floor. It was impossible to take away the table, but the new-comers had no sentiment, and all the fancy screens and chairs, all the sacred lares et penates, as Bardar called them, were thrown anyhow into a neighbouring bedroom. For a quarter of an hour Mumbart and the cripple toiled up those stairs till the perspiration ran down their foreheads. Then the wagon was drawn out of the courtyard, and only just in time, for at that moment the inquisitive Major returned from his club, where he had been holding forth, showing what Bazaine and Trochu ought to do if they wanted to clear the country of the infernal Prussians. Half-an-hour later another great furniture-wagon arrived, waking up all the But the silence was not so profound this time. Madame Legrange, without troubling to put on her front, looked through the curtains, but saw little except a lantern.

(Continued on page 168.)

A LOST TREASURE IN THE GREAT SOUTHERN OCEAN.

THE departure from New Zealand of a fourth expedition of adventurers, whose objective is the salving of the bullion that went down in the wreck of the gold-ship General Grant, brings vividly to the memory of some of us the chief features of that disaster. They form a tale well

worth telling.

In all the long roll of maritime disaster, the loss of the General Grant is probably unique. The vessel drove right into a huge sea-cave, and foundered within it in the thick darkness, shut in by walls of rock. Over half-amillion in gold and one hundred human lives is the tale of loss in the disaster. Ballarat, Bendigo, and other goldfields of the southern El Dorado had each contributed their quota to swell the passenger list. Lucky diggers these, returning to the land they loved with the wealth their toil had won them. The private wealth carried on the vessel is variously estimated at from one hundred thousand pounds to one hundred and fifty thousand pounds, and it is probable the latter sum is the more nearly correct.

Many of the diggers were accompanied by their wives and children. The women and children aboard numbered forty, and the total of the ship's company, inclusive of the crew, amounted to one hundred and eleven.

In addition to the private wealth aboard, there was in the vessel's strong-room Government gold consigned to the Royal Mint to the value of four hundred thousand pounds sterling. Packed in iron-bound hardwood boxes, the contents of each box approximated in value to five thousand pounds in twenty-pound bullion ingots. The ship's manifest also shows the shipment of fifteen large cases of spelter ore. No zinc was mined in Australia in those early days, and it has been stated that these—purposely cased and marked as inferior metal as a precautionary measure—were actually filled with gold ingots. Of course this is a secret that the sea holds close, one which must wait for elucidation until such time as the weed-grown wreck shall have been explored.

The General Grant sailed from Melbourne on 7th May 1866, and on the night of 14th May went to her fate within the cavern known to mariners as Sarah's Bosom, in the savage cliffs of the Auckland Islands. The cave is four hundred feet high at the entrance, with a width of three hundred feet.

Those were the days before the advent of the swift ocean liner, direct cables, and wireless telegraphy. A vessel putting out for distant ports, but for the fortuitous chance of speaking passing ships, went practically out of human ken often for a period of several months. But it was known or conjectured within six months that the General Grant had vanished, leaving no sign. She had failed to reach London, her port of destination, but of her ultimate fate and of those aboard her nothing was known for eighteen weary months. The sudden horror of the actual disaster is perhaps best pictured in the narrative of Quartermaster James Teer, one of the nine survivors:

' For twelve hours the fog had held. The wind had fallen, an' we lost steerage-way. a big sea running, an' we wallowed through it like a hay-barge in a tide-race. The strain o' the wet canvas, dragging on the yards at each wide roll, was like to take the sticks out o' her, an' the skipper stripped her down to courses an' maintopsail. Thick? Why, you couldn't see your own hand for fog. The night was only a bit clarker than the day. The binnacle-lamp might as well ha' bin a farthing dip for all the good it was. Ted Coglan an' me was at the wheel, trying to keep her end on to the seas that boosted under her sternpost. There was a distant growl o surf in the air. The fog was full o'it, an'it seemed getting louder. The "old man" hadn't seen the sun for three days, nor a star, an' couldn't rightly get his bearings. Not that it would ha' made a ha'porth one way or t'other if he had. There was no wind, no steerage, an' we was in some sort o' current. There was nothing for it but to trust to luck an' let her rip.

'Jim Bissett an' the first mate was on the look-

'Twas two bells in the midnight watch. "Breakers ahead!" came in a scream from the fo'c'sle-head. "Breakers on the port bow!" There was a blacker loom through the haze, which I knew was rock. I jammed the helm hard over. It was no good. O' course she wouldn't answer. A big sea lifted under our stern, caught us up like a chip, an' chucked the old barky, bow on, right up against the cliff. I waited, an' looked around for a bit o' spar to grab hold to when the crash came. There wasn't any crash! The sea swept us clean through that cliff into a pit o' darkness beyond. Breakers thundered to port an' starboard, but under our keel was the high roll o' the heavy swell. Dark? Deck-lanterns showed up no bigger than pin-points. "We're in a cave," sings out some one—the second mate, I think, from the voice.

'Up to that the passengers were mostly below decks, snug in their berths, out o' the wet. But at this the "old man" gives the word, "All hands on deck. Lower away the boats. Women an' on deck. Lower away the boats. children first. Women to the starboard quarter boat." Above the din o' breaking spars an' falling chunks o' rock, knocked off by our masts an' yards, the captain's voice sounded from the waist The roof o' the cave lowered as we o' the ship. drove in. Royal-masts an' to'-gallants jammed against the roof, snapped off short at the fids, carried away, an' fell in a tangle o' hamper. Twas all over before you could wink. Some one had struck a blue light. From the wheel we could see the crowd about the boats, their faces all ghastly in the blue flare. Twas just the picture o' a moment. Then the muck o' masts an' gear fell on them in a heap an' shut it again into the dark. Out o' the dark came screams an' curses; an' that was all. Ted Coglan was hanging on beside me. "Help," he said, "the women an' the little children! the women an' the little children!" Over an' over he kep' sobbing it, like a prayer. I had my orders, an' hung to the wheel. My fists was cramped to the spokes with sheer horror. Dazed I was, an' daft.

'The topmast-heads beat against the roof as we lifted an' dropped on the swell, an' I knew 'twas the end. There was one or two heavy jars, a crashing o' stout timbers, an' the masts drove clean through her bottom. The forepart o' the ship went under, with a surge. The stern lifted, an' as she steadied to the plunge she canted to port till her taffrail stood no more than a foot above the water.

'Into the dim circle o' the binnacle-light the captain struggled up the sloping deck, a woman in his arms. The dark loom o' a spar flashed by on a backwash, an' they were gone. I saw the mate fighting his way aft, chest-deep in water, an' his head streaming blood. But he never reached us.

'Then I seemed to wake up like. The captain's gig still hung to the falls. Collaring Coglan, I

pitched him into it, fell in myself, an' began to cast loose. Out o' the dark came rushing other figures that leapt in beside us. The binnacle-lamp was still burning. I caught a glimpse o' a white bundle clinging to the wheel-grating. "Shove off! shove off!" yelled the men in the boat, an' fought to get clear o' the sinking ship. Into the dim light two shadows struggled, grappling. "By heaven!" I heard one shout, "my wife goes first." I saw the flash o' a knife, heard a scream, an' a man leapt toward us, a woman in his arms. Next moment we were away, almost, as the ship swirled under. It was Jewell who killed the other man to save his wife—acting-stewardess she was. Poor girl! she was in her night-gear, an' sobbing with cold an' bitter fear. But her man wrapped his pilot-coat around her, an' she won through.

'How did we get out o' that cave! Ah, there Providence took a hand; I don't know. Next thing I remember is waking up along o' ten others

on a bank o' shingle at the cliff-foot.

'Gold? Oh yes, I saw the escort bring it alongside at Port Phillip, an' helped to stow the boxes in the strong-room. But, you mind me, sonny, there's times when a man 'u'd give all the gold in the world for a staunch deck to his foot, a fair breeze, an' good sea-room. The stuff's there yet, under six fathom water, an' there it can stick for all I care.'

This is Teer's story of the wreck. Afterwards, until his death in 1878, Teer was employed at the pilot station, Wellington, N.Z. It was here the writer knew him, and made notes of the tale as he told it.

How the survivors scaled the cliff and endured all the hardships of an eighteen months' sojourn on the barren island is told in the newspapers of the period. Those were the days before the establishment of depots for shipwrecked mariners -of warm huts, means of fire, and store of meats and biscuit. It was not till 1887 that these things were provided. The islands have ever borne an evil reputation. Even now they are seldom visited by passing ships. At present the Government of New Zealand despatches a steamer on half-yearly visits in search of castaways, but at the time of which I write the chances of rescue were infinitely remote. For food the castaways lived on sea-birds' eggs and the flesh of sea-lions killed with clubs of driftwood-uncooked food for the most part. It was winter when they were cast away. Everything was sodden with damp and frost, and it was not till the return of the brief summer that they succeeded in striking fire to some dried herbage with flint and knife-blade. They made themselves clothes from sea-lions' skin as some shelter from the freezing gales that thundered continuously from the south. Exposed as they were to the fierce rigours of Antarctic winter, the wonder is that any survived to be rescued. Two succumbed to hardships endured, and it was not till November 1867 that the nine who remained were rescued by the brig Amherst, and carried to Invercargill, N.Z.

Three expeditions have sailed at various times to attempt the recovery of the treasure. On each occasion the adventurers were foiled by death and disaster. The divers were drowned, the boats smashed to matchwood, and their crews lost. The last expedition put out from Lyttelton in October 1876, and although the weed-grown timbers of the wreck were clearly seen two hundred yards within the cave, beneath the water, and the position of the strong-room located, the roll of death was the greatest. Ere diving operations could be commenced, one of the boats, with its crew of eleven men, was dashed to pieces against the wall of the cave. The crew of the second boat saw their comrades drown in spite of all efforts at rescue, and they themselves only escaped by the skin of their teeth. So sudden and furious are the storms in that latitude, so bitter the weather, and so heavy the westerly swell rolling into the cave, that approach by boat is hazardous in the extreme; and since the expedition of 1876 until the present day all attempts at recovery of the gold have been abandoned.

The lesson of former failures has been well learned, and the present adventurers, it is said, intend to proceed on entirely new lines. All seaward operations are to be abandoned. The headquarters of the expedition will be on the island itself. The roof of the cave, at a spot immediately above that where the wreck lies on the floor below, is to be pierced by a shaft from the cliff-top. A huge caisson of iron will then be lowered down the shaft to the wreck through the intervening water, and thus it is hoped all danger from the swell will be avoided.

As an alternative should the first plan fail, the overhanging cliff at the cave's mouth will be blown outward on to the sill. Superimposed above the cave's roof, it is calculated, there are more than two million tons of rock. It is claimed that the fall of a moiety of this mass at the mouth, by interposing a breakwater against the rush of the heaviest seas, would ensure calm water, in which divers might work in safety within the cavern.

Of the fleet of gold-ships that, before the establishment of Sydney Mint, carried the wealth of Australia to the Old Country, only two failed to make their ports in safety—the General Grant and the Royal Charter. The latter ship was wrecked on the coast of Anglesea, with much loss of life and of bullion to the value of four hundred and eighty thousand pounds. This treasure, however, was recovered a few years later by salvage operations conducted from Liverpool. Equipped as they will be with all modern improvements in salvage methods, there seems no reason to suppose that the present bold adventurers will prove less successful in recovering what still lies on the floor of Sarah's Bosom.

A KNIGHT ON WHEELS.

By IAN HAY, Author of The Right Stuff, A Man's Man, Happy-go-Lucky, &c.

CHAPTER X .- THE ECCENTRIC GENTLEMAN.

IT was a lovely morning. Philip, tramping vigorously along a Hertfordshire highway, felt that if all his adventures were to be conducted under such a kindly sun as this he would have little to complain of. But at present his most pressing desire was to get as far away from the residence of Mr Montagu Falconer as possible.

He had quitted that restful establishment some three hours previously, escaping from durance by the simple expedient of opening the French window and walking out on to the lawn. He had caught an early morning train into the country, and, having travelled as far as one-and-ninepence would carry him, had also covered a considerable distance upon two sturdy legs. But he was uneasily conscious of the avenging power of the Law, which, goaded into activity by his late host—Heaven only knew on what charges!—might be interesting itself on his behalf over all the countryside.

Still, he felt that he had no alternative. If he had accepted Mr Falconer's pressing invitation to remain and be arrested at nine o'clock that morning, a still more involved situation would have arisen. For one thing, Pegs and Mrs Falconer would have been dragged into the fray—which would have been a most unnecessary complication; for apparently their choleric but obtuse protector had not scented their presence in the plot at all. They would certainly have confessed complicity and taken Philip's side; and this would have led to a domestic upheaval of a most monumental character. So Philip had cut the Gordian knot by running away.

It was eleven o'clock. He had breakfasted off the very inconsiderable remains of his supper, and was now acutely conscious of the existence of an excellent digestion clamouring for employment. He tramped resolutely along the wide country road, fingering the sum of elevenpence which remained in his right-hand trouser pocket,

and wishing he could come to a shop.

He also speculated as to his future. He was a clear-headed little boy; and though he had led a secluded life, he had spent it almost entirely with grown-up people, and was accustomed to marshalling facts and weighing probabilities. He ran over the list of his accomplishments and limitations.

He had no Latin or Greek, but was a good stenographer and typist. He could keep accounts and file correspondence with method and neatness. He was a promising mathematician, with a useful but unsystematic acquaintance with mechanics and physics. He had read and reread some twenty of Shakespeare's plays. He

knew long passages of Milton and Tennyson by heart, and was well up in the history of ancient chivalry. His favourite book was Sir Thomas Malory's Morte d'Arthur; next in order ranked a string of well-thumbed science manuals. It may be added that he had never read a novel in his life. The foundation-stone of nine novels out of ten is a woman, and the coping-stone thereof is love made perfect; so, naturally, such works had found no place upon Uncle Joseph's shelves.

He was fairly expert with singlestick and rapier, and could play piquet and double-dummy bridge with more than average skill. But he knew nothing of cricket and football; and the ordinary joys of the schoolboy's holidays—pantomimes, parties, and the like—were a sealed book

to him.

His labours on behalf of the Kind Young Hearts and Thomas Smith had introduced him to a large and varied, if unusual, circle of acquaintance, and he possessed a knowledge of human nature and the world in general that a seasoned

man about town might have envied.

For some time back his thoughts had been occupied with the contemplation of a suitable The profession of Knight Errantry career. having apparently fallen into desuctude, he had been compelled to resign himself to the prospect of a more humdrum occupation. With the true instinct for the surviving possibilities of romance, he had decided to become an engineer. Like all boys of the present age, he was consumed with a desire to understand, direct, and control machinery, especially the machinery of the automobile. The numerous cars which whizzed up and down the Finchley Road were an abiding joy to him. He could tell the make of any of them-just as a woman can tell the make of another woman-by the cut of its bonnet. Number-plates attracted him especially, for they stimulated his imagination. When a mudsplashed car displaying the letters S.B. stole silently past him in the gathering darkness, he realised with a thrill the bigness of the world; for this weary giant, now slipping into the roaring heart of London, had come all the way from the fastnesses of Argyllshire. He paid a penny a week for a small but highly technical journal which dealt with the latest mode in such things as sleeve-valves and detachable rims. He even executed designs of his own, inventing tires which never punctured and carburettors that never choked. So now, with the choice of a career suddenly thrust upon him, he had no difficulty in making up his mind. It had been made up for some time. At this very moment he was on his way to Coventry, whence he

knew that vast numbers of motor-cars emanated. What he was going to do when he got there he had not definitely settled. He felt that he already possessed certain saleable merchandise in the form of clerical skill; this he proposed to barter for technical instruction. He would arrange details when he reached Coventry. Philip was essentially one of those people who decline to think of the Vistula until they have crossed the Rhine.

Presently he came to an old, lofty, and warmly tinted brick wall, skirting the road for nearly a quarter of a mile on his right, and evidently sheltering some venerable house and garden. As he approached, Philip observed a large noticeboard jutting out for all to see:

MOTORISTS

PLEASE DRIVE SLOWLY ALONG THIS WALL. IT CONTAINS TWO HIDDEN GATES.

A quarter of a mile farther on, where the wall ended, came another board, which said, simply:

THANK YOU!

Philip's comment on this pretty device was characteristic. 'What a beast you would feel, he said to himself, 'if you didn't drive slowly, and then found that "Thank you!" sticking out at the end!'

He made a mental note that if ever he possessed a car of his own, and came to this wall, he would comply punctiliously with the request upon the first board, and so earn the right to read the second. He added a rider to the effect that if ever he possessed a house of his own like that, he would put out a similar board.

He had scarcely passed the second of the concealed gates—the first was a mere kitchen door -when there was a grinding of bolts, and the gates were dragged open, slowly but resolutely, first one and then the other, by a small but intensely fat girl of six or seven. This proceeding exposed to view the front of an ancient and ivy-clad house. Exactly opposite the front-door stood a motor-car of antique design and dilapidated appearance. From beneath the car projected a pair of human feet, attached to a pair of lengthy legs. The owner of the legs was apparently doing something painful to the underbody of the car, from beneath which came a stream of objurgations of a bloodthirsty but innocuous

type, punctuated by the clink of a spanner.

The small girl, breathing heavily, stooped down to inspect these operations. Presently, adopting a more comfortable but somewhat reptilian attitude, she crawled bodily under the car. Here she encountered the head of the

mechanic, who was lying on his back, engaged apparently in the task of removing mud stalactites from the bottom of the car with a spanner. As fast as the stalactites were dislodged they fell into the excavator's eyes or mouth.

'What are you doin' of, daddy?' inquired a

husky but interested voice in his ear.

'Eating mud,' replied the mechanic. did thing for the digestion, Dumps. 'Splen-Have some ? '

'No, thank you,' was the dignified reply. 'I shall be havin' a glass of milk at twelve. But I will watch you,' added Miss Dumps indulgently.

She rolled over with some difficulty on to her back, and lay staring solemnly at the mudencrusted vault above her, while her harassed parent resumed his task of digging with the spanner for a buried nut.

'I've opened the gates, daddy,' announced the small lady presently, in tones which were intended not so much to convey information as to remind her companion that he was forgetting his duties as a conversationalist.

'Thank you, madam,' replied Mr Mablethorpe. 'Is the road clear?'

'I seen a little boy.'

'Trust you for that! Well, we must contrive not to run over him. Just look in my left ear and see if you can find a nut, there's a good girl. I rather fancy I heard it drop in just now. No, don't bother. Here it is in my eye. Now we are really getting on!'

He adjusted the nut to the now exhumed bolt, and began to screw it tight with the spanner. The recumbent Dumps turned her head and regarded him admiringly.

'You are clever, daddy!' she said.

'You are right,' admitted her parent modestly. 'I am a wonder. People come simply miles Dash and confound the rotten thing! Run your finger round the inside of my collar, Tichborne. I think I can feel it lying somewhere round at the back.'

Once more the fugitive nut was recaptured and replaced, this time permanently. Mr Julius Mablethorpe wriggled painfully from under the car on to the gravel drive, and then, rising to his legs, politely dragged his daughter out by the heels, and having first stood her upon her head (in order, as he explained, to give her feet a rest), restored her to an upright position, and surveyed her doubtfully.

'We shall get into trouble with mother,

Dumpling,' was his first remark.

He was right. At that moment the frontdoor opened, and Mrs Mablethorpe appeared. 'I can only say, Julius,' she began at once—as a matter of fact, no one had invited her to say anything—'that I am not in the least surprised at anything you may do; but I think -her voice quavered tearfully—'that you might have had the sense to prevent that child from crawling about in the mud too.—Baby, go into the house and ask nurse to give you a bath at once. Your hands and face are black!'

'But I am quite white, mummy,' replied Miss Dumpling soothingly-one soon picked up the habit of speaking soothingly to Mrs Mablethorpe -'all over the rest of myself. Look-I'll show you!' Before any one could stop her, the infant had detached a stocking from its moorings and rolled it down to her ankle. 'There!' she said triumphantly.

Mrs Mablethorpe, fearing further enterprise, hurriedly reiterated her ultimatum on the subject of a bath. 'A good hot one,' she added.

'The kiddie would do much better to wash her hands and face in cold water,' said Mr Mablethorpe. 'What she is covered with is chiefly oil, and hot water will only open her little pores and drive it in.

Mrs Mablethorpe put her hand to her head dizzily. 'You know I cannot bear argument,

Julius,' she said, with a little moan.

'Sorry!' said Mr Mablethorpe humbly.-'Dumps, we must do as we are told. We will go upstairs and wash in hot water. Then we shall have black hands and faces for months and months, and mother won't be able to take us to church. Hurrah!'

And this undutiful parent and callous husband caught up his daughter upon his shoulder and carried her, shrieking joyfully, to the nursery. Five minutes later he descended, clean and smiling, and after caressing his hypochondriacal spouse, set to work to start up his engine. After three backfires this feat was accomplished, and the car, with much burring of gear-wheels and slipping of the clutch, started off upon its deafening career. The vehicle in question was an old friend, and, like most old friends, felt privileged to speak its mind on all occasions—which it did with no uncertain voice.

Mr Mablethorpe, having safely negotiated the gateway—no light feat, considering the amount of play on his steering-wheel-turned sharp to the right and proceeded northward. Presently he came to four cross-roads. At the foot of the sign-post sat a small, sturdy, and well-dressed boy, with short curly hair and hazel-green eyes.

As the car slowed down in case of cross-traffic the boy rose to his feet, and, ranging up along-

side, asked a polite question.

Mr Mablethorpe leaned over as far as he could. 'Is it very important?' he yelled above the din. 'If I stop this engine to listen to you I may never be able to start it again.'

Philip replied with the full pressure of his lungs, but the only distinguishable word was 'Coventry.' The amiable Mr Mablethorpe accordingly switched off the current, and the engine clanked itself into a state of coma.

Now let us hear all about it,' he said.

'Can you please tell me the way to Coventry?' inquired Philip.

Coventry, eh? Have you been sent there?'

Mr Mablethorpe's eye twinkled.

'No. I'm going of my own accord,' said

Philip innocently.

'First time I have heard of a man sending himself to Coventry,' mused Mr Mablethorpe. He surveyed Philip's bewildered face with interest. 'Perhaps you don't catch the allusion, Don't you ever send any one to though. Coventry at school?'

'I have never been to school, sir,' replied Philip.

'That's a pity,' said Mr Mablethorpe. 'But to resume. Coventry must be a good eighty miles from here. Do you propose to walk? 'Yes.'

Mr Mablethorpe eyed the pedestrian curiously. 'Running away?' he asked.

'Sort of,' admitted Philip.
'Well, I have only one motto in life,' said Mr Mablethorpe, 'and that is, "Mind your own business!" So I will refrain from comment. I don't know where Coventry is; but I should think you would not go far wrong if you kept along this road, and asked again later. Now, with your permission, I must be getting on.'

Mr Mablethorpe had not proceeded far upon his way—to his surprise and gratification the engine had come to life almost immediately—

when his conscience smote him.

'I might have offered the little beggar a lift,' he said to himself. 'Silly not to have thought of it. He has a longish journey before himthat is, if papa doesn't lay him by the heels. I might stop and let him overtake me. I wonder where he is.' He leaned over the side of the car and surveyed the road behind him.

(Continued on page 164.)

THE CULTURE OF HOUSE PLANTS.

By a PRACTICAL GARDENER.

HOUSE plants and cut flowers having greatly increased in popularity, this article is intended to suggest remedies for plants in a poor condition that might become well-grown if carefully treated and skilfully watered.

'How often should this plant get water?' is the question invariably asked by a purchaser.

This question cannot be answered off-hand, as some people imagine; but as watering is a most essential factor in successful plant-culture, it is necessary to give it careful consideration. For example, we will take two well-drained plants, and proceed to give each of them a drink. One has well filled its pot with healthy roots, while

the pot of the other contains more soil than roots. Both get a good steep in water at about the same temperature as the room wherein they are growing, until the air-bubbles which the heavier water forces out of the soil cease to come to the surface. When this takes place the soil is saturated, and the roots have a good chance to absorb what they Afterwards the difficulty that presents itself to the inexperienced is when to water the plants again. The answer to this is that water should not be given until the soil has become fairly sweet or dry. This condition occurs through loss by evaporation from leaves and soil. The rate of this loss depends on the moisture or dryness of the atmosphere. The plant in the pot full of roots will be ready for a drink in a quarter of the time required by the sparsely rooted plant. Therefore it is evident there can be no hard-and-fast rule laid down for any stated period to elapse before giving water. So the only reply is that a plant should be watered when it needs water.

When watering is done with a watering-can, care must be taken that the ball of soil is thoroughly moistened at every watering, or failure is likely to follow. When a plant gets too dry, and its foliage withers, the ball of soil shrinks from contact with the pot and leaves a space, with the result that the water given runs down between the ball of soil and the pot. The plant looks as if it were watered, but in reality it is starving; the delicate tendril roots become shrivelled, and the plant's function of taking up water and food is paralysed; the foliage fades through want of nourishment, and then follows total collapse.

Still taking two plants for illustration, let us turn now to the equally common mistake of giving too much water. We gave our two plants a good watering, say, a few days ago, and the well-rooted one is ready for another drink, and rightly gets it; but its companion with the scanty roots is still in a state of comparative saturation, although it may on the surface look dryish, so it gets a little too, just to keep it going. This is where the inexperienced may blunder; for, owing to the soil becoming cold and sour, no warm air having permeated to evaporate the moisture and dispel the acids generated, the roots perish. Foliage plants, especially in warm weather, must have their roots kept rather moist, but not constantly saturated. In watering and feeding plants, one person should have sole charge.

Another point worth noting is that the largeleaved foliage plants require a regular weekly sponging with warm soapy water. This keeps the pores open and helps to keep off the insects which otherwise would soon overrun and disfigure the plant. The worst insect pests foliage plants have to contend with are the scales. These are small, round, and white, but sometimes brown, and are found especially on palms. A good method of getting rid of these pests is to lay the leaf flat on the hand and scrub them off with a worn tooth-brush and warm soapy water, taking care not to injure the leaf. Among flowering plants, the green fly is the principal enemy to get rid of. Tobacco or quassia may be used for the purpose, as they may be safely handled by the amateur, and leave on the foliage a bitter taste most unappetising to the insects who are on the lookout for a meal.

Coming back to the subject of watering, it is safe to say that for flowering plants the treatment is much the same as for foliage plants. Let the plants become fairly dry before giving them a drink.

Nourishing or feeding plants is done by repotting, top-dressing, or giving manure in a liquid state. In potting, see that there is ample drainage composed of broken crocks or rough cinders; suitable soil can be got from the florist. Now turn the plant requiring repotting out of the pot, and rub away the old drainage and any exhausted soil or old roots; place the plant in the new pot, which must be dry and clean, and add the fresh soil, at the same time making it firm with a wooden rammer between the old ball and the pot. Most plants thrive best with firm potting. Then finish by watering. Keep the plant shaded and close for a while, being careful not to give water for some time after this operation, as the plant gets a check, and no circulation goes on until the roots are active, which in a cool room generally takes from a few days to a fortnight. Potting may be done about the end of April and in May, when the sap is on the move and there is no fear of a cold set-back. Top-dressing is done by removing with a fork some of the top exhausted soil, taking care not to destroy any tender roots in the process, and to add fresh soil, either mixed with some approved manure or without it, to replace the old soil. Or the soil may be loosened without removing it, and bone-meal sprinkled, a teaspoonful to a six-inch pot, twice in the growing season. There are various fertilisers sold in tins, clean and handy for home use; but these must be carefully used, for the fertiliser becomes a roison instead of a food if applied too often, as the different fertilisers vary in strength, and plants also vary in their requirements and as to the time when food should be applied. Directions as to quantity to be used are generally printed on the tins. The fertilisers may be given in weak doses to foliage plants such as aralias, aspidestras, and strong-growing palms and ferns, if they have plenty of healthy feeding roots.

The following hints on using these patent manures are worth noting. See that the soil is fairly moist when you apply them. Never apply them when the soil is dry, as they would be carried directly down through the soil, injuring the roots on their way, and get lost through the drainage-hole. When starting to feed plants in spring, begin with small doses. Stop feeding at the end of summer, as stimulated growth in the dull days and long dark nights of

winter is poor and weak. Flowering plants with plenty of roots and starting to flower require more nourishment than foliage plants, as they have to carry on the extra functions of flowering and reproduction.

In summer, foliage plants should be kept shaded from the sun from 10 A.M. till about 4 P.M., as they are liable to be scorched; while flowering plants require plenty of sun and air to ripen the wood that produces the flowers.

Worms in the soil are apt to disarrange and clog the drainage. This can be remedied by using lime-water, made as follows: Pour two gallons of water on one pound of fresh burned lime, stir well, and let the liquid stand forty-eight hours; then, having stopped the holes in the pots, deluge the soil with clear lime-water only, when the worms will come to the surface.

As to giving air, the most successful amateur gardener we know is a lady who cares for her plants exceedingly well; and they are such a picture of health that it could well be believed a professional gardener had them under his charge. All their wants are attended to personally, nothing being left to maids or others. Her method of giving air in cold weather is to shut all doors in the rooms, and open the windows a little from the top; whilst in the summer she judiciously lets in more air, top and bottom, as required. Of course one must discriminate between cold and warm air entering a room, and act accordingly. Cold air playing directly over palms

and similar plants means sure failure; therefore efforts should be made to keep them out of a draught. For room plants, a safe minimum temperature in winter is forty degrees; and while very hard frost is prevalent, plants should be moved back from windows for safety, and covered with brown paper or some such light covering, the soil being kept dryish. If, by accident or any want of forethought, a plant should get frosted, it should not be taken into a warm room to thaw. There is no surer way of killing it. If a plant is exposed to an atmosphere below freezing-point, the moisture in the sap-cells of the plant is drawn outside the membranous walls, and there frozen, the plant becoming contracted in the process. When thawing takes place, if done quickly in a high temperature, the frozen sap is suddenly melted, and as it is not able to find its way back through the membranous walls quick enough, the cells are burst by the expanding sap, and the plant is ruined. What should be done is to take the frozen plant into a room only a few degrees above freezing-point, sprinkle cold water over the foliage, and keep it shaded. This treatment allows the frozen sap to melt gradually, and gives it time to find its way back through the membranous walls of the cells to its former position.

From the foregoing it will be seen that plants are much like ourselves, and require a suitable environment, so that what life is in them may be lived at its best.

THE MASTER-KEY.

By IGNOTUS.

THE big clock in the Ordnance Yard was striking twelve as the noonday gun in the fort above the saluting battery on the hill boomed out its confirmation of the clock's accuracy, and immediately a chorus that seemed to have been waiting its cue chimed forth from the cathedral; silvery and clear, the notes dominated the everyday noises of the town, and I gave orders for the men to cease work and fall in, preparatory to marching back to barracks.

I should judge by the look of relief on their faces that they were not sorry, for a November sun in the West Indies seems, to those obliged to labour in it, to shine with almost a personal intensity; and shifting heavy ordnance stores, varied by packing camp equipment, is not precisely the sort of work one would select for choice to while away a tropical morning.

At the shout of 'Fall in, there!' men emerged from all sides like rabbits from a burrow; and while they were putting on their jackets and the roll was being called I sent for my pony. As it arrived the tally was complete, and the party of hot and dusty men marched sturdily through the big yard-gates, to be swallowed up

in the shimmering heat of the white coral road outside.

Shouting to my grizzled colour-sergeant, the very incarnation of a trustworthy subordinate, to take charge, I turned up a road on my right leading to the pay-office to draw the men's weekly pay; and, that wearisome business settled, I rode slowly back through the town to the little white-walled club. The green jalousies, drawn full down, were restful to the eye after the glare of the white road, and seemed to promise a pleasant coolness within; and as the hands of the cathedral clock pointed to a quarter to one, I was fairly certain of meeting congenial company.

In this surmise I was not mistaken, for, as I climbed the stairs and glanced into the darkened veranda, a little knot of men in one corner shouted to me to join them in throwing dice for the ante-luncheon cocktail. With my usual luck I found myself let in to pay for the lot; and, calling the negro 'boy,' we gave our orders.

Vickery, the heavily built, red-bearded man of Devon who managed the Cornucopia sugarestate in the Roseau Valley, was evidently turning over in his mind some conversation that had been interrupted by our general appeal to Bacchus, and, sluing himself clumsily round in his cane chair, he said to Martin, the chief of police, 'Well, what then?'

'Nothing, I'm sorry to say,' replied Martin, 'because, try as I would, I couldn't get the old beggar to speak again. Either he regretted having said so much because he thought he might unwittingly have put me on the track, or he feared something of our conversation might find its way back to the other squatters; for he gradually assumed that irritating air of stolidity that is such a safeguard to a negro when he does not mean to speak. Either way, I could get nothing more out of him, and so dismissed him.'

The subject was indeed one of general interest which at times assumes an acute form in the West Indies, being nothing less than obeah, or witchcraft. The negro, though those who do not know him would little suspect it, is one of the most conservative persons on the face of the earth; and although for some three hundred years he has been domiciled in the West Indies, the pagan rites and ceremonies that his heathen ancestors brought with them from West Africa when they were kidnapped and imported to labour on the sugarestates still linger; indeed, they show at times a most surprising vitality all the more astonishing when it is remembered that he has had the benefit of the white man's civilising influence and has accepted with ardour the tenets of Christianity. Not only does the average negro in the West Indies attend the morning and evening services, but numerous chapels-of-ease exist where negro ministers expound the gospel on Sunday afternoons, so that in many cases the day is one long orgy of churchgoing. Notwithstanding all this, close observers are convinced that the average negro's religion is far more superficial than is generally supposed. One of these revivals was just then suspected to be agitating the native mind; and as the practice and observance of obeah is associated with the most bloodthirsty cruelty, it is very rightly suppressed by law.

When indications seem to point to its practice the white community is naturally uneasy; and vague hints and suggestions had kept Martin pretty busy for some time past, though the very vagueness of the rumours had militated against his taking any definite action.

The conversation once more became general, and even reminiscent, old Charrington contributing what threatened to prove a blood-curdling account of occurrences on his father's property fifty years ago, which fortunately was interrupted by a servant coming in with a message that Dingley, the harbour-master, was wanted below.

I looked at my watch. 'One o'clock, by Gad!' I said; and the group broke up, dispersing to lunch either in the club or in their bungalows near by.

I followed Dingley downstairs; and while I was having my pony brought out from the club

stables he came to me, half-humorously bewailing his fate at having to leave the lunch which was just ready for him, and go off to a sloop newly arrived in the harbour.

It appeared there was a dispute between the captain of the sloop and the port officer of health, who had refused to grant her pratique—that is, a clean bill of health, and the consequent right to land—because of a shrewd suspicion that, despite her skipper's denials, she had come direct from a port where yellow-fever had been raging.

We walked the few steps that separated us from the wharf to have a look at her while Dingley's boat was getting ready to go out. There she lay in the stream, a typically dirty, gray-white native sloop flying the yellow quarantine flag, with a rope's-end trailing untidily astern, and her brasswork much in need of a little spit and polish. Close by, one to port and one to starboard, lay two water-police boats, fully manned, keeping watch and ward to see that the isolation ordered was maintained.

'Well, you are a fool, my dear chap, to let your luncheon get cold on account of a filthy hooker like that. Why don't you wait, and go off to her afterwards?'

'Not quite so much of a fool as you think, my son,' said Dingley with a grin. 'That's what I used to do—take my ease and let the beggars wait my convenience; but some of them grumbled and made a fuss, and the matter came to the Governor's ears; so his Excellency sent for me, and in a very friendly way gave me an unmistakable hint that, as a Government servant, I had better readjust my ideas of duty. Consequently now I don't give the beggars a chance of complaining if it is at all possible to go off and set matters right.'

'Very well, then, off you go,' I said; and mounting my pony, which they had brought me, I rode home. I got back to barracks, and, finding young Lister and a couple of boys still in the luncheonroom, amused myself by recounting some of the stories I had heard at the club, whereby I flattered myself I could see the hairs rise one by one and stand on their heads unsupported.

'Ah, my boys, you never know your luck, and what you'll see next,' I remarked; and, finishing my luncheon, I left the room hastily to avoid laughing at their faces.

As the afternoon waned and the air felt cooler, some of us crossed the harbour to go up to the tennis-courts on the hill. It was still pretty hot ashore, as we could feel by the difference in temperature directly the garrison boat pushed off and we got the sea-breeze coming round the point; but as the eel gets used to skinning, so too does the average Briton become pretty well heat-hardened. He does not necessarily enjoy it, but he learns to look on it as an unavoidable accompaniment to life in the tropics, and in this he is wise.

In an idle, detached way, as the boat crossed

the harbour, I looked for 'Dingley's sloop,' as I had mentally christened her; and, not being able to spot her, I made inquiry of our coxswain, who, with the nonchalance of the British tar, replied that he 'adn't seen nothin' of no sloop; anyway, there weren't nothin' there when the garrison boat come over at noon'—a piece of information that was given in a tone which suggested that I was suffering from a touch of sun.

We came alongside the landing-stage, and went up to the tennis-courts at the top of the hill. Some of the courts were occupied, but we found an empty one and soon got to work. Our set finished, I put on my coat and walked across to speak to Mrs Lawrence, the wife of the Colonial Secretary, and one of the most deservedly popular women in the island. Gray-haired and far-spent in years, she had the most marvellous tact and ability in reconciling opposing factions such as only too readily spring up abroad; and her success in this direction had been so marked that it was commonly accepted that should Lawrence ever die suddenly, his widow would at once add to her exiguous Government pension by taking a job as an animal-trainer in a wildbeast show. She was full of her boy's success at Marlborough, of which the last mail had brought news, the lad having gained his house-colours that term, to his great joy. While we were deep in a discussion of football and its many points, we were interrupted by Dingley, who strolled across to make his bow.

'Hallo, old chap, where 's your sloop?' I asked.
'Did you eat it instead of the lunch that was growing cold, or what's happened to it? I looked for it as we came across the harbour, and couldn't see a sign of it; and our coxswain, whom I asked, as good as told me I was dreaming.'

'Oh, well,' said Dingley in his slow, drawling way, 'she's gone. I boarded her, and being quite satisfied that she hailed, as she asserted she did, from Trinidad, I went ashore again, and talked it over with the doctor, who eventually granted her pratique; whereupon she landed a few native passengers, and at once stood out to sea again. She was out of the harbour by three o'clock, and, with a strong following wind, almost out of sight an hour later; so no wonder your coxswain regarded you with suspicion.'

Mrs Lawrence laughed, and the conversation veered to other topics.

There was a great deal of work going on just then in the Ordnance Yard, and it was therefore with no very great surprise that, a week later, I found myself one evening told off in the regimental order book to proceed with a working party to the yard next morning at 8 A.M. As we marched through the gates I nearly rode over Martin, who walked round the corner with such a preoccupied air that I had much ado to avoid him. I thought he looked rather haggard and drawn, even for the hot weather, and pulled up to speak to him.

'Gently does it, old boy! What's the matter? You're beginning to look a bit fine-drawn, and as though a trip home would do you no harm.'

'Trip home be hanged! Talk sense, my dear Preston,' was the irritable reply. 'I keep hearing about this obeah, and I simply can't find anything definite to go upon.'

'Haven't you any clue?'

'Clue!' said he. 'My dear chap, I've had dozens, all of which I've followed up, and all of them led nowhere. Besides'—and he lowered his voice with professional secrecy—'I've got another rather bothersome job.'

'Well, I can't stand here yarning all day, said I. 'I've got to get this party to work shifting stores. Come into the yard with me, and as soon as I have set them going we'll have a talk, if you like.—Now,' said I some five minutes later, 'I'm your man.'

'The fact is,' began Martin in a hesitating way, 'I've got a tracing job on. I mean to say I've got to try to find a fellow, and I'm really rather stuck for the next move. Do you happen to remember that about a week ago—exactly a week ago,' he corrected himself—'we were all sitting in the club having a cocktail, and that clumsy ass Vickery was trying to draw me, when all of a sudden Dingley was called for about a sloop—the Kittiwake she was—that couldn't get pratique?'

I nodded.

'Well, funnily enough, it has to do with that. You remember, she got pratique later, and landed some passengers?'

'Yes,' said I, 'I remember.'

'There were five passengers landed—three men and a boy in one party, and a woman alone. The woman is cook to Ryder,' he said, mentioning the biggest merchant in the town, 'and she had been to Trinidad to see a dying mother; and the three men and the boy belong to the Coulemin property, on the other side of Soufriere Hill, where Warren's new cocoa plantation is. At least, I thought they belonged to Coulemin, but I begin to doubt it now.

'Two days ago the mail came in, and it brought me a letter from the Trinidad police, saying that they had been notified of the disappearance of a boy, the son of a carter who lived near the Pitch Lake, and that they had reason to think the boy had been kidnapped and taken to one of the other islands. Every island within reach of Trinidad had been notified, and chiefs of police were being asked to make every endeavour to trace the movements of any children that had landed during the last month. The description given seemed topoint to the boy who landed here last Thursday, and the strange part of it is I can't trace the little beggar anywhere. You know how closenegroes are when you're trying to get to the bottom of a thing. In this case they're not only close; they 're hermetically sealed.

'First thing, of course, I rode out to Coulemin to find the three men, and had no difficulty in discovering them. Oh yes, they remembered

the boy, of course. The skipper of the Kittiwake brought him aboard, and they understood he was coming over here to live with an uncle. skipper seemed very harsh with the boy, and so they took him under their protection, gave him some of their grub, &c.; and when they finally got leave to land, the skipper asked them to put the boy on the road to Delcer, where his uncle lived.

'So far so good. I established quite independently that the men and the boy left the town together, and were seen just this side of the junction of the Coulemin and Delcer roads. Now, however, comes what I can't understand. Although admittedly they were together two days and three nights on the boat, and for several hours after landing, the men cannot remember (so they say) what the boy's name was, or the name of his uncle at Delcer, or what his business or occupation is, or in fact anything about him. Finally, no strange or unknown boy has lately come to live at Delcer. The men arrived at Coulemin during the night, and were at work with their gang the next morning, so apparently nobody saw them arrive; but one old mammy on the Coulemin road states that three men and a boy passed her one day about 5 P.M. going toward Coulemin, and gave quite sound reasons for remembering the date, which was last Thurs-

day.
'I saw Warren, and you know what a good for that gang chap he is. He at once arranged for that gang to work at bush-cutting next day on the far side of the property; and when we had seen them well away, he and his eldest boy and I went down and searched these men's huts, for they all pig in together. Quite illegal, of course; in fact, we should have got into serious trouble if we had been caught. But we drew absolutely blank, never found a single thing that bore the least reference to the boy, or that could connect them in any way with his disappearance.

'Strange!' I replied. 'Couldn't the men give any explanation of what had happened to the

boy?'

'I asked them, of course,' said Martin, 'and they gave the explanation that one might naturally expect-namely, that when they got to where the roads forked they put him on his proper road, gave him some grub they had left, and said good-bye; and since then they had not seen him.

'Well, their explanation, whatever it is worth, seems right enough,' I replied; 'and the only thing I can suggest is to have the bush and undergrowth on each side of the road from the cross-roads to Delcer thoroughly searched. But for goodness' sake, my dear chap, don't look so worried and miserable about it. You can't do more than your duty, and everybody who knows you knows how conscientiously you do that.'

Poor Martin, somewhat consoled, took himself

off to his office, and I turned away to see how my working party was getting on.

We knocked off that day, as usual, at midday gun-fire, and I am afraid I rather bustled them through the streets on our way back, as I had a good deal of regimental routine work still to do in barracks, which I wanted to get through in time to play polo that afternoon. We had rather good polo that day, I remember, for the garrison had just issued a challenge to another island, and we were engaged in a series of eliminating games, so as to put the best representative garrison team that we could muster in the field.

People used to ride up to the ground sans cérémonie to look on, and that day the Governor's wife turned up to show the ground to some globetrotting people she had staying at Government House. I went into the pavilion to get a cup of tea after playing my second chukker, and paid my respects to her ladyship, who introduced me to a very pretty girl with the English bloom on her cheeks, and, in the kindly way habitual to her ladyship, asked me to dine with her that night—an invitation I was glad enough to accept.

As I got to Government House that evening I heard a pony trotting up the drive behind me, and looking round, saw Martin in his dogcart.

'Hallo, Preston! I didn't know you were

coming to-night,' he shouted.

'Nor did I till five o'clock,' I replied; 'but Lady Armstrong came up to polo this afternoon, and invited me then; and I am just as keen as you to talk to nice, fresh English girls when I get the chance. You had better send your mare back, and we can walk home nearly the whole way together, and enjoy the night, for there is a moon up till midnight.'

'Very well,' he replied; and as the butler

answered the bell the cart drove off.

We spent a very pleasant evening, for the party was small enough to be intimate. John told some yarns of his early experiences in Cyprus and Hong-kong which raised a laugh; the punkahs kept the room deliciously cool; and afterwards in the big drawing-room the pretty English girl sang us the latest London songs. and I was unfeignedly sorry when Martin nodded at me across the room to go. Our movement broke up the company, and there was a general dispersal to find wraps; while Carson, the Governor's aide-de-camp, sent word to stables for the various dogcarts and traps.

Martin and I murmured our thanks to our hostess, and were first away, passing the sentry at the entrance-gates before the driving-folk caught us up. Refusing the offer of a lift, we turned to the left down the hill, meaning before we turned in to walk through the town to the club to see the cables that arrived daily from London. The moon was brilliant that night, the coral road shone like silver, and all the myriad scents and enchantments of a tropic night were about us as we walked. Our talk was of home, and how we meant to spend our next leave. At the bottom of the hill we had to turn sharp to the right past the principal stores and the bank, and then to the left once more to reach the club.

As we turned the corner I noticed how sharply defined was the black line of shadow thrown by the roofs of the houses; it seemed to cut the road lengthways, and I was just about to make a careless remark on the subject, when Martin gripped my arm as in a vice.

'Hush!' he hissed. 'Can you see anything

down there, or is it my imagination?'

'Where do you mean?'

'Down there in the shadow, by the bank doorway;' and as he spoke he drew me unresistingly into the porch of an adjacent house, whose shadow swallowed us up.

I strained my eyes through the darkness, rendered all the thicker by contrast with the moonlight on the other side of the way; and, his excitement communicating itself to me, I began to tremble, though I swear it wasn't from funk. 'By Gad! yes, I can,' I whispered. 'I can see some men in the bank doorway.'

I felt the grip on my arm relax as he replied in his ordinary slow way, 'So that's all right. Somebody's trying to break in and rob the bank, and we must collar him if we can.' Suiting the action to the word, he came slowly from the porch, and we wriggled with the utmost caution along the wall to the next doorway, where we called a halt.

He then explained his plan, which, like those of all great commanders, was of the utmost simplicity. We were to continue this beastly cat-like crawl to the porch nearest the bank door, and then, on his giving the signal, were to make a pounce and collar a man apiece if we could. I didn't care for his plan very much, for I am a bigger man than Martin, and I felt sure they would spot me even if they couldn't see him; but I couldn't suggest a better one, so we slipped off our shoes where we stood, and started.

Things went very well, I must say. to our jumping-off place unnoticed, and when he touched me and started we were on the beggars like a flash. He jumped at the nearest man, and I collared the chap next to him; and as I did so I saw at least one other man making what my colonel calls 'a strategic movement to the rear.' They had their backs to us, and I leapt on my man and got my fingers well round his windpipe, which I pressed with all my force. I was conscious at the moment of a peculiarly repulsive smell that reminded me, as such things will, of some dead mules we once passed on the veldt in the South African war; but I hung on and strained back, so that we both came to the ground together, I in the rôle of the under-dog. I couldn't see Martin, but hoped he was all right; and as I wanted to get to bed that night instead

of spending it in the gutter, I hallooed for help at the top of my voice.

Some men in the club heard me, for the night was very still, and they came running out just as our regimental picket turned the corner. Last of all, of course, came a policeman; and while some of them took my man off my chest the others assisted Martin, who had never lost his head for a moment.

While our captives were being hauled off to the police station he sent to the club for a stablelantern to see whether the men had actually effected an entry into the bank. We couldn't find a scratch on the door; but that same queer, nauseating smell clung to it, greatly to my mystification. Martin swung his lantern into every corner of the porch, looking for tools, and I saw him suddenly grow as white as his shirt.

'Hold up, old sportiboy!' I said as I slipped an arm round him. 'This has been a bit too much for you.'

He recovered himself instantly, and I saw him stoop and pick something off the ground. 'Now come along to the station, Preston,' he said; then, turning to the others, he remarked, 'I won't have anybody else in.'

The station was only a few yards away, and I followed, but simply couldn't approach Martin, as the smell seemed to have transferred itself to him. As we entered I noticed the two prisoners in the dock, and the room was full of a motley crowd of police, soldiers, and a few civilians. They fell back and made way for us, and Martin, without a word, pushed through them to the inspector's room and shut the door. Then at last I saw what he carried, and understood the smell. He had picked up two human hands, and pretty beastly they were. I am a strong man, but I felt sick, I assure you.

Martin, his face alight with professional enthusiasm, turned to me. 'I've solved the mystery of that boy. This is obeah,' he remarked quietly.

Into the details of that horrible trial I do not intend to enter; nor would anything have induced me to listen to them had I not been obliged to attend and give evidence; but, put in a nutshell, they amounted to this: These three animals had determined to practise obeah, and for this purpose required a human sacrifice. They had chosen one as inconspicuously as possible, and, after murdering the boy and committing unmentionable barbarities with his body, had cut off his hands; and when we caught them they were in the act of applying the hands to the bank doors, believing that, according to the formula of an old superstition, at the touch of a dead man's hands the doors would fly open! The third man's body was found three days later floating in the harbour, and no doubt he had jumped into the water when he found the game was up.

Obeah has ceased since then, and I do not think we are likely to have a revival of it in my time. At any rate, I sincerely hope not.

THINKING BLACK.

THE Duke of Wellington once said to a friend that he had spent all his life in trying 'to guess what was at the other side of the hill.' explanation he further declared, 'All the business of war, and indeed all the business of life, is to endeavour to find out what you don't know, by what you do; that's what I called guessing what was at the other side of the hill.' We have all our own methods of finding out what is behind Explorers, missionaries, and envoys of the hill. commercial companies have 'bored' their way so successfully into the Dark Continent that the map of Africa has been transformed from guess-What is on the other work to authentic details. side of the hill has been made manifest to the world. To famous pioneers, such as James Bruce, Mungo Park, Robert Moffat, David Livingstone, H. M. Stanley, Speke, Burton, and Baker, we owe many great travel books. To these and many unnamed heroic souls we are indebted for much of our knowledge of Africa.

Slavery, that great open sore of the world, for the extirpation of which in Africa Livingstone battled to the end, did not seem quite to be healed even so recently as twenty years ago, as we gather from a remarkable missionary book, Thinking Black, by Daniel Crawford (Morgan & Scott). Slave-gangs still march from the interior to the west coast; and there is an echo in the book of the brutalities of the rubber districts of the Congo. One is reminded by this more recent writer, who spent twenty-two years without a break in the long-grass lands of Central Africa, of Stacpoole's vivid and realistic book, The Pools of Silence. In following Mr Crawford's progress from Benguella, on the west coast of Africa, by Bihe, Chokwe, and Luvale, to Lake Mweru, south-west of Tanganyika, we are brought into close contact with the native and wild life generally, and introduced to various Rob Roys of Central Africa, the worst of whom was Mushidi, who is described as being in character somewhat between a wolf and a pig. There is a lifelike picture of him and his five hundred wives (one of them white) at Bunkeya. He made Bunkeya a museum of skulls; and his own head, preserved in a petroleum-tin, was taken down to the east coast.

To the writer all things European seem to degenerate in Central Africa—provisions, fruit, as well as men and women. We are told that the merchants in Benguella and Catumbella snapped up as much black ivory as possible for shipment to St Thomas for cultivating the cocoa plantations. A caravan of eight hundred souls, including tottering old men, mere shrivelled sacks of bones, dozens of women, and little emaciated boys and girls, all doomed to exile for life, took nearly three hours to march past him. One girl whom he saved from death by the roadside became a happy Christian

mother on Lake Mweru. The market value of a certain boy, whose name became Sikispence, was one coloured handkerchief at sixpence. Another youngster, stolen when his mother was out in the field, was sold for one shilling and fourpence. Dilunga's child was sold for an old waterproof coat, Musole and her child for two small bags of grain. As to the mortality on the route, a slaver admitted that, if lucky, they might get six out of every ten natives alive to Bihe; and if unlucky, perhaps only three out of ten.

Mr Crawford describes some of the upside-down methods and customs of the negro. The ferryman sits with his back to the stern of the boat and his face to the bow; and sometimes a pair of socks are worn outside the boots. The negro is described as a congenital liar, and to him God is but a name to swear by. The Bihean eats dogs, the Luban snails, and another tribe mentioned and described eat human flesh. The bee-hive hut is called a verminating hole, a den of disease. This circular hut is the seed-plot of all the negro's 'thinking black.' When natives gather in a meeting they crowd in a circle, and they think and talk in a circle. Native carved stools and utensils are circular; the villages are circular; and the movements of a body of natives on the march are not in a straight line, but in and out along a twisted path. The author asks if this twisted itinerary is not exactly like their twisted morals. A naked negro means naked speech, and the men at fourteen are soon ripe and rotten. The Bantu curriculum is described as the university of the beasts. Certain tribes, when the chief dies, send down to death with him good healthy specimens of human beings for company in the other world. Lukatula shut two hundred natives in a house and roasted them alive—'a whiff of roasting viands from the devil's kitchen.

We have stories of mission-work round Lake Mweru, a district which Livingstone wished to visit in his last days. The book is a genuinely interesting human document, with far more character and individuality than most missionary and travel books.

AN ANGLER'S DAYBREAK.

THE mists of morning lift a little way,
Slowly the glen, the nearer hills, appear,
Rugged and grim; yet nothing is too clear,
But all things wear a robe of hushful gray.
Down on the shore, from out the shrouded bay
The sea comes singing in, moved to unrest
By a fresh wind that breathes from the southwest,

And woos my cheek in soft caressing play.

I hear the rush of many streams unseen,
I taste a wine-air, moist, wild-scented, pure;
And far aloft, where the great cloud-caps break,
Trace faint one mighty peak, apart, serene.
Dreary? Did ever dawn more cheering wake
The fisher to his first day on the moor?

NEIL E. MACLEOD.

TRAVELLING EXPERIENCES.

By ZENO.

PART I.

I HEAR that some people are fond of travelling. It even seems that most people are, except those who have to do it by trade or profession. Why people should like it is a puzzle to me. I do not understand the pleasure of being knocked about, riding in public carriages, eating off public plates, and sleeping in public sheets. If it were only people who cannot travel who liked it, then it would be quite clear. But not at all. People who have never been able to travel, as a rule, do not wish to do it. It is an acquired taste, as the Americans say of terrapin.

Those who enjoy travelling are not moved by curiosity. They know beforehand what is waiting for them. They go on the trodden path, to visit the same capitals, where they stop every time at the same hotels, dine at the same restaurants,

and patronise the same theatres.

No doubt there are some people who go to the museums, and see the sights, and so on. They are 'innocents abroad.' But for them travelling is a job, and it is a bad one. They never do it twice. They are under the bondage of Cook's agencies. They renounce freedom, conscience, and human dignity. They are told to go here and there, and they go here and there; to sleep in this hotel, and they sleep when they are not sleepy; to get up at seven, and they get up when they would like to sleep; to eat at that restaurant, and they eat things that are not naturally meant to be eaten; to admire, and they admire. were told to rob, they would rob. As it is, they are robbed instead by ciceroni, hotel-keepers, and café waiters; and they return home with a light conscience, a light purse, and a heavy regret at ever having left their cosy hearths. For them, to travel is a verb that it is only pleasant to conjugate in the past tense. I will not speak of these unfortunates. I pity them. My heart melts whenever I meet them.

But the others, those who know what travelling means, all the discomforts, all the deceptions, all the fatigue and robbery and poisoning they are going to be the victims of—it is a wonder to me that they travel. Perhaps it is the movement that induces them. Since science has discovered that everything in this world is motion—the heat, the light, the sound; that life, in fact, is motion—people seem to think that the

more they move the more they live. People cannot be quiet nowadays. Life in our time is a perpetual St Vitus's dance. Perhaps the disease is contagious, like individual chorea.

I am aware of the progress that has been made in travelling facilities and comfort. Still, I have been travelling for nearly thirty years, and I do not think I ever went as far as thirty miles without having undergone some unpleasantness. I shall not speak of missing trains just by a fraction of a second. Once I missed two trains in succession. I wanted to take a train before luncheon to go to town-I was then in the country. As I missed it, and the next train would leave an hour and a half later, I went home to have lunch in the meantime. I missed that train by one second. Trains have a knack of starting the moment you reach the platform. That is a certain cause of the universal spreading of nervous prostration.

Once I missed a steamer. I must confess that this case is not so common. I was then in Rome, and had booked a berth in a steamer that was expected in Naples, say, on Thursday, coming from Australia and going to Gibraltar. My experience is that steamers always arrive later than they are due. Of course it is never the fault of the steamer. It is the weather, or the fault of the steamer. It is the weather, or the fault of the steamer accident. Steamers are meant to be punctual when there is no weather or sea, and when there are no more accidents than the regulation ones, whatever they may be—accidents that are not unforeseen.

Well, trusting to my experience, I was sure that the steamer due on Thursday would not come into port before Friday. Consequently I took the night train on Thursday, and on Friday morning I was landed in Naples. I went directly to the agent's office and asked with an ironical smile if the steamer So-and-So would leave that day. 'Oh, the So-and-So came in a day sooner than she was expected. She left the day before yesterday at 3 P.M.,' was the gracious answer, which was delivered with an engaging grin showing two rows of dazzling white teeth such as can only be seen in Naples or in the mouth of stage villains. On second thoughts, I am not quite sure whether it is the teeth that are too white or the mustachios which

No. 168.—Vol. IV. [All Rights Reserved.]

FEBRUARY 14, 1914.

are too black. At the time I did not quite understand whether the steamer had left too soon or I had arrived too late. Such are the ways of the world. Everything is always too much one way or the other. People are too rich or too poor, too fussy or too lazy, too clever or too stupid, too deep or too frivolous. The weather is too hot or too cold, too dry or too damp. The days are too short or too long; life is too fast or too slow; even wives are apt to be too wifely or not wifely enough. There is no such thing as the juste milieu. As soon as you reach it, you find out that it is not in the least juste. It is the worst, dullest, most boring commonplace you can imagine. And because everything in this world is too much, or too little, or mournfully insipid, some people go travelling, and some commit suicide.

Take, for instance, elopements and honeymoon travelling. Two persons love each other. There are insurmountable hindrances to their coming together. Their opportunities are too few. They elope and go abroad. They take to travelling. On the contrary, everything favours the lovers. They marry. They are too much together, at least during the first month of their married life. Therefore they go away; they travel. Too little, too much—they have recourse to travelling.

There is much to be said in favour of honeymoon travelling. It is perhaps the only case in which travelling is excusable—nay, advisable. Any person of either sex who has ever been in love is aware that love is like a stream in this sense -that it is the obstacles that cause the falls and the rapidity and strength of the current. Now, travelling puts some restraint on the affections of a newly wed couple. It would be unconventional to see your own friends during the first period of that blissful state; but you may go abroad and see other people's friends. They do not know that you are just married, although they can easily guess it. Anyhow, according to the social canons, there is no impropriety so long as they are not sure that you are lawfully bound. At the same time, when your love is slackening, like a placid and fertilising stream, altogether too conjugal, the restraint that their presence imposes is enough to quicken the current and start it afresh. You must have something to hide, and somebody to hide it from, or you would not enjoy it. Oh dreadful perversity of human nature! To be perfectly happy you must deceive somebody. If there is no one else at hand, you must at least deceive your own self!

It is this power we have to deceive ourselves and our neighbours that makes life bearable. We live on illusions, our neighbours' illusions and our own. We could not decently live on realities. Of course every one of us has met disillusioned people. We may even be disillusioned ourselves. Some people think so. Some people believe that they have no illusions. Now, the greatest illusion of all is to think that

you have none!

People travel because travelling is an illusion from beginning to end. One starts with the idea that he is going to enjoy himself, to see new and better things, to improve his mind, and to rest from his labours. In reality, he is going to sleep badly and feed worse, and he could apply to the things he sees what Voltaire said to a novel-writer who asked the philosopher's opinion about a book of his: 'My dear sir, you express many good ideas and many new ideas; only the good ideas are not new, and the new ones are extremely bad.' The mind gets hopelessly confused, and instead of rest your life is a perpetual agitation. What with being in time for trains or to secure the best place for the new play; discussing fares with cab-drivers; losing your way in distant streets where there are no cabs, and your watch in crowds where the policemen have no time to listen to you; lighting upon gossiping acquaintances when you most wish to be incognito, and feeling depressingly lonely when you long for society; missing your luggage when you want it, and recovering it when you have given it upwith all those contradictory, useless, humiliating emotions, after a few months' travelling you return home a pitiable, tattered wreck, a disappointed, unnerved idiot.

But the worst of all in travelling is the means You take a steamer. I suppose of locomotion. you choose the best steamer, and you are not seasick. Many people prefer tramps or cattleships to the best liners. They explain to you that the food and attendance are much better, that such ships are much safer and have better accommodation than fast, overcrowded vessels. They enumerate all the advantages that induce them to take such abnormal means of conveyance. They forget only to mention that they are immensely cheaper. I suppose they are excellent, but I have never tried them. Being of a conservative turn of mind, I admit without discussion that cattle-ships are for cattle, and tramp-ships-well, I suppose they are for tramps; and whenever I am obliged to travel I am always in a hurry to reach a place of rest in this world,

not in the next.

I must acknowledge that I have had some delightful times on board the big liners. But all the pleasure has been derived from my fellowmartyrs and, as long as I was young, from my

healthy youth.

There was a time, for instance, when I was hugely amused by the exercises of a brigade of the Salvation Army going to Australia. I shall always remember a forcible speech made by a very pretty Salvationist introducing a dusky Australian native who had joined the Army. 'Look at him,' the pretty girl said. 'When he joined us his soul was as black as his face. And now, although his face is still black, his soul is white.' And I admired her love of truth for not pretending that her doctrines were a complexion beautifier. She might have showed her face and claimed that it was by joining General Booth's Army that it had become so pink-and-white. Leave alone her soul, she would make numberless converts among a lot of women whom it is my misfortune to know. She came very near enrolling me—I was then twenty-three—and, honestly, I did not care a rap for the shade of the Australian's soul.

In fact, I do not know what might have happened if the young lady-who, by the way, was a captain in the Salvation Army-had not been engaged to marry her own lieutenant. it was, I could only praise her wisdom in marrying a subaltern of her own company. It would be impossible to devise a better way of securing domestic peace. Any attempt at disobedience on the part of the husband would be construed as a case of insubordination, and punished accordingly. The marriage between the captain and the lieutenant meant martial law at home, with the wife as senior officer. Such a delightful state of affairs is far more common than is generally supposed or gracefully acknowledged either by wives or husbands.

Anyhow, every steamer does not include a brigade of the Salvation Army, and a brigade of the Salvation Army may be exclusively composed of white souls with ugly faces. What you are sure to face is abominable food. I suppose the navigation companies reason in this way: either the passengers are sick or not. In the first case, it is no good giving them good things to eatit would only improve the fishes' fare; in the second case, they are so hungry that they will devour anything that has the remotest possibility of being swallowed. And the companies are quite right. Besides, as there is no chance of taking a decent amount of exercise on board ship, so long as you satisfy your greed it makes no difference whatever whether you are properly fed or not. There is a line of steamers that prides itself on having never lost a passenger's life. I will not mention names, in order to avoid an action to recover damages. But once, while I was sailing on one of its fine steamers, the food I ate made my existence so miserable that I did not care to have my life preserved till the end of the voyage.

Another time a friend of mine took a steamer at Lisbon to go to England. The steamer was on her return trip from South America. She miled in the evening. Next morning my friend, who is an excellent sailor, sat at the breakfasttable with a strong appetite invigorated by the sharp sea-air. He had had in his cabin a cupful of a dark liquor, made of indefinite burnt beans, which in maritime slang goes by the familiar name of coffee. I have never inquired deeply on the subject; but it must have some remarkable medicinal properties, for it is a most unpleasant stuff, and still all the steamers provide it the first thing in the morning. A malignant fellowtraveller once suggested that it was meant to produce seasickness and save the victuals; and an unsophisticated one asked the steward, 'If this is coffee, bring me some tea; and if this is tea, bring me some coffee.' Anyhow, my friend was disposed to indulge in a hearty breakfast. When they brought him a steak he tried to cut it, but it was impenetrable to fork and knife. He redoubled his efforts, but the steak stared at him with true British stolidity, like the English infantry under the attacks of the French at Fontenoy. He gave it up at last, acknowledging his defeat. Summoning the head-steward, he blamed him for having Argentine beef, which must necessarily be tough after being two weeks in the cold stores of the ship, when they had just called at Lisbon, where he could have got fresh provisions. 'Argentine!' remonstrated the indignant head-steward. 'Argentine, sir! Excuse me, sir, it's English beef!' and he turned away with dignified contempt. My friend felt himself thoroughly beaten by the toughness of the English steak and the national pride of the English steward. He was never the same man again.

Another disagreeable thing on board ship is the number and variety of offensive smells. It is impossible to say which smells worse, the engine or the kitchen. But they think that is not enough, and they add disinfectants. Our forefathers were quite satisfied with the plague that God Almighty sent them; they did not increase the miseries of life by disinfecting everything that fell into their power. I wonder when we shall get over the microbe-hunting fad. We have outgrown witchery, aristocratic prejudices, and the indissolubility of marriage. When shall we outgrow the microbe fad?

Railway travelling, at least, is free from disinfectants. The trains may be sumptuous and neat, or poor and filthy. In any case, they are always dirtier than they look. But then that is the case with everything in this world, with the sole exception of the shaggy heads of some great artists, which look much dirtier than they really are. On the railway we travel in the best of fellowship with millions of microbes. We eat them, we drink them, we breathe them, we sit on them, they sit on us, we sleep in each other's arms, and, to tell the truth, we feel none the worse for their company—much better, in fact, than when eating, drinking, and breathing carbolic. But there are other discomforts, and much more serious ones.

The fare in the railway cars is never of the choicest. I do not know how it happens, but it seems that they grow special breeds of animals and vegetables to be consumed in the trains. Sometimes I have suspected they were all mineral matter, perhaps nothing but coal and iron. There was a time when the trains carried no provisions, and travellers had to alight at certain stations where there were restaurants. The incautious diner who began his meal by soup never went beyond that. The soup was brought, most appe-

tising, and so hot that one had hardly succeeded in swallowing the first spoonful when the signal was given for the train to start, and the poor traveller had to pay for a whole meal, and leave it untouched or miss the train. The hungry looks of the starving traveller were really pathetic in those prehistoric times.

(Continued on page 183.)

A KNIGHT ON WHEELS.

CHAPTER XI.

THE car, which had been waiting for some such opportunity as this all morning, promptly mounted the footpath and charged a hedge. Fortunately it was climbing a hill on its first speed at the time, so the results of the impact were not serious.

Mr Mablethorpe, who was quite accustomed to mishaps of this kind, stopped his engine, and descended to earth to review the situation.

The first object which met his eye was Philip, a little blown and obviously taken by surprise, standing in the road with one hand still upon the Cape-cart hood.

'Hallo!' remarked Mr Mablethorpe genially.

'Still here?'

'Yes,' replied Philip. 'I thought I would run behind.'

'Better come and sit in front,' advised Mr Mablethorpe. 'But first of all we must get Boanerges out of the hedge.'

'Who?'

'Boanerges. Let me introduce you. I present Boanerges—my superb, four-seated, two cylinder, one dog-power reaping-machine—to—to—Mr'—

'Philip Meldrum.'

'To Mr Philip Meldrum. Now you know one another. At least, Boanerges knows you; you don't know Boanerges. Come and help to shove his ugly face in?'

Philip assisted his new and eccentric friend to pull Boanerges from the hedge and push him back into the roadway, and then obediently took his seat. He was trembling with pure ecstasy. He was in a motor-car! At last he had stepped from text-books into the realms of reality.

He surveyed the various appliances on the dingy dashboard. There were two switches of the electric-light variety, one marked M and the other A, which Philip knew stood for Magneto and Accumulator respectively. There was an oil-reservoir, with a piston-rod protruding from the top, and a glass gauge at one side to show the level of the oil. Last of all, suspended from its tail by a drawing-pin, came a clockwork mouse, which had originally been the property of the Dumpling, and was now spending its declining years as a motor-mascot. Meanwhile Mr Mablethorpe, with the assistance of the starting-handle, had been playing a monotonous and unmelodious tune upon his hurdy-gurdy-like engine. Presently he paused for breath.

Boanerges takes a lot of starting-up, he

explained. 'I'll have one more go, and if that fails we will run him backward down the hill and let the reverse in. That ought to do it.'

'Are you running on magneto or accumulator,

sir?' inquired Philip.

Mr Mablethorpe left the starting-handle and came thoughtfully round to the side of the car.

'I don't seem to be running on either,' he remarked. 'My mistake! Let us try this little fellow.' He turned down the switch marked A, and returned to his labours. The immediate result was a stunning explosion directly under Philip's feet. 'That is the first gun,' explained Mr Mablethorpe. 'He always gives us three before we start. The first is a protest; the second means, "Drop it, or there will be trouble!" and the third usually ushers in a conflagration. After that I blow the flames out, and off we go!'

But this was too sanguine an estimate. After five resounding backfires the engine still failed to exhibit any signs of abiding vitality, although the accumulator had been reinforced by the magneto. Mr Mablethorpe accordingly took his seat at the wheel, and, releasing the brakes, allowed the car to slide rapidly backward down the hill. At the same time he performed some

complicated evolutions with his feet.

Instantly the engine sprang into life, and Boanerges, with a playful swerve, shot stern foremost into a bank at the other side of the highway with a bump which nearly sent Philip back-somersaulting into the seat behind. The

engine immediately stopped again.

That resourceful but unconventional mechanic, the owner of the car, abandoned his pedal-work, descended once more into the road, and after dispassionately kicking Boanerges three times in the pit of his stomach—the radiator—seized the starting-handle and gave it another resolute twirl. This time his efforts were successful beyond all expectation. Boanerges promptly charged forward, nearly pinning his tormentor beneath his off front-wheel, and proceeded smartly up the hill once more, Mr Mablethorpe running frantically alongside and endeavouring to climb into the driver's seat over the spare wheel.

'Another little mistake of mine,' he panted, as he finally hopped on board and took the wobbly steering-wheel over from Philip. 'I left the gears in the first speed instead of the neutral. But it is all right now. We are off like an

Arab steed. Let me oil him up.'

He leaned forward and began to agitate the piston in the oil-reservoir, with the result that Boanerges, emitting dense fumes of black smoke from his exhaust, was soon breasting the slope with quite remarkable vigour.

'So you know something about motors?' said Mr Mablethorpe, as they reached the top of the hill and began to slide comfortably down the

other side.

'Only out of books,' said Philip. 'I have never been in a car before, but I think I understand the way the engine works, and the ignition.

Mr Mablethorpe surveyed him admiringly.

'Wonderful!' he said; 'wonderful! Fancy any human creature being able to understand text-books! They simply prostrate me. I dare say,' he added enviously, 'that you know what poppet-valves are! And worm-drives, and differential sprockets! Prodigious!'

'Only by what I have read about them in a

book,' explained Philip modestly.
'Well,' continued Mr Mablethorpe, 'I know of one thing you never read about in a book, and that was a car like this. Boanerges was built before the printing-press was invented-in the dark ages—in the days of the Black Art. at those two switches, marked M and A. They stand for Mephistopheles and Apollyon—the name of the firm who supplied the engine. Oh, it's an eerie vehicle, this! Observe this pedal, for instance. You wouldn't think a pedal could do more than just go up and down, would you?'

'It might take out the clutch, or put on the

brake, sir,' hazarded Philip respectfully.

Mr Mablethorpe waved his hand contemptu-

'That's nothing,' he said.—'Steady, old man!' This to Boanerges, who, feeling his owner's grip of the wheel relax, had swerved quite thirty degrees out of his course.—'This car was designed by a man without hands or arms—only feet and teeth. At least, I think so. His idea was to steer with his teeth and do everything else with So he started by abolishing gearhandles and side-brakes, and applied all his ingenuity to the pedals. Look at this one—the left. If I push it half-down the car stops. I push it two-thirds down the car starts again in the opposite direction, and the engine plays "I wish I was an Angel," instead of "Hitchy Koo!" We have a lot of fun in close traffic that way. If I push it seven-eighths down the radiator boils over, and I can have a shave or a cup of tea; and if I put it right down the car turns inside out and becomes a portable camp bedstead. I won't do that at present, because I am not sleepy.'

All this surprising information was communicated with an air of solemn and confidential conviction; and Philip, who had not previously encountered any one endowed with Mr Mablethorpe's peculiar brand of humour, merely gaped

dumbly.

'Yes, Boanerges is a car of mystery,' continued this excellent but frivolous man presently. 'There is a little handle-arrangement down here in the corner of the dash-board. I don't know who put it there; I just noticed it one day, after I had owned the car for some time. I have only turned it three times. The first time the whole of the back-axle dropped off into the road. The second time Boanerges turned right round and ran over a duck which was asleep on a cottage doorstep behind us. The third time a policeman with a note-book shot straight up out of the roadway in front of the car, and took my name and address for obstructing a funeral which had been trying to pass me for two hours. That was about seventeen years ago, just after I bought the car. At least, I didn't buy it; it was left to me by my great-grandmother. I have never meddled with that handle since.'

Philip, who had lived in serious company hitherto, and had no idea that grown-up people ever descended to imbecility of this description, began to like this strange gentleman. But he made no attempt to maintain a conversation with him. After the dictatorial austerity of Uncle Joseph, he felt pleasantly intoxicated by his present companion's frothy effervescence, and was well content to lean back in his seat and listen.

'Of course,' resumed Mr Mablethorpe presently, 'I may be wrong about the designer of this car having had no arms. He may have required them — one of them at any rate — for other For instance, he may have been purposes. engaged to be married. Are you engaged to be married, by any chance?'

'No,' said Philip.
'Ah!'

Mr Mablethorpe appeared to fall into a fresh train of thought, and after a little while inquired, 'What is your opinion of the female sex as a whole?

Not long ago Philip could have given his opinion on this subject clearly and concisely. Now he was content to quote the words of another. 'I don't quite know,' he said; 'but — He hesitated. Uncle Joseph thinks'-

Mr Mablethorpe might not be interested in Uncle Joseph. But this astonishing gentleman appeared to be interested in everybody. 'Tell me all that Uncle Joseph thinks,' he commanded.

'Uncle Joseph,' began Philip, 'used to wonder why women were ever created.

Mr Mablethorpe turned and regarded his small companion sharply.

'Aha! Uncle Joseph used to wonder that,

did he? Why?'

'He said,' continued Philip, warming to his subject as the familiar phrases came back to him, 'that there was no parallel to the female mind in any other branch of nature.'

'That is true,' remarked Mr Mablethorpe approvingly. 'I should like to meet Uncle

Joseph. Go on.'

'It seems incredible,' pursued Philip, with a curiously incongruous expression of intense wisdom upon his honest and ingenuous features, 'that Providence should handicap its own beautifully designed human engines by placing them in daily contact with such a piece of uncontrolled and ill-balanced mechanism as woman.'

'Oho!' said Mr Mablethorpe, manipulating the oil-pump, to the noisome satisfaction of Boanerges. 'Uncle Joseph said that, did he?'

'Yes; and he said putting women near a man was like putting a lot of bar-magnets round a compass. And he said they were parasites, too, actuated by predatory instincts. They'——

But Mr Mablethorpe interrupted him. 'Uncle Joseph, I take it,' he said, 'is a married man.'

'Oh no,' replied Philip; 'he is a bachelor. He never allows a woman into his house, even to wash; at least, he never did until the other day, when the Beautiful Lady came. And then—well, I didn't know what to think, sir,' he concluded helplessly.

'This,' commented Mr Mablethorpe, 'is elliptical but interesting. Proceed, my infant misogynist. Who was the Beautiful Lady, and

why did she call?'

Well, sir,' said Philip, knitting his brows, 'it was like this. No woman is ever—was ever—allowed into our house, because—because of what Uncle Joseph thinks—thought about them. Yesterday a lady called when he was out, and got in.'

'Who let her in?' inquired the accusing voice

of Mr Mablethorpe.

'I'm afraid I did, sir,' replied Philip apologetically.

'I am not in the least surprised to hear it,' said Mr Mablethorpe. 'What was she like?'

'She was all in black, and she sat and talked to me for a long time, and told me she had lost her little girl. Then Uncle Joseph came in, and —and—and they seemed to know each other quite well, sir.'

Mr Mablethorpe deliberately switched off his engine and slowed down to a stop at the roadside. 'Now we can talk without shouting,' he said. 'I scent copy. This is a real live Romance. Continue. How well did Uncle Joseph and the Beautiful Lady appear to know one another?'

'Pretty well,' faltered Philip, with boy-like

reserve

Mr Mablethorpe, who had once been a boy himself—there were some who said that he had never grown up—nodded understandingly. 'And what happened after that?' he asked.

'I ran away,' said Philip.

'Why!'

'They did not seem to need me any more,'

said Philip simply.

Mr Mablethorpe produced a pipe, and filled it with great care. He appeared to be thinking deeply about something. Presently, after lighting the pipe, he turned to Philip, and said, 'Are you in a pressing hurry to get to Coventry?'

Philip thought not, and said so.

'Then why not come and stay with me for a bit?' suggested this amazing man.

(Continued on page 181.)

THE CASE OF LORD SANQUHAR.

By H. G. Archer.

THREE hundred years ago London was startled by a cold-blooded murder committed in the heart of the City in open day. In the reign of James the First a well-known fencing-master named John Turner kept his school at the old Friary House, Whitefriars; and on the fine evening of 11th May 1612 he was atting at a tavern door near by. Here he was accosted by two strangers, to whom, after some conversation, he proffered refreshment. As Turner raised his glass to toast his prospective clients, as he thought, one of them drew a pistol from under his cloak and shot the fencing-master in the breast, and he fell dead instantly. The murderer and his companion took to their heels.

At that period the privileges of sanctuary still belonged to the precinct of Whitefriars; hence it was a favourite retreat of bullies, gamesters, thieves, and other outcasts of society, who, as a rule, poured forth by hundreds to defeat the ends of justice. But on this occasion the hue and cry summoned a mob intent upon apprehending the fugitives, whose garb proclaimed them to belong

to the hated race north of the Tweed. The influx of Scots who followed their king across the Border, and their bearing, which in the eyes of the English nobles savoured of presumption, created a feeling of racial antipathy which in process of time affected the minds of the common people as well. 'This nation,' as a contemporary writer expresses it, 'was being rooted up by those Caledonian boars.'

Carlyle, the assassin of Turner, managed to elude his pursuers in the labyrinths of 'Alsatia,' as the precinct was called; but the other man, named Irving, lost his way, ran into a cul-de-sac, and was captured by the watch, or rather rescued by them from the mob engaged in the congenial work of tearing a Scotsman in pieces.

When the news of the murder spread west, everybody at the Court appeared immediately to have suspected a Scotch peer, Lord Crichton of Sanquhar, of compassing the death of Turner. It was common knowledge that his lordship bore a bitter grudge against the fencing-master for the loss of one of his eyes whilst fencing with him

seven years previously. Crichton confirmed the universal belief of his guilt by withdrawing himself from public view. Hearing, however, that he was thought to have fled from London, and that a proclamation offering five hundred pounds for his apprehension was about to be issued, he surrendered on 14th May to Archbishop Abbot at Lambeth, declaring that he had had no part in the crime. Three days later Gilbert Gray, a Scotsman, was arrested at Harwich, when he was boarding a ship for Denmark, for complicity in the murder. Gray confessed that he had long ago been hired by Lord Crichton to kill Turner, but had given up the job in disgust. He had been Carlyle's first confederate, and he had only in this way abandoned the design two days

before it was actually executed.

Robert Crichton, sixth Baron Crichton of Sanquhar, was the head of a family which was ennobled in 1488, and had been of knightly rank from a much more distant date. The date of his birth is not known, but he must have been very young when he succeeded his father in 1570. As a youth a relative speaks of him as 'much given to idle voyages and gadding about.' On coming to man's estate he was a frequent offender against public order, and was often cited before the Privy Council on the complaint of his neighbours about his tyrannical conduct. In 1597 he was at feud with Thomas Kirkpatrick of Closeburn, whose servants were shamefully wounded by his agents. He also brought a charge of theft against one of Kirkpatrick's tenants, and usurped the king's princely power by having the man executed. His conduct was all the more reprehensible as he held the king's commission as Sheriff and Justiciary of Nithsdale. But though Crichton was a man of revengeful disposition, and subject to morose moods, there was another side to his character. He possessed high natural endowments, and also cultivation and refinement of manners, the latter the result of residence at Court and of foreign travel.

My lord was among the first of the Scottish expectants who followed James to his new kingdom. His unfortunate meeting with Turner occurred in 1605, when he was on a visit to Ricot, Oxfordshire, the seat of Lord Norris. There are two versions of the affair. One states that the peer, in a spirit of bravado, sought to give an exhibition of his skill at the expense of the maître d'armes, and pressed him so hard that Turner had no choice but to-make a pass at the upper part of Sanquhar's body, which resulted in his inadvertently piercing his adversary's eye. Sanquhar's own account is that he was a poor swordsman, and that he asked Turner to treat him as a novice—which implied that the master would spare the face of any one fencing with him. It is fairly evident, however, that Sanquhar's expressed belief that Turner had put out his eye on purpose did not begin to possess him till much later; but whether the obsession seized him before or after the following

incident, which first inspired him with the idea of taking mortal revenge, is a moot point. While he was on a visit to the Court of Henry of France, the king asked him how he lost his eye. He told him it was done with a sword; and the king sarcastically replied, 'Doth the man live?'

In February 1608 Lord Crichton was one of the twelve actors—the costumes costing each about three hundred pounds—at a splendid Court masque performed at the marriage of his friend Lord Haddington and the Lady Elizabeth Radcliffe, daughter of the Earl of Sussex. A few weeks later Sanquhar himself became a Benedict, espousing, on 10th April, Mary, the beautiful young daughter of Sir George Fermor, of Easton Neston, Northants. In March 1612 his lordship seems to have participated in one of the numerous broils of the period, leading to duels and murderous animosities between English and Scottish courtiers. The scene was Croydon horseraces, and the trouble arose through Lord Haddington switching the Earl of Pembroke over the face. Despite Pembroke's prowess in outdoor sports, he did not reply to the aggressor; but the English noblemen and gentry present responded to the challenge, and set to work to hustle all the Scottish visitors. Swords and daggers were unsheathed, and a battle-royal threatened. It was not the fault of a Surrey squire that this did not ensue. That gentleman was Mr John Pinchback; and although a married man, and having the perfect use of but two fingers, he rode about, dagger in hand, crying, 'Let us break our fast with them here, and dine with the rest at London!' Eventually harmony was restored, and 'there was nothing spilt but the reputation of a gentleman.' Pembroke's mother, the famous sister of Sir Philip Sidney, 'tore her hair at the report of her son's dishonour.'

Subsequent events, however, revealed the latter as both a bully and a turncoat. The quarrel at Croydon so inflamed the bad feeling between the English and Scots that the sensation caused by the murder of Turner seemed likely to end in vengeance being wreaked upon the Scots colony in the Metropolis. The king at once displayed great zeal for bringing everybody connected with the crime to justice, but his activities in this direction were evidently prompted more by terror than by any higher emotion. A reward of one hundred pounds for the capture of Carlyle procured his arrest in Scotland, whither he had made good his escape. The actual murderer was brought back to London under strong escort, extraordinary pains being taken that he should learn no lessons to stand mute. Of course, if he had refused to plead he would have suffered the terrible penalty of being pressed to death; but then he could not have been convicted, and in that case Sanquhar could not have been brought to trial as an accessory before the act.

Carlyle and Irving were tried at the Old Bailey on 23rd June, and being found guilty,

were hanged a day or so later on two gibbets set up at the Fleet Street end of the present Bouverie Street. Carlyle's gibbet was higher than the other, because he had some pretensions to gentle birth; though both convicts were described as 'yeomen' in the indictment.

Lord Crichton demanded to be tried in the court of the Lord High Steward, but his Scottish peerage was not held to entitle him to that advantage or honour in England. He was arraigned on 25th June in the court of the King's Bench by the name of Robert Crichton, Esq. The prisoner pleaded 'not guilty,' but that he did as a mere matter of form. At his trial he freely and fully admitted his authorship of the crime. He related how the French king's taunt was the beginning of a 'strange confusion in his working fancy, which neither time nor distance could compose;' and he described how he had tracked the poor fencing-master for several years with the intention of slaying him, till, wearying of the pursuit, he entrusted the foul work to hired assassins. Bacon, who replied for the Crown, said he must tell the prisoner plainly that he conceived he (Crichton) had sucked those affections of dwelling in malice rather out of Italy than out of any part of this island of England and Scotland. Sentence of death by hanging was then passed by Mr Justice Yelverton.

Turner was buried privately by the king's orders, so as to avoid an outburst of feeling; and now, in order to appease the great clamour and murmuring of the people demanding revenge, the execution of 'the Lord Zankor,' as he was called by the lower orders, was directed to be as public as possible. Great efforts, however, were made to save his life, including a written applica-tion from the Queen of France. But James was inexorable. It is said that the king had a private grudge against the condemned man. Crichton had on one occasion failed to resent an insult offered to His Majesty in Paris. At the French Court some one remarked that the English king was a second Solomon; and Henry the Fourth interjected, 'What! Solomon, the son of David [Rizzio]?' At which jeu d'esprit none laughed more heartily than the visitor from Scotland.

Sanquhar's execution took place in Great Palace Yard, Westminster, on 29th June. He was hanged on a gibbet with a silken halter, in deference to his rank, and the body was allowed to hang a longer time than usual to demonstrate to the spectators the king's greater justice. The corpse was taken down by Lords Roxburgh and Dingwall, who had it embalmed and sent to Scotland for interment. The dead man's clothes had to be redeemed at a great price from the hangman, to prevent their exhibition.

Lady Crichton behaved nobly to her husband during his last days. A week before his arrest she had divorced him; but she went to him while he was in prison, and took up his cause After his sentence, 'she sat very heartily. beside him, bathed in tears, yet sought by every affectionate word and act to strengthen him against the fear of death.'

As they had no children, the title passed to a Legally the family estates were forfeited to the Crown by the sixth lord's conviction for felony; but the new peer took peaceful possession of them, and was never disturbed in their enjoyment. Evidently King James considered that justice was fully satisfied, for in 1617 he honoured the seventh lord with a visit, on which occasion he handed his host a document confirming his right to the estates. His lordship is said to have used the paper as a torch to light His Majesty to bed. This Lord Crichton of Sanquhar was created Viscount Ayr, and in 1633 Earl of Dumfries.

To return to the sixth Baron Crichton. His conduct at the trial seems to have created a favourable impression in many quarters, so much so that, according to Sir Edward Coke, he became almost popular with the people; but there was a revulsion of feeling when, on the scaffold, he confessed himself a Roman Catholic. Coke speaks of the revengeful lord as 'a man of great courage and wit.' On the other hand, Chamberlain describes Sanquhar as 'a man nothing gracious among his own nation, and one who might well be spared;' while Archbishop Spottiswoode, a fellow-countryman, observes that his death was not much regretted by the Scots.

Lady Sanquhar is falsely reported to have married one Sands of Buckinghamshire six weeks after her husband's disgraceful death. matter of fact, she married, on 17th July 1615, Barnaby O'Brien, sixth Earl of Thomond, who was created Marquis of Billing by Charles the First; but the patent never passed. They had one son, who succeeded to the earldom. Lady Thomond survived her first husband sixty-three years, being buried on 13th April 1675 at Great

Billing, Northants.

PÈRE MUMBART.

'IF it was hard work taking up the previous sacks, it was nothing to what followed, for the others weighed quite thirty kilos each, and were full of meal. The cripple and Mumbart could only carry one at a time between them, and

it was nearly two in the morning ere the arduous task was finished and the wagon once more departed. With all the doors securely locked, the sacks were opened, gags removed, and then between twenty and thirty fresh country porkers

were running about testifying the pleasure of their new-found freedom by deep grunts, which became even louder and deeper when they had their meal from the pretty china washing-basins and enamelled foot-baths.

"Now," said Mumbart to the cripple, "go out on to the stairs. I will shut all the doors, while you listen if you can hear anything."

"No; it's all right," said the cripple, as his

uncle let him in again.

'After a good meal, they tried some of Bardar's wine and cigars. The arrangement was that Mumbart was to pay afterwards for what he drank and smoked, so Bardar had marked the price on each case and box, and a good price, too, as he had reckoned that his tenant would want something knocked off; but as Mumbart had not the slightest intention of ever paying for anything at all, he had disdained to haggle, and thereby rose considerably in his landlord's estimation.

'By the 19th September the Prussians had completed their iron circle round the doomed

'However much the locataires had been exercised by the arrival in their midst of the celebrated writer, they saw little or nothing of him; but they argued that a man engaged on a monumental work which was to go down to posterity was naturally busy, and so they thought little of it. If they had got up about six, they would have met the great writer and his nephew every morning carrying a couple of buckets smelling strongly of carbolic, which they emptied down the drain that took away the surface-water used for cleansing the streets.

'Used as he was to live en plein air, Mumbart was sorely tried by his sedentary life. he had many acquaintances in Paris, and he was always fearing that he might meet some of them. At seven, when in the early autumn it was only just light, he took a brisk walk for a couple of hours, usually up the Bois de Boulogne to see the hundreds of sheep and cattle tethered there, and as their numbers grew less the more pleasure it gave him as he thought of his pigs in

Bardar's recherché drawing-room.

'One day he had a great shock, for he unexpectedly met a couple of friends; but he got rid of them by asking them boldly if they had a room to let, as they had a case of virulent smallpox (petite vérole noir) at his own abode. After that rencontre he bought a large black beard and a pair of spectacles, and so well did this disguise succeed that he had the satisfaction of passing Didot on more than one occasion without the latter even giving him a second glance. Just as he went out in the morning, so when dusk came on his nephew took a stroll for an hour or two.

Thus the days went by, October passed, and Metz fell, and with it the last real hope of France; and then came November, when the cruel winter really set in, and the sufferings of

the poor became worse than ever. The terrible disasters of their country brought the little coterie of locataires even nearer together than before. Even the jovial Major became quieter. They used to meet in each other's rooms to condole with one another. They talked of the war; they talked of the weather-in fact, of almost everything; but there was one thing they never mentioned, and that was their own individual stock of provisions. Each had accumulated a secret store; but each made out, even in October, that they could not last another week. Major made jokes about rat and mouse traps, and even went so far as to buy a couple of them; but his pleasantries were not well received, as the locataires knew he had a lot of money which he had derived from the sacking of the Emperor of China's Summer Palace at Pekin, and that he used secretly to go and guzzle at the Café Anglais at least three times a week. Never seeing anything of Monsieur Losnay, as they called him, the *locataires* had almost forgotten his existence; but on more than one occasion some of them complained that the air at his end of the courtyard was not so fresh as it might be.

"Ma foi, quelle odeur /" exclaimed Madame Mardin, bringing out her handkerchief just opposite Mumbart's door as she descended the stairs one evening in the middle of December.

"Yes, it is frightful," replied her husband.
"I really think we ought to ask Monsieur Losnay about it," she said. "It's not the first time I have smelt it either. The other night, when we had that skinny old high pheasant I gave forty-five francs for, I had to open the window; but I was obliged to shut it again, as there was just the same horrible smell. I think you ought to see him."

"No, no, my dear," replied her husband. "You see, we are above him, and he would say at once that our drains were wrong; and we don't want any one prying about among our sacks of

flour and potatoes.'

'It was not only that the price of provisions had now reached an unheard-of figure, for cats were fetching eight francs and small dogs ten; but the gas had been cut off. The little that was made was kept for the balloons; so that everybody suffered from the terrible price of substitutes in the form of oil and candles; and to save them, rather than go to bed at dusk, the locataires came to an arrangement to meet at each other's salons, where they would talk and play cards round one small lamp or a single candle.

'Mumbart, as he sat with his nephew contentedly playing écarté, smoking, and drinking on Christmas Eve, little dreamt that his enterprise was destined to come to an end a week or two before he intended, all through one of these nightly causeries. In the ordinary way, the Major had looked forward to Christmas-time, especially to the réveillon, and would have gone to the Café Anglais every night to celebrate

the joyous time of the great festival; but he had caught a cold, and was just recovering from it.

'That evening they had all met at Madame Legrange's. As a great Christmas treat she had brought out a bottle of St Estephe, according to the label, but petit bleu as regards the quality. She even supplemented this with some eau sucrée. The Major thought, though he did not say so, that she was wise, for it was only by mixing the two together that the stuff could be

"Hark!" suddenly cried Madame Charbot. the wife of the organist, "voilà Josephine * qui

"No, I don't think it was, madame," said Monsieur Mardin, rising. "I think it was a rocket much nearer.—What do you think, Major ?"

"Well, it sounded out that way," he replied, going to the window, "and I think it was a gun." The room looked due north.

'Now, Mumbart's appartement at the end of the court was to the left. Familiarity breeds contempt. Every night, especially when he first came, though he opened the windows slightly at dusk, he had taken very good care to draw down the blinds and fasten the curtains very carefully; but, as bad luck would have it, the blinds had come down two or three days before, and he had not dared to get any one to repair them, so he had pinned the curtains. That evening, however, perhaps because the whole courtyard was dark, though they were drawn there was a space.

"Dites donc! what a bright light that man Losnay has!" said Monsieur Mardin, who was "Look! Why, I can see still at the window. him quite clearly, smoking and playing cards; but I can't see who is playing with him. Sainte

Vierge, he's got a dog in there!"

"A dog! Pas possible/" exclaimed the others, who had returned to the table, as they

had seen no rocket.

"I swear it," he continued. "It's a black one. I suppose he's going to have it as a bonne bouche for the jour de l'an. I think I shall call on him."

'Every one had come to the window by this time. The thought made their mouths water.

"There, can't you see it?" continued Mardin to Monsieur Legrange.

"Yes, I can see it," said the latter; "but it's a white one."

'This made them more excited than ever.

"Here, my dear, get my lorgnettes," Monsieur Legrange said to his wife.

"I can't see it," said Major Ledelle, who had

got on to a chair.

"Sacré bleu / Well, I never!" exclaimed Legrange very slowly, in an awe-struck tone. "I never did! I should never have believed it!"

"Believed what?" they cried, as he turned with the glasses in his hands, and whispered in an awe-struck voice, "Pigs! Holy Virgin, he's got pigs! Dozens of them!"

'For a moment his hearers were too dumfounded to speak, and before they could get over their astonishment the Major had almost

snatched the glasses from his hands.
"Good heavens, yes!" he cried.
"There's a black one, and now there's a white one; and, sapristi, there's an old one with a litter!" His hands trembled and his face had become purple

with agitation.

'This was too much for the organist, who, while every one was looking through the window, had surreptitiously been drinking the dregs of the claret out of the bottle, for he was so carried away by the news that he had upset a glass; but luckily for him no one paid the slightest heed. All took, in turn, a look through the glasses; and then, in a state of suppressed excitement, they looked at one another, each inwardly calculating how he might profit individually.

"Now," said Ledelle in a hushed voice when they were a little calmer, "we must hold a This must never go farther council of war.

than this room."

"No, this must not go any farther," they all

repeated in solemn tones.

"If it were known,' continued the Major, "thousands of the starving canaille would be in the courtyard. To-morrow morning at ten we will go and see him. We will tell him that we know everything, and give him to understand we will pay a fair price for some pork; but if he won't sell, then we will tell the authorities."

"Now I've got an idea," said Charbot the organist; "the plumbers who came last week have left a long ladder, and when Monsieur Losnay's light is out, I propose we put it up against his window and just see how many pigs

there are."

'Many of his hearers thought there was something in this; but the Major, who had his own plan, pooh-poohed it: firstly, because he had a cold, and did not want to mess about in the snow; secondly, because the noise of the ladder might put Losnay on the qui vive; and, thirdly, because—and the organist had to admit it-if the light was out, of course they could not see the pigs. The whole party was in such spirits at their discovery that their hostess brought out another bottle of wine; and while this was being opened Monsieur Mardin, who, with fascinated eyes, had been looking through the glasses again, suddenly told them that Losnay had put out his lamp; whereupon the wine was hastily drunk, and the guests took their departure, after all had again solemnly promised to keep their pledge of secrecy, and went to their several quarters.

"I've no faith, Henri," said Madame Mardin as she carefully placed her teeth in a tumbler.

^{*} This was the name of a great gun at the Fort St Ouen, which was as large as another called St Valerie at the Fort Valerien, the fort that Von Moltke was innocently shown over when he went to the Exposition in 1867.

"in that vieux serpent de Major. You'll see, he will try to make terms for himself. If he can only get two or three legs of pork out of that man below, he won't care in the least if we get none."

'But the ex-colonial governor could not be brought to believe that any one could be so base, and the two argued warmly for some time; but gradually her husband began to have his doubts

too, so eloquent did his wife become.

"Now, if this creature, with his disgusting pigs," continued madame, as she sat in front of the glass tying up her back-hair, "is really writing a book on China, it seems to me, Henri, with your vast experience of the East, that you might just as well go downstairs, now that all is quiet, and tell him you might be able to help him. Take a book with you, Les Fleurs de Chine or Histoire de Pekin, anything you like, just to get into the place."

"Really that's a most excellent idea, ma cherie," returned her husband, who began putting

on his clothes again.

"Now, dépêchez-vous," whispered madame, "or he will be asleep; mais allez doucement, très doucement. I will light you from the top of the stairs."

'Very quietly they opened the door; but as they did so they heard the door of the courtyard open and stealthy steps slowly mounting the stairs in the dark. Quickly they drew back, but kept the door ajar. Then the steps ceased at Mumbart's door beneath. A slight tap was given, but no notice was taken; then at intervals others, each getting louder.

"What do you want? Who are you?"

"I hear you are writing a book about China, and I've been there," said a voice which monsieur and madame at once recognised as the Major's, and significant glances were exchanged.

"I know all I require," replied Mumbart.
"I want," continued Ledelle in a loud

whisper, "to see you about a private affair." "You can go and be hanged!" was the curt

answer.

"Don't be too sure, mon vieux coq," cried Mumbart's visitor. "I know you've got pigs." "" You know too much," said the voice, "so

va-t'en au diable." And the inner door was

heard to slam.

"Did I not tell you so?" said madame, as they listened to the Major descending. "But hark!" she continued as the courtyard door was again opened quietly just as Ledelle had reached the bottom, so that he only had time to stand up against the wall as some one passed in the dark close to him. Breathlessly the Major waited, guessing at once, just as the Mardins did, that Mumbert's appartement was the magnet that drew the visitor, who felt his way cautiously up the stairs. Then there was another knock, and yet another a little louder, ere Mumbart was heard asking who he was and what he wanted.

"I've often heard you, or your nephew," said a voice (for the nephew was a fine pianist and sang well), "playing the piano. I am Monsieur Charbot, organist, and I thought you might like some music I have brought."

"I don't want it; we have plenty."

"I hear you are writing a book about China," continued Charbot, not to be daunted. "I had a cousin who went there, and I want to know if you ever met him."

"You and your cousin and your rubbishy music can go to the devil!" replied the voice.

"But I want to speak to you about a private You had better let me in, or you will regret it." But all the answer that the organist got was to hear the inner door slam again.

'Bursting with stifled laughter, not to say pleasure, as his own little manœuvre had not come off, the Major slipped quietly out without Charbot's being the least aware that the Major or the Mardins had heard him.

"Well, after that," said Mardin sadly, as he gave his wife back the pretty books, "I sha'n't

try."

'Thus it came to pass that in three appartements there were muttered swearing and regrets. for the outlook on the morrow did not seem quite so rosy as the occupants had anticipated. But it was quite otherwise with the Legranges. Fully half the night was spent by them in speculating on the amount of pork they would get, and the beautiful gravy it would make. Two of their treasured apples, they determined, should be used for the sauce; and when at length they went to sleep, they dreamt of pigs and crackling.

'At ten the next morning all the men met. Somehow there was not quite that open, gushing cordiality that they had shown on the previous night. There was a bright spot on the Major's nose—always a sign of irritability.

"Now, as regards that scamp," the Major said

brusquely, "we will stand no nonsense."

"You are quite right, Major," said Charbot

warmly; "we must be firm."

'Legrange, in his innocence, knowing nothing of their nocturnal visits, was quite taken aback by their vehemence.

"Mais, messieurs," he said gently, "you must remember we have to deal with a very distinguished man, a man of culture, with a great reputation, a celebrated writer "-

"Bah!" interposed Ledelle, "that's tout-àfait blague. I don't believe he knows China from Peru. I want some pork, and I mean to have it. Allons /"

'So the four men set off. There was a sharp knock at Mumbart's door. No notice was taken of it. The knock was followed by a loud kick.

"He's coming," said Charbot, who had been looking through the keyhole, and now stood back.

"Are you the gentleman," said a voice, "who kindly came last night to tell me about China?"

"What on earth does he mean?" asked

"I don't understand it," said Mardin, in

simulated surprise.

"Bah! he's drunk," said the Major. "Yes, of course he is," said Charbot.

"We know you have got pigs in there; so open the door, I say, or we will go for a gardien," said Ledelle.

"Well," replied the voice, "I tell you now what I told you last night-you can all go and

hang yourselves."

'So the whole party—cursing and swearing, with the exception of Legrange, who was quite mystified, and wanted to know what was meant by the allusions to last night's visits—went down vowing vengeance. After a short consultation. as Ledelle had a cold, Charbot went out to find an agent.* In about ten minutes he returned, and with him was a tall, thin, poor, half-starved individual, with a pale face and a red nose. Charbot and the man had hardly mounted the stairs, when the concierge flew up to Mumbart's room, gave three sharp taps, put a piece of paper under the door, and hurried back.

"One at a time, messieurs," said the gardien, producing his note-book. "Who is going to

make the accusation?"

"All of us," they cried.

"No; one will do." So it was agreed that it should be in the Major's name.

"Ledelle, Achille, Major en retraite, deuxième

Régiment d'Artillerie."

"Bon /" said the gardien. "Now, what is the accusation?"

"He has got pigs in his appartement," said Ledelle.

"Pigs!" exclaimed the astonished man.
"Pigs! Pas possible!" But they all clamoured round him and swore to it. Licking his pencil with avidity, he wrote it down. "Allons!" with avidity, he wrote it down.

he said, closing his book.

"Not so fast, my friend," said the Major. "Taking one thing with another, it seems to us that we had better keep the affair to ourselves. If he likes to give us, including yourself, two kilos each-shall we say i-three times a week, there will be no need to make a fuss about it; but if it gets abroad, probably neither you nor we shall get any. Vous comprenez, mon ami?" he continued, with a wink.

"Si, si, je comprends bien," said the agent hurriedly; "mais, allons, I want some pork."

"So do we," they cried, and once more they set off for Mumbart's rooms.

'There was a loud knock, which brought from Mumbart the usual inquiry.

"Je suis Agent Drax. Open, in the name of the Law," answered the gardien in a deep voice.

'The door was at once opened, but the chain was up, and the group saw Mumbart with a pistol in his hand. "Enter, agent," he said, taking down the chain; "but I will shoot any one else who tries to enter."

'Charbot, who was nearest, had hastily drawn back, partly because of the terrible smell that came from the inside, and partly at the sight of the

weapon. Drax went in, and the door closed.
""We have got him," cried the Major triumphantly, and in high spirits they congratulated each other. But the time went by, and they looked at their watches. Charbot glued his ear to the door, and swore he could hear the pigs.

"Yes," he exclaimed; "it's like a lot of

Germans in a Bier Halle."

'More than an hour went by, and most of them were seated on the stairs. Suddenly the door opened, and, almost pushed from behind, the agent appeared, and the door was shut. His face was flushed; his nose shone like a lantern. With bulging pockets, he stood irresolute for a moment, and then he made a dart for the bannisters and held on firmly.

"What arrangement have you made?"
"What's he going to do?" "What are we going to get?" were some of the excited questions that were demanded. With a glassy eye and an imbecile grin on his face, the agent placed his finger to the side of his nose and solemnly winked.

"You're drunk, you brute!" cried the Major angrily. "I will report you. Do you hear that? Tell us, what did he say?"

'The agent tried to pull himself together. "Affaire sh-sh-shérrieuse. Affaire sh-shérrieuse," he replied in a thick voice.

"Yes, it will be for you," said the irate

"No humbug! Tell us what is going to be done," said Charbot.

'" Je vais voir le commissaire; je vais chercher mon supérieur."

"Well, go, then," they said.

'But Agent Drax was in no hurry, and he would not let go the banisters for some time. Then, still clutching them, he went downstairs backwards, burst through the door, and went zigzagging across the courtyard, where the concierge, seeing the state he was in, took charge of him. It was with difficulty that the others restrained Charbot from going to fetch another agent, and got him to understand that the less that was known about the pigs the more pork there would be to divide among themselves. While the agent was sleeping off his carouse the locataires held another council. They had been completely foiled hitherto, and it began to dawn on them that they might be defeated altogether if they did not take care.

"Depend upon it," said the Major, "if that commissaire de police gets into Losnay's rooms without our knowledge, that coquin will square him. Every man has his price; we

^{*} After the 4th of September the police duties were undertaken by the Garde Nationale; but a few of the regular police were retained, and wore the uniform of the former.

must see what a couple of louis will do with the concierge."

'This seemed sensible; so they gave ten francs each, and the Major saw him; and as the jour de l'an was approaching, when he became more tractable than usual, the concierge, for cash down,

agreed to let them know of the man's arrival. However, to make doubly sure, the *locataires* determined to keep watch themselves; so they placed an arm-chair on the landing above, outside of Mardin's room.

FOREST DWELLERS.

By JAMES DRUMMOND, F.L.S., F.Z.S.

IN an immense gorge in the heart of the Urewera country, the last part of New Zealand to come under the influence of civilisation, there stands a little cottage, built partly of canvas and partly of rough planks and shingles hewn out of trees that grew close by. It is old and weather-beaten. Rose-trees sprawl along the uneven fence; honeysuckle climbs up one of the walls; a weeping-willow grows in front; and behind, up the slopes of the hill, there are apple, plum, and peach trees. In front of the cottage there is a road that has opened up the fastnesses of this wild and beautiful region. At the bottom of the gorge, the Hei-pipi day and night sings a gentle song as it trips over stumps and boulders on its way to the sea, where it becomes the mighty Whakatane River. Mountains covered with gigantic trees and an extraordinary wealth of undergrowth rise up on all sides; but on the north there is a dip, through which the sun strikes the cottage and lights up its tiny windows. Telegraph and telephone wires do not run in this district, newspapers do not circulate in it, time does not count, and the hills do not send back the faintest echo of industrial activity.

The cottage, in fact, is in one of the most secluded and romantic places in the wide world; and there Paitini and his wife Margaret live the simplest of simple lives, and pass their declining days in peace and happiness. They have few needs, which are easily supplied. In the shooting season, Paitini slings his gun over his shoulder and goes out into the forests to shoot woodpigeons, which Margaret cooks to perfection. At other seasons he catches native trout—the sluggish kokopu—with nets made by Margaret's own hands on patterns handed down from generation to generation by honoured ancestors. There are also hinau and tawa berries, mashed and mixed with honey; fern-root cake, flavoured with the sweet juice of the tutu, squeezed out of the plant's poisonous berries; potatoes; wild strawberries, which were planted by the thoughtful missionaries some seventy years ago, and which have spread up hill and down dale; the flesh of vegetarian pigs; and some of the white man's staple foods.

Paitini belongs to the Tuhoe people, forestdwelling Maori tribes who occupy the Urewera country, and who are well versed in the ancient forest lore; and he consented to instruct me in the old methods of snaring birds taught to him in his boyhood, long before seventy years had bent his shoulders and bleached his hair. When I shook hands with him he wore a blue flannel shirt, blue dungaree trousers, and a red woollen scarf round his waist. A red flannel jersey showed up on his chest where the shirt had been thrown open at the neck. He wore neither hat nor boots.

Just before we passed into the forests to search for birds he swept the skyline with his hand, and said in broken English, 'All my land—ten tousand acre.' I asked this strange and picturesque overlord of thousands of the best broad acres in New Zealand why he did not make some use of them. He replied that he would gladly sell them if the Government would allow him to do so; but as for using the land for cattle or sheep, or cultivating it after the methods of Europeans, he was far too old and too contented with his present circumstances to contemplate incurring responsibilities and worries in that way.

As we roamed the forests, following tracks invisible to any eyes except his own, he occasionally muttered to himself chants and sayings of old times. Civilisation has taken a strong grip of him, but he stands only half-way between the old order and the new. In religion he follows 'Hau-hauism,' a strange intermingling of ideas, based largely on the Old Testament. He treasures many old customs, and he refuses to relinquish beliefs which were very real to him when he, a young toa, went forth under Rewi-Maniapoto and Te Kooti to chase the hated white men back into the sea. He told me that Tane is still god of the forests in Tuhoeland, and that all the trees, birds, and insects are that deity's children; Tangaroa is lord of the waters, Rangi and Papa are heaven and earth, and Maui fished New Zealand out of the sea, and very nearly succeeded in wresting immortality for man from the Great Lady of the Night. He assured me that in Tuhoeland, where these and other gods hold their sway, it is not advisable foolishly to offend them by neglecting ancient rites and practices.

When the mists began to creep down the mountains, and purple shadows were cast on the distant slopes, and Tane's giant children took

gaunt and unnatural shapes, we returned to the cottage near the road, where Margaret had prepared a bush dinner of wood-pigeons and potatoes, set out on a small table in her kitchen. The room is about ten feet long and six feet wide. The fireplace is almost as large as the room itself. Chains hanging from a heavy cross-bar support kettle and pots over the burning firewood, and on each side there are great hobs. One of the walls is furnished with shelves and racks, which hold rows of plates, cups, and saucers, probably a present from a European friend. It is a compact little kitchen; and it is as scrupulously clean and tidy as if old Margaret kept a regiment of domestic helps to attend to her household work.

After dinner, Paitini, Margaret, and three little Maori girls they have adopted gathered together in the room allotted to me as bedroom and sitting-room. It is a box somewhat smaller than the kitchen. The furniture consists of a table three feet square, a low bed, and shelves, and there is matting on the floor. A log sparkling in the large fireplace lit up the room and the faces of the group of Maoris, and kept out the biting cold of the frosty night. Stretched full length in front of the fire, Paitini told me the story of Rewi-Maniapoto's defence at the Orakau fort forty-seven years ago, when the rebel Maoris, asked by General Cameron's messenger to cease fighting and to surrender, in order that their lives might be spared, shouted back the defiant answer, 'Friend, we will fight against you for ever! for ever!' Four years later Paitini was present at the less heroic Mohaka affair, on the east coast, with Te Kooti as his leader; and later still both he and Margaret were with the armed tribesmen who tried to stop the soldiers' advance into jealously guarded Tuhoeland, the Maoris' last stronghold.

'But enough of this,' he said; 'it is finished. The fighting was good while it lasted; the white men fought very bravely, but not always fairly, and we are all at peace now.' He then recited some of the songs and sayings of the old days. One is the song of the parasitical shining-cuckoo and the long-tailed cuckoo, which place their eggs in the nests of the whitehead and other small native birds, and leave the foster-parents to hatch the young. The words of the song are:

'Oh son, who sleepest there, awake and arise! When strangers ask, "Whose child is this?" swift be your answer, "I am the offspring of the shining-cuckoo, of the long-tailed cuckoo, left for the whitehead to cherish."'

He recited a lament composed by an old Maori woman when all her children were scattered, and she was left alone and friendless. Into it she introduced a reference to the belief, still held by Paitini, that the kiwi bird lays its eggs in holes under the roots of the fagus tree, covers them with leaves, and allows them to hatch out the best way they can—a process which takes so long, he said, that the roots of the tree sometimes grow large enough to block up the hole before the eggs are hatched! In expressing the deep feelings of her heart, she compared her children to the titi, the black petrels, which fly at night from the sea to their haunts in the mountains, and herself to the kiwi's egg: 'The wailing titi fly onward and alight in pairs; but I, oh bird, am like the kiwi egg, left under a tawai tree; and this, when hatched, will be my only offspring.

The old man dismissed his womenfolk with a wave of his hand. As they opened the cottage door to go to their own hut, some twenty yards away, they cried out loudly to frighten the evil spirits who still come about at night in Tuhoeland, and I heard them run for their lives in case they should be seized by invisible hands.

Paitini took off his coat and made a pillow of it; he wrapped himself up in a fourfold blanket, curled himself up on the hard floor close to the fire, and immediately fell asleep. On turning down the blankets on my bed, I saw on the white pillow-case, done neatly in needlework by a skilful hand, the letters, 'E moe kia kaha,' an invitation to 'Sleep strongly,' which was not wasted. My slumber was broken only once, shortly after midnight, when I awoke to find Paitini piling wood on the fire. The disadvantage of the ordinary fire, he explained, is that, while it roasts one side of a man, the other side might be almost frozen; and he suggested that it would be a good thing to have a fire which would keep both sides warm at the same time. He had hardly concluded this wise remark before he was fast asleep again, the happiest and most contented man in New Zealand.

WHAT IS THE WORLD'S MOST FAMOUS SONG?

By GEORGE A. WADE.

You have sung it many a time, but will say you've never heard it when first you read this.

THERE cannot be the least doubt whatever that the most famous song in the world, judged by its being known in the most lands and by the most varied nations, and by its being one of the oldest and most widely sung ditties

ever known, is that which has for its first line, 'Malbrough s'en va-t-en guerre;' which, if we were to give the English version of it, instead of the older French words, would be, 'Marlborough goes away to the war.'

But you say, 'That the most famous song in the world! Why, we must be dreaming! We

never even heard of it! What about our grand old "Home, Sweet Home"? What about "God save the King"? What about "Auld Langsyne"? And what about the "Marseillaise"? Why, we've known and sung these all our lives, so to speak, and they are heard in every country; whereas that song you've just mentioned—bless us, we don't even know the first line of it!'

Yes, it does sound funny, doesn't it? But wait till you've read this; then we'll see what you say! There can be no doubt that if you took any hundred people in England, and asked them which was the most famous and bestknown song in the world, they would all select one of the four you yourself spoke of just now. The Scotsman would swear by 'Auld Langsyne,' and would have some good reason on his side; the Englishman would probably go solid for 'Home, Sweet Home,' finding the Scotsman willing to put that second; the Frenchman would plump for the 'Marseillaise;' whilst both the English and the Scots would acknowledge that the great French song might well claim high place. But nobody, not a single man out of all the hundred, unless he were a specially knowing person, would ever venture to suggest that 'Malbrough' was the most famous, the most widely known, the most often sung, and had by far the most glorious traditions amongst all the songs of the world's many and varied countries. Yet it unquestionably is so; and that you've acknowledged yourself many a time, though you've not known it! Yes, you have! For, I repeat again, there has never been such a popular song as 'Malbrook,' and you yourself have agreed to this often and often when you have sung so enthusiastically and heartily the song's splendid refrain:

> For he's a jolly good fellow, For he's a jolly good fellow, For he's a jolly good fellow, And so say all of us!

Let me give you the history—a perfect romance in itself-of this wonderful song, which has gone into almost every civilised spot in the world; which is sung by Arabs in the Sahara, by wild Turks on Asiatic steppes, by Britons in every clime at festal gatherings, by vivacious Frenchmen on every continent, by Hindus swarming on 'India's coral strand,' by trappers on the bleak icy plains of Labrador. Hear how it was chanted by the brave Crusaders as they marched to fight for the Holy Sepulchre seven centuries ago; how it was crooned by queens and nurses during the palmy days of the grand empire of Louis; how it rang out amid the wild orgies of the French Revolution; how it is shouted with glee wherever Englishmen or Scotsmen gather to-day to greet with enthusiasm the hero or the true man!

The gallant Crusaders, when they returned from their wars for the Holy Sepulchre in the

thirteenth century, brought back with them to France a tune which they had learned afar. They sang it and hummed it as they marched, till it caught the nation's fancy, and became at last one of the songs of France, whence it soon crossed the Channel and delighted the English. Where the Crusaders actually got the song is a matter of much doubt. But, as the Arabs of Palestine knew the song well, and were often heard singing it by Chateaubriand and others, it is not improbable that the Crusaders actually learned it from their enemies when fighting the Saracens. This theory is negatived, however, by many high authorities, who suggest that the true air and the best-known words of the song, as we have it to-day, unquestionably come from the period when Louis the Fifteenth sat on the throne of France.

In any case, we are entirely on safe ground when we come to the days which saw our own Duke of Marlborough going to fight the French in Flanders during the reign of Queen Anne. For then the French, who had for centuries, as we have seen, sung this song beginning 'Mabrook s'en va-t-en guerre,' made an easy change of a word in the first line, and so hit off the situation to a nicety.

Let us explain here that the original word 'Mabrook' did not refer to the Duke of Marlborough at all; it was the name used in the song for generations previously. Now 'Mabrook' itself is an Arab name, and this would seem to afford strong proof that the famous song originally came from the men who during the great Crusades fought (under the name of Saracens) against our own kings, and who to-day travel over the wide deserts.

By a clever thought the French altered 'Mabrook' to 'Marlborough' about the time of Malplaquet, and so made the song tell how our great Duke set out to the war, but returned not; how his lady went to the top of the tower to watch for him, but saw not his banners; how at last a page came, announcing that the Duke had been killed and buried. All this was like the theme of the original song as brought from the East by the Crusaders, and you will see how exactly it fitted in with what the French now wished might happen to Marlborough, and how neatly his name was substituted.

Now the paraphrase of this French version runs freely as follows, with regard to the first verse, to which a special chorus was added from an unknown source. But this chorus became immediately a tremendous success with the French. Thus the song went:

> Marlborough, prince of commanders, Has gone to the war in Flanders; His fame is like Alexander's; But when will he come home?

> > He won't come home till morning, He won't come home till morning, He won't come home till morning, Till daylight doth appear!

This was the French version of the song. But by this time the fine air and parodies of the words had become known to many in England, and they saw that the 'He won't come home till morning' was the wish which was father to the thought, as we say. So in derision they themselves retorted with another chorus, which made the great song run:

Marlborough, prince of commanders, Has conquered the French in Flanders; His fame is like Alexander's; And he's the best of all.

> For he's a jolly good fellow, He's a jolly good fellow, He's a jolly good fellow, And so say all of us!

It was thus, then, that the greatest song in the world took on more or less of its present form. To-day the verses of the song are unknown to most ordinary folk, because, having little or no topical relation to present things, they have long been passed by in ignorance or forgetfulness. But who doesn't know and hasn't yelled out the chorus thousands of times? And, mark this, that same air and chorus are to-day just as popular in nearly every other land where Britons and Frenchmen gather, in every country which the Arab traverses, as they are in our own, with, of course, several variations of words to suit the There cannot be the slightest spot and time. question that this is the song which is the best known and most widely sung throughout the whole world in this year of grace 1914.

One cannot leave the subject, however, without recalling the marvellous list of illustrious names directly connected with this glorious song. Just think of them for a minute! Marie Antoinette sang it as a cradle-song to her babies; the famous musician Beaumarchais introduced it into his Marriage of Figaro in 1784; Beethoven used it in his well-known 'Battle Symphony' in 1813, as emblematic of the march of the French army under Bonaparte! Napoleon held it in special favour, and was heard singing it to himself as his army crossed the river Niemen on its way to Russia in 1812; whilst at St Helena, not long before his death, he remarked to one of his old friends, 'What a great man that Duke of Marlborough was! What a thing is ridicule; it even attacks the victor!' And a moment later, almost with death right in front of him, the great 'Scourge of Europe' began to sing softly, 'Marlborough s'en va-t-en guerre.' It was a magnificent tribute in itself to the hold this wonderful song has had over so many of the world's greatest and most illustrious men.

Messieurs Siraudin, Bizet, and others brought out this song in an opera-bouffe at the Athénée, in four acts, about 1867; and Barras sang it much farther back than that. Even more famous was the immortal Charlotte Corday, who often chanted its strains; whilst Queen Hortense made it the foundation of her famous tune, 'Partant

pour la Syrie,' and the noble poet André Chénier also based his 'Mourir pour la Patrie' on the song. Curiously, too, the Finns to-day sing words to a tune identically the same; and Helberg, at the Copenhagen theatre in 1826, won immense applause by introducing the song, in which all the dames joined with much fervour.

Now will you deny that 'Malbrook' is the most popular song the world has ever had or known? No other song has ever approached its fame, glory, and popularity with every nation that has heard it or known it! The verses may be forgotten, but the chorus is immortal, whether we vary it, as in Britain, with 'We won't go home till morning!' and 'For he's a jolly good fellow!' or whether we sing, like the French, 'But when will he come home?' or whether we join the Arabs in their favourite strains of 'Woo-ela metta yerja-ya lail.'

The splendid song, the inspiring words, the magnificent lilt and simplicity of the tune, fairly hit you in the eye, as the Americans say. And in honour of hero, king, friend, true man, indeed any one who distinguishes himself in what is brave, manly, and noble, every Briton, every Frenchman, every Arab, every Finn, every Dane, every Turk, every American will join enthusiastically in the immortal chorus of

For he's a jolly good fellow, For he's a jolly good fellow, For he's a jolly good fellow, And so say all of us!

CLEOPATRA.

THE long, low light across the Nile
Athwart the barge's purple gleamed,
Where, proud, with slow, luxurious smile,
The Queen of Egypt dreamed.

Gems glittered 'mid her dusky hair, On the white wonder of her arms; Great Orient's treasures rich and rare Crowned Cleopatra's charms.

Splendid, magnificent, she leaned;
Voluptuously her velvet eyes,
'Neath languorous lashes softly screened,
Flashed to the radiant skies.

The amber hues of saffron sands
And sun-kissed waters shrined her, while
Her barge to dim and distant lands
Slipped smoothly down the Nile.

To that last port of human call, Regal, she drifted, grand, serene; While darkness folded as a pall Egypt's imperious Queen.

And as her barge steered far apart,
And purple shadows darkly fell,
The asp warm on her pulsing heart,
She waved her proud farewell.
MARY M. CURCHOD (MYRA).

ALGIERS.

THE AMERICAN LOYALISTS: THE FOUNDERS OF BRITISH CANADA.

By A. G. BRADLEY, Author of The Making of Canada, Britain Beyond the Seas, &c.

BRITISH CANADA is so intimately associated in the public mind with material prosperity, acquired by the hard, peaceful toil of successive waves of British immigration, that the origin and character of its founders are utterly lost sight of in this country. I am sometimes tempted to think that they are forgotten by the Canadians themselves! How many British people, at any rate, realise that this was a military colony, born of sentiment and bloody war, and nurtured in physical tribulation; that its founders and creators were not people from these islands at all, but Americans; and that for half-a-century after its acquisition from the French its British-born element hardly counted? From the conquest (1760), associated in most minds with Wolfe's glorious victory on the Plains of Abraham in 1759. till the revolt of the American colonies, Canada was governed by our viceroys mainly with a view to the welfare and loyalty of the French population. Save for a few Anglo-American traders in Quebec and Montreal, and the British officials and garrison, there were no British in the colony. Nobody at that day-and with good reason-foresaw an immigration from British America, much less from Britain.

The government was paternal, the laws and land tenure of the French of a semi-feudal kind, and the Roman Catholic Church was established. The country was regarded by Americans as arctic in climate and barren in character, and its institutions impossible for the alien settler. In Great Britain it was not regarded at all except for its strategic value and martial associations, and by politicians as a field for controversy in the methods of governing a remote community of transatlantic Frenchmen. But the revolt of the American colonies, during which they very nearly captured Canada, changed all this, and like a bolt from the blue the whole situation in North America, Canada included, was utterly changed. This isolated little French nation, which we were to govern paternally very much after its own ideas, and keep it loyal, till kingdom come, was suddenly thrown into the melting-pot, very much to its own disgust. For, on the whole, it liked our governors and soldiers, but hated with the traditional hatred of ancient enemies its British neighbours south of the St Lawrence. It was now to be forced by circumstances into civic partnership with them—the Ultramontane, feudal-minded, ignorant French-Canadian yoked to the Protestant, liberty-loving, politically minded, arrogant Anglo-American! And this, of course, is how it came about.

At the close of the American war the British Commander-in-Chief at New York, the same Guy Carleton who seven years before, as Governor of Canada, had saved it, found himself with thousands of ruined American Loyalists upon his hands, of whom all the able-bodied males had fought through the war in the irregular regiments raised by the Crown. They had now no foothold left but the British camps at two or three seaports; and when peace was declared, New York alone was temporarily retained by the British forces. At the evacuation of Philadelphia, Charlestown, and Savannah, thousands of Loyalists had left the country for Florida, the West Indies, or England, in most cases virtually destitute of present means or future prospects. At the peace, early in 1783, Carleton had some forty thousand on his hands at New York; but before following the destiny of these unfortunate people, a word must be said of the causes which brought them to such a pass.

The old school-book notions of 'tyranny' as applied to King George's dealings with the colonists have long been laughed out of court by modern American historians. It was really a very intricate constitutional question, with about as much right and equity on one side as on the other. It is enough to say here that when the more violent spirits roused the mobs, the mass of the thinking classes found themselves compelled to take one side or the other. Safety, selfinterest, kinship, and a score of similar motives influenced men in making a decision they would gladly have postponed, often perhaps indefinitely. Once sides were taken, intolerance and persecution on the part of the rank and file of the revolutionists sprang up almost at once, and grew by degrees into ferocity as the war proceeded. In most districts it was much easier and safer to declare for the patriot side. To hold by the British connection usually demanded from the

No. 169. - Vol. IV.

FEBRUARY 21, 1914.

first a stouter heart and a greater courage of opinions; for it meant infinite petty persecution to both sexes, often unblushing robbery of goods and lands, sometimes physical violence, and occasionally death; the better people among the patriots being either at the front or impotent as a restraining force. When, in the varying fortunes of the war, the Loyalists had a chance, they retaliated in kind. The net result was that at the close of hostilities the Loyalists, or 'Tories,' were regarded as irrevocable outcasts. In spite of every effort, no terms could be procured for them by the British Government. The French, whose assistance had secured the victory, interceded for them, but were told to mind their own business. Confiscation of land and goods was the official, expatriation the social, verdict of every colony. This seems a strange judgment for a free and enlightened people to pass on fellow-countrymen who had merely fought for the ancient allegiance of the country on a purely constitutional question not raised by themselves. Nor does any sane American to-day attempt to defend it. Indeed, the Americans, for practical reasons, had bitter cause to regret it. It was forty thousand of these expatriated people who founded British Canada, not English and Scottish immigrants, and the feelings toward the American Republic that they carried into the wild woods of the north may be readily imagined. yet it accounts for many things in Canada that British visitors cannot well understand. There they were, however, in 1782-83, these homeless victims of a lost cause, huddled in New York, and mainly destitute. General Carleton wrote home that it made his heart bleed to see these people, 'including great numbers of the very first families in the various colonies, born to the fairest possessions,' who had lost their all in the king's service, and had nothing in the world but the half-pay granted to the officers and some trifling pensions to the widows.

It was, in truth, a critical and heart-rending situation; and there was only one way out of it—namely, to convey the refugees to some unoccupied country within the dominions of the Crown, and in due course—for such a measure, with the best intentions, was full of intricate detail—to vote

them a money compensation.

Nova Scotia, then including what became later New Brunswick and Prince Edward Island, though British territory for the past seventy years, only contained some fourteen thousand more or less British people and three or four thousand French Acadians, these latter the remnant of the famous deportation of 1755, with Halifax as the seat of Government. But nearly all this vast region was a howling wilderness covered with dense timber, and it was now offered as a home of refuge to all Loyalist exiles who were willing to go there. Nearly all were willing, for they had no alternative except Upper Canada (Ontario), and the choice, as it may well have

seemed to these people, was merely one of two evils. Almost concurrently Upper Canada had been for the first time realised as a possible place of settlement. But of this anon.

In the meantime some thirty thousand of General Carleton's refugees at New York decided for Nova Scotia. During the lull before the peace, and the whole summer following it, prior to the military evacuation in 1783, ship after ship loaded with these unfortunate people and the miserable remnant of their personal effects sailed for the then inhospitable shores of old Acadia. 'Hell or Halifax,' in the catchword of the day, tersely expressed the Loyalist prospect. The Crown surveyors had already been busy. Tracts of wild forest land were apportioned in extent according to military rank, for most had become soldiers, and to others upon a somewhat similar scale. To find enough vessels for such a throng of people, the average capacity of those available being under a hundred tons, was a cause of infinite labour to Carleton. He postponed the military evacuation again and again, notwithstanding the protests of the Republican Congress, stoutly declaring that he would not ship a soldier till the last Loyalist had been removed. A few of the latter had tried the experiment of returning to the neighbourhood of their despoiled homes, but found the vindictive passions of the hour too strong for endurance.

Washington and other leaders had denounced this unworthy attitude, and Congress had given utterance to well-meaning platitudes; but each state was a separate autonomy, for federal government, weak in such matters as it still

is, was not yet.

The dumping of these forlorn shiploads into the woods of Nova Scotia is as tragic a tale as British history has to tell, and few events have been more fruitful of results. There are none of which the average Briton is so deplorably ignorant; though, thanks to Longfellow's misleading poem, 'Evangeline,' two or three generations have wept over the numerically trifling expatriation of rude Acadian peasants, who, in the teeth of repeated warnings, had persistently refused the oath of allegiance. This Loyalist exodus was altogether another business. The only fault of these capable and highly civilised exiles lay in having fought for a Government that they and their fathers had immemorially lived under and sworn to obey. Their judgment may have been right or wrong, but their principles were above reproach. They came from all the provinces-New England, New York, the Jerseys, Virginia, and the Carolinas. We have a list of the principal people among them, and who they severally were, which of itself fills an octavo volume. Judges, clergymen, professors, country gentlemen, planters, lawyers, and substantial merchants make up the roll; though most of them by now were soldiers too, and of several years' hard service.

Government had done all that it could for the

moment, under the great transport difficulties of those early days. Besides the forest lands allotted to them, the exiles were to receive farm implements and rations for two years. Even this poor provision—owing to the usual contract blunders. or worse, and lack of precedent for so great and distant an undertaking—was miserably deficient. A large number of clap-board houses had been run up at one or two points on the coast for some, and the little town of Halifax afforded a temporary shelter for others. But such makeshifts were of little use to thousands of refugees who in the main had to disperse over a region as large as Ireland, and hew a hard living out of dense forests; this, too, in a country which was under snow for nearly half the year! It would have been a severe test for a rude peasantry with no past to regret, and such future as they might carve out a clear gain; but all of these people, in their different degrees, had left home, comfort, and prospects behind them, and, stripped of everything, stood between a cold and often foggy sea and a forest-covered wilderness that even pioneers had then but a poor opinion of. What they suffered, more especially the gently nurtured among them, the women, and the old people; how heroically they bore it; and how great at first was the mortality among them, there is no space to relate here. Nor is there room for the more complicated tale of the manner in which the lands were selected and settled upon. These grants were scattered about in various parts of the province according to groups, regiments, and similar affinities, and often entailed long, arduous journeys by water or through trackless woods. struggle was won through in the end, though at what cost will never be more than half-known.

But in the course of years a brighter future dawned, and comfortable homesteads and thousands of acres bearing fair crops were opened to the sun. Small towns, too, arose, affording scope for trade and the professions. What is now New Brunswick attracted so many settlers up its rich river-valley of the St John that almost immediately it was cut off from Nova Scotia into the modern province. The fertile island of Prince Edward, to the northward, also attracted its quota. Hard as were the primitive conditions of the Loyalist settlement of these maritime provinces, they were not quite so terrible to the pioneers as those of their brethren in Upper Canada. was at least a settled Government, a focus of administration ready-made, at Halifax. All this, too, was a maritime country, open everywhere to the trade and shipping of the Atlantic. tunities in lumbering, fishing, and trading, as well as farming, came in time to the settlers. Parliament in the meantime had voted three and a half millions to the expatriated Loyalists; and, though it took some years to allot this money, the Nova Scotians in due course got their share. A settled Government, with a quickly growing population of fifty thousand, provided many

berths for the more highly qualified among the Loyalists, most of whom had small military pensions, and nearly all eventually their share of compensation-money, which brought not only relief but a start in some business enterprise.

No sensible flow of ordinary immigration came thus early into the maritime provinces, but some thousands of Gaelic-speaking Highlanders were introduced by philanthropic agencies. After thirty years Nova Scotia was practically in the hands of the United Empire Loyalists, as they proudly called themselves, with a large residuum of simple, useful, but ignorant Highlanders and still more ignorant French Acadians. Much the same conditions prevailed in New Brunswick.

Representative government was established in both provinces under a British governor, a nominated council, and an elective Lower House. Class distinction in the old American colonies had been clearly marked. The 'Tory' refugees, who hated republicanism and all its dogmas with a bitter hatred, had not been weakened in their social traditions by their temporary hardships. The class among them who had been leaders in the old colonies became the natural leaders in these new ones. In fact, an oligarchy arose which came in time to monopolise all power, place, and favour; and, in spite of some moderate waves of immigration from England and the Scottish Lowlands, it was not broken for half-acentury. Halifax society is to-day the most 'English' in habit of all the older Canadian cities. Of the half-million souls in Nova Scotia, probably every other person is of United Empire Loyalist descent, and he will let you know it at the first opportunity! Of the others, half at least are of Highland origin, and Gaelic is still spoken in remote places.

Upper Canada was thrown open to the refugees on the same conditions and at the same time as were these other provinces. West of Montreal, the limit of French settlement, all was then a howling wilderness. The present fertile and prosperous Ontario was vaguely regarded as uninhabitable. But official prospectors had just been despatched thither, and reported favourably; so surveys were at once made. The chief base was formed at the eastern end of Lake Ontario, and became the now well-known town of Kingston. A smaller nucleus of settlement was formed at the lake's western extremity, near Niagara Falls. About eight thousand Loyalists went in the first batch to Upper Canada, including seven Loyalist regiments, with their friends and families, some disbanded regulars, and other non-military groups. Upper Canada was more difficult of access than were the maritime provinces, and pioneer life there even harder. Some of the exiles found their way by sea to Montreal, and struggled thence up the St Lawrence, with its many unnavigable rapids; and more toiled painfully through the northern wilderness which then stretched far south of the Canadian boundary of to-day. Scattered here

among the dense forests along the shores of Lake Ontario, then lifeless but for the western trader's cance, these people suffered even worse things than the Nova Scotians, or at least suffered them much longer. It was better land, to be sure, when once cleared; but the utter want of an outlet to the world intensified the struggle and the suffering. Furthermore, it baffled the Canadian Government's overtaxed endeavours to maintain the supply of food, implements, and necessary draught animals. In the second winter the founders of British Canada were on the verge of starvation. All the horses and oxen had been devoured. Tradition tells of much-prized beefbones which made the round of half-starved families to be boiled and reboiled by each. Women and children roamed the spring woods in quest of roots and herbs to maintain existence. Their clothes were all worn to rags, and some had to cover their nakedness with skins; and though many of these people were raised in luxury, fortunately the mass were plain countryfolk, at least used to North American conditions, not helpless, inexperienced Europeans. were neither doctors nor even drugs. The scarce grain was pounded into flour with cannon-balls. All families, whether they owned a thousand or a hundred acres, were alike in their rude huts shut in by the tangled, forbidding forest, congealed in winter and alive with stinging insects through the summer, against which the greatest courage, under such ill-equipped conditions, could make but slow way. The first two wheat-crops were grown mainly in the little, stump-strewn clearings, with the aid of no implements but hoes and mattocks. Wolves howled round the houses, and, with the bears, destroyed what few sheep or calves the early settlers possessed.

This is no fancy picture. It happened but yesterday, and a large amount of testimony is forthcoming. Indeed, any one who knows the Canadian forest primeval knows well that such sufferings and many more were inevitable to the situation and condition of those brave but hapless Loyalists. The climate, however, was healthy and the land rich. As in Nova Scotia, the settlers won through in course of time. The higher class, aided by the rather belated compensation-money, left the forests, founded small towns, and, following professional and commercial life, became an oligarchy like that of Nova Scotia, and practically ruled Upper Canada till the rebellion of 1837 broke its back.

But after these United Empire Loyalists had proved the quality of the soil of Upper Canada, and particularly when, in 1791, it was formed into a separate province from Quebec, under repre-

sentative government, Americans began to pour in their thousands into the cheap fertile land, as they are pouring now into north-western Canada. They were accepted by Government on taking the oath of allegiance, but regarded askance and mightily mistrusted by the Loyalists, who in the good things of the now rapidly developing country had got a long start of them. These later Americans, mainly plain working folk, soon outnumbered the Loyalists; but the latter had a grip of the country which the Yankeephobia of their own rank and file enabled their leading families to keep a tight hold of, politically and socially.

By the time of the American war of 1812 there were seventy thousand people in Upper Canada—probably twenty-five thousand of United Empire Loyalist stock, thirty-five thousand casual later Americans, and ten thousand British and Irish, nearly half Gaelic-speaking Highlanders. In French Canada there were about three hundred thousand French and thirty thousand Loyalists and later Americans, the two last-named, however, in a region to themselves, south of the French country, and united by their antipathy to Racial animosity, indeed, made the French. representative government at Quebec stormy and farcical. In Upper Canada the successful determination of the Loyalist oligarchy to govern the later Americans and British Old Country element made it quieter, but equally farcical; while in the maritime provinces racial divisions had no place, and all went comparatively smoothly. With the three years of fierce fighting against American invaders (1812-15) the French had very little to do. The United Empire Loyalists of Upper Canada, with the British regulars, bore the main brunt of the attack, a fact which seemed to give them a further claim on the country. It was not till the long peace after Waterloo that British and Irish emigrants seriously went to Canada, and then they fairly swarmed in. The point to be remembered is that Canada had been ours for fifty years, had founded four Parliaments, had fought two successful wars, and had achieved a British population of nearly a quarter of a million before Englishmen or Lowland Scotsmen, save as Government officials, began to take any share worth mentioning in its life. Most of the leading families to-day in the maritime provinces are of American Loyalist origin. Twenty years ago, before the huge changes in its fortunes, half of the more prominent families of Ontario were of the same stock. And these are the people who, as a class, always have been, and in the main still are, most actively attached to the British. connection.

A KNIGHT ON WHEELS.

CHAPTER XII .- RED GABLES.

AN hour later, shopping commissions having been executed, they clanked majestically homeward. The journey was completed without further mishap; though a frisky calf encountered by the way almost wrecked its own prospects of ever becoming veal by an untimely indulgence in the game of 'Come to Mother, or Last Across the Road'—that was how Mr Mablethorpe described it—gambolling unexpectedly under the very bows of Boanerges in response to the ill-judged appeal of an anxious parent on the opposite side of the highway.

Presently the long red wall, with its polite notice to motorists, came into view on their left, and the car slowed down. Philip realised with

pleasure that this was his destination.
'Did you put up that notice, sir?' he inquired.

'I put it up,' replied Mr Mablethorpe, 'but my daughter composed it. She makes rather a special feature of the common courtesies of life.

Mind your elbow against that gatepost.'

Two minutes later Philip found himself being presented to a languid but still pretty lady, who assured him-in a speech which appeared, in some curious way, to be addressed to Mr Mablethorpe rather than himself—that she was charmed to meet him, in spite of a headache, and that she had no doubt that fresh servants would ultimately be forthcoming to take the places of those whose resignations the introduction of an unexpected boy into a hitherto tranquil household would naturally precipitate. Adding a mournful postscript to the effect that Philip would doubtless have made an admirable secretary for her husband but for the fact that his uncle would inevitably insist upon his speedy return to Holly Lodge, Mrs Mablethorpe, with a look of patient endurance upon her delicate features, faded away upstairs, to bedew herself with eau de Cologne and partake of luncheon in bed.

'Friends,' observed Mr Mablethorpe solemnly as his wife disappeared, 'are requested to accept this (the only) intimation and invitation. Now, Philip, come and be introduced to my daughter.'

The three spent a perfectly happy afternoon together. Miss Dumpling treated 'the new inmate,' as Mr Mablethorpe called Philip, with marked favour, introducing him seriatim to three cows, named respectively Boo, Moo, and Coo; a family of lop-eared rabbits; and an aged gramophone suffering from bronchial weakness.

Towards tea-time Mr Mablethorpe, who knew his wife almost as well as he loved her, penetrated to the invalid's bedroom, and there apologised in the most handsome manner for several crimes which he had not committed. Mrs Mablethorpe, having delivered herself of a brief homily upon the whole duty of a husband entrusted with the

care of a delicate wife, now felt sufficiently recovered to come downstairs and partake of a tea of encouraging dimensions.

Philip surveyed her curiously. His feminine

horizon was enlarging itself.

'Julius dear,' observed Mrs Mablethorpe presently, 'I know, of course, that it is perfectly useless to say anything to you about Baby's upbringing—the child is ruined for life by this time; but I must protest, however feebly, against your feeding her with that sweet and sticky cake. We shall have her running in and out of the dentist's every five minutes in a year or two.'

'You hear that, Daniel Lambert?' asked Mr Mablethorpe of his ruined child. 'Mother says we aren't to have any more cake. I think it is most tyrannical of her; she knows how we love running in and out of the dentist's. But we must obey orders. About turn, and let us get back to the bread-and-butter! Come on, I'll

race you!'

Mr Mablethorpe began to munch bread-and-butter with enormous enthusiasm; and poor Dumps, reluctantly laying down a generous slice of plum-cake, followed his example. But when the trio finally obtained permission to retire to the library and play at 'bears'—a pastime to which it appeared that Mr Mablethorpe was much addicted—and tumbled upstairs together, Philip overheard the unregenerate father whisper to his daughter, 'If you wish a wish and then feel in my pocket, old lady, you may find something.'

In the library the Dumpling offered Philip a

share in a large slice of plum-cake.

Philip retired to bed that evening in the room which had been prepared for his reception (fortunately without causing any break-up in the staff of the establishment), but did not sleep for a long while. He had much to think of. It seemed almost incredible that he had left Holly Lodge only yesterday, and that it was only last night that he had slept with the wolf-scarers in Montagu Falconer's studio; yet it was a fact. The remembrance of the studio brought back visions of Peggy. He wondered when, if ever, he should see her again. He compared her with Dumps, but quickly realised that comparisons were impossible. Dumps was a decent little kid, though fat; but she was not Pegs.

Then he thought of Dumps's parents, and he began to understand that it takes all sorts to make a world. He was beginning to realise the importance, in every department of life, of 'making allowances.' This duty was not confined to one sex, as he had previously imagined. Mrs Falconer, it was true, spent her life in making allowances for Mr Falconer. But here was Mr

Mablethorpe doing precisely the same thing for

Mrs Mablethorpe.

Finally, he thought of Uncle Joseph and the Beautiful Lady. Perhaps, he reflected, if these two had made allowances for one another earlier in life, their coming together would not have been delayed for ten years.

Incidentally he made a note that, dragons having become obsolete, a Knight might do worse than set out to persuade people to make allow-

ances for one another.

CHAPTER XIII .-- THE OFFICIAL DEMISE OF TOMMY SMITH.

NEXT morning Mr Mablethorpe, after a quite unexpectedly serious conversation with Philip, departed upon Boanerges to seek out

Uncle Joseph.

Having achieved a comparatively unadventurous journey-if we except a collision with a milk-cart in the Finchley Road-he drew up at Holly Lodge, which looked very much the same as when Philip had left it two days before, save that a large board, newly painted and announcing that This House was to be Let or Sold, projected over the laurel hedge which separated the gravel-sweep from the roadway.

Uncle Joseph was at home, and received his

visitor in the library.

The owner of Boanerges came to the point at 'My name,' he said, 'is Mablethorpe. do not suppose that the information will interest you in the least, but it is customary to give it. What is more to the point is the fact that I have found a stray nephew. Have you lost one?'

Uncle Joseph admitted that this was so.

'He appears to have left home,' continued Mr Mablethorpe, 'two days ago, owing to a sudden and rather unexpected change in your domestic routine.'

'He told you the story, then?'

'Yes.'

'I cannot quite understand,' said Uncle Joseph, 'why the event to which you refer should have made it necessary for him to leave my house. In fact, I should have thought it would have been an inducement to him to remain. Have a cigar?'

Mr Mablethorpe helped himself, and replied thoughtfully, 'I gather that the-the event to which we have referred absolved him, in his rather immature judgment, from further allegiance to your person and service.'

Uncle Joseph eyed his visitor keenly. 'Service -eh? Did he explain to you the nature of his

services?'

'Yes; he told me all about it—The Kind Young Hearts, the Unwanted Doggies, Tommy Smith—everything. I made him tell me every shred of the story. I would not have missed a word of it. It was priceless—immense—the most brilliant thing I ever heard of. As a brotherartist, in a smaller and less remunerative way, I beg to offer you my felicitations and thanks. But our young friend Philip appears to have found his share of the work uncongenial. Apparently his conscience'-

'Not his conscience,' interposed Uncle Joseph; 'his disposition. The boy is a born sentimentalist, like his father before him. I had noticed the paternal characteristics developing for some time, and I expected an upheaval sooner or later. The—the event to which reference has been

made precipitated matters, that is all.'
'Quite so,' agreed Mr Mablethorpe. 'But whatever his underlying forces may be, your nephew appears to be a youth of some directness of character. When I intercepted him yesterday he was on his way to Coventry, with the intention of studying the mechanics of automobilism. He is now in my house, and, on my representations, has agreed to place his future unreservedly in your hands. But I don't think you will persuade him to go back to the Little Tommy Smith business, you know.

'There is no need,' said Uncle Joseph. 'Little Tommy Smith is dead, and his works are perished

'So I had gathered,' said Mr Mablethorpe. 'How!' asked Uncle Joseph, a little startled.

Mr Mablethorpe waved his hand in the direction of the window. 'Partly from the presence of that board outside,' he said, 'and partly because, in the light of—of recent events, any other dénouement would have been an inartistic anticlimax, contrary to the canons of the best fiction.'

Uncle Joseph surveyed his rather unusual visitor with interest. 'You appear to know

something of men and women,' he said.

'I have to,' explained Mr Mablethorpe. 'I make a living by studying the weaknesses of mankind, and publishing the results of my observations at four-and-sixpence nett.'
A novelist, I gather?'

'Yes, but of the obsolete school. I hate your morbid, soul-dissecting, self-centred, pessimist like poison. I go in for happy endings and the eternal good in human nature. In this respect I rejoice to observe that you are not going to disappoint me.'

Uncle Joseph's cold blue eyes glowed suddenly.

'No, thank God!' he said, 'I am not.'

After that he told Mr Mablethorpe the rest

of the story.

'Her husband died five years ago. I rather gather it was drink, but I did not press the point. I am quite content to accept the official virtues of the deceased as enumerated on his tombstone, and let his hobbies drop into oblivion. She had one little girl, who died too; and since then she has been living alone—quite alone. Poor soul, she has paid—paid in full! Perhaps I have too. Pride—pride! Have you ever Pride—pride! noticed, in your observations of human life, how very heavily—disproportionately, one might say -God punishes Pride? Sins which arise from weakness seem to get off, on the whole, rather more lightly than they deserve; but the sins of the strong-pride, obduracy, even reticencenever! I suppose it's God's way of rubbing in the fact that Strength belongeth to the Lord alone.

'I don't think that the strong get punished more heavily than the weak,' said Mablethorpe; 'but they feel their punishment much more keenly. It is impossible to punish the weak. They run howling to their betters the moment they feel the first whack, and unload their woes But the strong, especially the on to them. proud, endure their punishment and say nothing. That's why it hurts so.'

'Perhaps you are right,' said Uncle Joseph. 'But we appear to be digressing into philosophy. I am to be married next month, and we are going to live in the country. She has been left very poorly off, as the money has passed on with the title. But I think we shall be tolerably comfortable, and busy. We have some small arrears of happiness to make up.'

'And your benevolent exercises,' said Mr Mablethorpe, after a long silence, 'are now a

thing of the past?'

'Yes. Frankly, I am sorry; for the people who paid the money extracted a large amount of innocent pleasure from giving it, and it was a perfect godsend to the people who ultimately received it. But, of course, pedantically speaking, the whole thing was illegal, and Vivien has

all a woman's respect for the letter of the law. So I intend to close down. My charities will suffer, I fear; but possibly I shall be able by personal service to make good some of the deficiencies caused by my failure as a source of revenue. Still, I shall miss it all. I enjoyed composing the appeals particularly.'

'I rather fancy I once received one from you,' said Mablethorpe. 'I read it with great appreciation. In fact, I answered it. But now, as to Master Philip. What are your views?'

'Supposing I hear yours first?' said Uncle

Joseph.

'Very well. I am a comparatively prosperous man. I have no son. The boy interests me, and I scent copy in him. I also want an occasional secretary and amanuensis. I suggest that he should make his headquarters with me, and I will be responsible for his education. He shall visit you whenever and for as long as you want him. The only stipulation I make is that we have no formal agreement or business arrangement about him. I am not a man of business, and I hate legal contracts and attempts to harness the future more than anything in this world. Will you let me have the boy for as long as he is willing to stay with me?

'Certainly,' said Uncle Joseph.

And with that word Philip's career as a misogynist and recluse came to an official conclusion.

(Continued on page 196.)

TRAVELLING EXPERIENCES.

PART II.

TWENTY years ago I was in Barcelona, on my way from Rome to Madrid. I was in a hurry to reach Madrid in order to witness a great bull-fight, in which Frascuelo, the famous diestro, was to kill the bulls in the most approved fashion. When I declared my intention of leaving by the next train, all my acquaintances in Barcelona protested against my rashness. The express only ran three times a week. If I waited twentyfour hours, I could take the express instead of travelling by a slow train. My admiration for Frascuelo gave way before the arguments of my Barcelonese friends, and I postponed my departure till next day. The following day, on entering the train, I asked how long the express would take to go to Madrid. 'Twenty-two hours.' was the answer. 'And how long does the slow train take?' 'Twenty-four hours.' You may not believe me, but I did not swear. I did not swear, because I was dumfounded. I had lost twentyfour hours, and a bull-fight and Frascuelo, just to save two paltry hours in the twenty-four!

There were no Pullman or sleeping cars in the train, so I made myself as little uncomfortable as possible in a first-class carriage. The carriage was empty, but not for long. A gentleman came

in with a large gray moustache, and a larger box that he placed on my feet. Then followed a priest with another big box, a bag, and two baskets, which he placed promiscuously on my knees and my neighbour's arms; then a very polite, black-bearded hidalgo, with several boxes and a pasteboard hat-box, which were distributed over our feet, knees, arms, and shoulders. To make a long story short, in a quarter of an hour the carriage was full of boxes and bags of all descriptions, painfully supported by me and nine high-spirited, good-humoured, talkative gentlemen. I tried to protest, but every time I opened my mouth something fell on me. We had only time to attend to the several articles that lost their precarious balance owing to the jerky movement of the train, and endangered the safety of our heads and limbs. My fellow-travellers seemed quite familiar with these dangers, and dexterously avoided them, and kindly preserved my life; and they showed such good humour that I could not but enter into the fun of the thing. In an hour from our start the train had shaken us all into place-boxes, bags, baskets, and travellers - so that we were relatively comfortable—the boxes very much so.

could not move, it is true; but after such violent exertions we did not want to.

Time went on, and I began to feel hungry. After a few hours I was positively starving. When I felt I was going to faint, I pulled out what energy was left in me and inquired from my neighbours at what station was the restaurant where I could get some luncheon. The answer was that there was no restaurant on the line. The train stopped at a station every quarter of an hour, but never for more than five minutes. Quick lunch had not yet been invented—at least not in Spain. I was in a terrible plight. I had bought a railway ticket for a living person at Barcelona, and I was going to land a corpse in Madrid. It would be a most irregular proceeding on my part, but it was not my fault. Anyhow, considering the kindness that my right-hand neighbour had shown, I began to impart to him my last wishes. But then all the boxes—hatboxes, leather boxes, wicker baskets, everything —came down (not by their own will this time); charitable hands opened them, and out sprang the most appetising things my hungry nostrils ever smelt. The gray-whiskered gentleman produced a brown roast-fowl, the blackbearded hidalgo presented a whole turkey, the priest unveiled the best-seasoned salpicón that was ever made in Catalonia, and veal and mutton and beef all danced before my dazzled eyes, and shortly afterwards through my parched throat. And bottles of blood-red, blood-making Val-de-Pena and Rioja, and gold-coloured, gold-worth sherry, were quickly opened and more quickly emptied. And I blessed the Spanish hospitality and the Spanish geniality, and the Spanish way of travelling with boxes, and above all the Spanish salpicón.

Spain would be a charming country if it had no railways. The railways have destroyed the picturesqueness of the country without adding much to the traveller's comforts. Once I landed at Vigo, coming from England to take the train to the Portuguese frontier. As I landed at noon I went to the best hotel, which was no better than a decent inn, and inquired what time the train would leave. They told me it left at halfpast seven in the evening. I asked when the table-d'hôte dinner was served, and was told, 'Six o'clock;' whereupon I concluded that I should have an hour to dine and a full half-hour to drive to the station, which was quite near. I was punctual at dinner, quite against my principles; the bill of fare was very substantial, well cooked, and rather long. At seven sharp I had finished my dinner, a cup of excellent coffee, and a little glass of ojen, and had lighted a cigar. I

ordered a cab.

'What for?' a man asked.

'Why, to take me to the station.'

'It is too late, sir.'

At that moment I heard a long whistle, and a few seconds after the panting of an engine.

'Don't you hear?' added the man. 'It is the train.'

This time I could not keep my temper. I swore in Spanish. I must say that Spanish is for swearing what Latin is for improprieties and French for nonsense—they don't sound bad. When I had exhausted my repertory of Spanish oaths I remonstrated with the innkeeper. 'Didn't you tell me that the train leaves at half-past seven?'

'And so it does, sir.'

'But, then, your infernal clock is half-an-hour slow, on purpose to mislead the unsuspicious traveller. You are'——

'Excuse me, sir,' interrupted the innkeeper in his grandee manner, 'the train leaves at halfpast seven, Madrid time, which is seven o'clock in Vigo.' And he turned his back on me with as noble a gesture as if he carried a black cloak and a rapier, and had a feathered hat on his head.

The next train was to leave at six o'clock the following morning, Madrid time, which meant half-past five by the local clock. I ordered a little omnibus at five to take me and my luggage. The omnibus was punctual. They put my boxes on the top, and I stepped into the disjointed vehicle, drawn by a still more disjointed horse. All the windows of the omnibus were The morning was raw, and I had got a cold. So I pulled up the window behind me. The frame rose, indeed, but there was no glass in it. I tried all the frames one by one. The glasses had all been broken, no living person remembered when, and had never been replaced. In this way I drove to the station. I don't call it a comfortable way. Nor was it a quick way; but this I must own: it was the only way. Therefore I drove on without grumbling. Besides, it would have been very difficult for me to grumble. I had to grumble or to sneeze, and under the circumstances I had no choice. If I had had the choice, I would rather have done something in the grumbling line.

As soon as I reached the station I looked for a first-class carriage. Every carriage seemed to be third-class, considering that there are no fourth-class carriages in Spain. Finally I entered one which a railway official assured me, under oath, was a first-class. The plan of that carriage was rather new—the only thing that was new about it. Two long, longitudinal, back-to-back seats ran down the centre; and at each window there were two small seats. I took one of the window seats. The country in the north of Spain is really beautiful. The only trouble was that the windows were so high and the seats so low that one had to make a choice between sitting down and seeing nothing but the sky, or enjoying the view and standing all the time. I suppose the old spirit of the Spanish Inquisition has invaded the Spanish railways. I began by standing and enjoying the earth, and finished by sitting down and contemplating the sky.

While I was engaged in enforced meteorological observation I noticed that the train stopped every ten minutes, and every stoppage lasted about a quarter of an hour. I was astonished that there should be so many stations and so much heavy traffic to justify the delay at each of them. I got up and put my head out of the window, only to see an empty platform, and two lonely railway officials and the guard of the train smoking innumerable cigarettes with philosophical disregard of time. I called to the guard and inquired why we did not start.

'Si no hay prisa, caballero' ('There is no hurry, sir'), was the calm reply.

'But I am in a hurry,' I retorted.

'Then you had better walk;' and he lighted his twentieth cigarette, and went on discussing the last doings of the *alcalde* of some neighbouring town.

Now, the carriage was bad, the line was bad, the service was bad, but the advice was unquestionably good. I remained in the carriage, risked the line, submitted to the service, and did not follow the advice. Such is human nature; such is at least the human nature of a traveller.

They are never in a hurry, those proud, romantic Spaniards. If they walked fast, how could the Spanish women keep their graceful carriage, balancing their hips, which gives you a slight suggestion of some sensual Eastern dance? How could every young man throw flowers at every pretty woman he crosses in the promenade? I do not mean actually throwing real flowers. To throw flowers (echar flores) is a Spanish locution that means to pay compliments. Is it not picturesque and poetical? A pretty woman passes, and every young man (and some old ones too) will say something to praise the dark fire of her eyes, the smallness of her feet, or the bright red of her lips. No, the Spaniards are never in a hurry. That is why railways, telegraphs, and all those abominable things that shorten distances and life are incongruities in Spain; and it is quite natural that they should try to adapt themselves to the surroundings. They do it by showing the utmost indifference to all considerations of time and space.

A friend of mine was once travelling on a little provincial railway in Spain. In the middle of the night the train stopped. Being a methodical man, he looked first at his watch and then at the time-table to see what station it could be. To his great surprise, no station corresponded to the hour. Then he looked out, and in the pitch-dark night he could distinguish a barren wilderness. The engineer and the guard, muffled up, were walking up and down beside the train, smoking cigarettes. Some accident had probably happened. Therefore he alighted in order to inquire what was the matter.

⁷ Pues nuda, caballero; se acabò el carbon' ('Why, nothing, sir; the coal's all gone').

Nothing of the kind could happen in the United States. But that does not mean that

travelling is bliss there. Misadventures are the general rule. I am not going to bother you with boxes lost when they were needed, and found when they were no longer useful.

Some exacting Europeans complain of the heat in the American trains. In fact, they are artificially heated, and heated in earnest. Everything is properly done in America. As the trains go fast and the roads are dusty, all the windows and ventilators are carefully shut. That is why some travellers think the air is stifling. No doubt there are cold cars too, but they are only for pork or fish.

But the most objectionable feature of the American trains is the sleeping-cars. They are long cars with two rows of beds on each side, and you have to dress and undress on your bed. I forgot the number of my bed, and as I pulled the curtain aside to climb on to it I was greeted by the wild screams of the occupant, a virtuous spinster, who lay in bed with a cap on her head and pince-nez on her nose. I tried the next one, and was received by the most appalling swearing. Finally heads popped out of every curtain, and a negro porter pushed me ignominiously to the end of the carriage to the accompaniment of the laughter, scoffing, swearing, and threatenings of the passengers. My bed was in the next carriage.

Travelling through the ages as well as through the world, I have come to motoring. A few years ago an American lady, a friend of mine, asked me to join her motoring-party for the last part of her trip across Europe; we were to meet at Strassburg and motor to Boulogne. I thought I had found the ideal method of travelling. should not be the slave of time-tables. I should be able to have my meals quietly, and the necessary amount of sleep; to stop in a place as long as I fancied it, or go on if I did not like it. I accepted the invitation with alacrity. I arrived at Strassburg at night, but there was no news of my friend. The hotel porter obligingly informed me that there was a telegram for her, and I politely informed him that I had sent it, informing her of my arrival. Next day, while I was in the cathedral watching the famous clock as it struck twelve, previous to taking the train back, I saw my friend walking up the church in disreputable clothes, dusty and shabby, as if they had borne the brunt of innumerable battles. She had been motoring for two months with only a small valise. I went up to her, when she told me that the motor had broken down the night before, and could only be repaired that morning. Would I mind going at once to the hotel and ordering lunch, as we had to start in an hour, without seeing Strassburg? As my friend said there was no time for explanation, I had to trot off. We sat at lunch, had some eggs-and then, would I mind going without the mutton, the pudding, and the coffee, as it was getting late, and we must start at once?

Then I understood. She had committed some enormous crime, the police of the whole world were pursuing her, and she was running for her We rushed along the roads. At 5 P.M. we stopped anywhere, sat by the roadside, and there she produced some lukewarm tea out of a thermos flask; we drank it in a hurry while we swallowed a couple of biscuits; and again we started. At eight o'clock, she said, we must arrive at Saarbrück, and dine quietly at a hotel there. So we fled again from the pursuing party, but we missed our way, and at eight o'clock nobody knew where we were. Nor did the police, fortunately. We had some cold beef at a roadside inn, and again we started. We arrived at Saarbrück at half-past ten, and went to bed, exhausted by the wild chase that had lasted the whole day. Next morning we had to get up at seven, take a hurried breakfast at nine, and start again. My wily friend, no doubt to put her pursuers off the scent, always announced that we were going to have a quiet meal at a good hotel in some big town; and every time we lost our way, and had to content ourselves with some scraps at a 'pub' by the roadside. In this way we crossed charming Nancy, with its memories of Marie Leckinska's father; Rheims and Amiens, with their splendid cathedrals; and never did we stop longer than was necessary to sleep and have a hurried breakfast. At the end of a week we arrived at Boulogne, without having stopped to look at anything but Michelin shops. Now and then my friend insisted on driving, and she always man-

aged to burst a tire. She was particularly clever at that, and it broke the monotony of the race.

Then we all collapsed, the car as well. There was nothing to do but submit to our fate, and I had visions of my poor friend arrested, convicted, and executed. Next morning she appeared at breakfast as collected and cheerful and amiable as she used to be before she possessed a motor-car.

'Wasn't it delightful?' she said. 'We drove at an average speed of forty-five miles an hour.' 'And three tires a day,' somebody added.

After all, there was no crime, no police, no chase; only a race against time and common-sense.

This was not the last of my travelling experiences, which have been more varied than pleasant. But I think no more are needed to justify my astonishment at the depraved taste of people

who travel for pleasure.

Now a new field is open for novel experiences. After the railway, the steamer, and the motorcar, the day of the aeroplane is just dawning. And when the long-projected tunnel between England and the Continent is built, we shall be able to go either under the sea or over the sea, for nobody will ever go on the sea. Life then will be unbearable. And the surface of the earth will be the last refuge of the fishes and the birds, that by that time, having a due share in the progress of civilisation, will travel alive, as they now travel dead, by train or motorcar; and, judging from my experiences, they are sure to arrive at their destination in a worse condition then than they do now.

PÈRE MUMBART.

PART III.

'WITHOUT the slightest suspicion, the cripple went out that evening as usual, and returned at half-past nine, never dreaming that he was being watched. Charbot, being the youngest, bravely volunteered to sleep in the chair, and heard the two go out with their buckets in the dark on the following morning; but otherwise he passed a wretched night for nothing.

'At nine o'clock the Major relieved him, and at about eleven their plan met its reward. Very quietly the door of the courtyard was opened, and stealthy but heavy steps were heard ascending. Instantly on the qui vive, the delighted Major went down just as the commissaire—a short, jovial man, with eyes twinkling in anticipation of some pork—arrived, with his subordinate Drax, outside Mumbart's door.

"Ah, you have come at last!" exclaimed the Major, paying no attention to their unutterable surprise. "We have been waiting for you.—Mardin," he continued, raising his voice, "he's come! he's come!" and very soon Mardin appeared on the scene, and, opening the

window, rang a great hand-bell to bring the others.

'Fairly caught, the commissaire was silent.

"Now, look here," said the Major to the commissaire, as Charbot and Legrange came hurriedly up the stairs. "Understand this: if that scamp in there, with his filthy pigs, does not allow us to have some pork, I will go out into the street with that bell, and return with a hundred poor starving wretches and break the door down;

so you can tell him that."

"I will. I will certainly do so," said the disconcerted commissaire as he knocked at the door, which was quickly opened to admit the two, and closed as quickly again. The inner door could not have been properly closed, for as they stood with their ears against the outside door they distinctly heard the pigs grunting near them. This was music to their ears, and the locataires smiled sweetly and knowingly at each other. They could even hear voices inside, but at first they could not catch what was said. Soon, however, they heard the clattering of knives and forks, and then the popping of champagne-corks.

Gradually restraint was thrown to the winds as the wine began to work.

'Out of sheer ennui, having nothing to do to pass the time, Mumbart had taught his pigs some little tricks, such as walking on their hindlegs and begging. And now, to amuse his guests, he made them perform. The animals, it appeared, had all got names. "That white one is Wilhelm," said Mumbart amid great laughter, "and that's Fritz, and that's Moltke," and so on.

'Von Roon, he told them, was very fond of rum.
"Come, Roon; here's some rum for you,"
cried the cripple.—"Now, you'll see, messieurs,"
he added, "when he has had it, he will lie on his
back and wriggle his tail, with his legs in the air."

Amidst roars of rough laughter, in which even the *locataires* could hardly help joining, they were evidently making the animal drunk. But so far as those outside the door were concerned the laughter suddenly ceased.

'Mumbart had a fine sense of humour, and was a good mimic, and it became evident to the listeners that he had picked up from the concierge particulars of their habits and customs, to an

extent that rather surprised them.

"It was the drollest experience, messieurs," said Mumbart, "that I have had for a long time. The other night two of these gentry came quietly upstairs to tell me about China. One was an old roué of a red-nosed Major who plays écarté with five kings if he gets the chance. Well, I very soon sent him about his business. Then came a bankrupt organist who married a sentimental widow without any hair on her head, simply for her money—an imbecile who writes silly songs that nobody sings, all about the spring and little birds on rose-trees. This fellow had an imaginary cousin in China, and he wanted to know if I had ever met him; but that game did not come off either. Then there's an old man as yellow as a louis, who has got two anæmic and neurotic daughters, who have had visions ever since they went on a pilgrimage, and who go to Mass at unearthly hours in the morning, and come back in a bad temper that lasts for the rest of the day. There's only one gentleman among the whole lot, and that is a Monsieur Legrange.

'These and many other piquant details the astonished listeners heard for the first time. Then the cripple went to the piano. He sang and played uncommonly well, especially the songs from La Grande Duchesse; even Charbot had to admit that. "Je suis moi le General Boum" was capitally rendered; and when the cripple sang them "Voici le sabre, mon père," with its rollicking chorus, it was as much as he and

the locataires could do not to join in.

'But at last the *commissaire* found that his time was up, and then, in a low voice, he and Mumbart arranged matters.

"They are coming now," cried Charbot, and

they all fell back from the door.

"Messieurs," said the jovial police-officer,

"Monsieur Mumbart and I have arranged everything. This is the 27th; on the jour de l'an you shall all have two kilos of pork, and the same amount twice a week in future, as long as the animals last. You must understand it is a question of their food lasting. I think you will admit this is a satisfactory arrangement."

'This proposal was at first received with great delight and loud acclamations, though some wanted to know why they could not begin at once; but Mumbart, who was standing behind the door with the chain up, was firm on that point; so, with mixed feelings, they followed the two officers downstairs, regarding with envy their pockets bulging with pork and Bardar's cigars, to say nothing of the bottles of cognac

that showed under their coats.

The next day a tall man with an unhealthy, white, waxen face and black beard, whom the concierge had never seen before, paid Mumbart a visit. It was a long, serious business, and entailed a great deal of haggling. The want of a large pair of scales was much felt. Mumbart and the visitor disagreed as to the weight of the At last, however, they came to terms. During the day two other strangers also came, and the same haggling took place. All that evening and the following day—the 29th— Mumbart and his nephew were so busy that they never went out. About midnight, in the little dark by-street behind, an ambulancestretcher on wheels, with a rounded cover, appeared with four men-Monsieur Blanard, the commissaire, the Agent Drax, and the cripple. Sacks were quickly lowered by ropes, and then the procession set off in the dark toward the boulevards; and when they got there, strangers, in some cases, as they met it, reverently took off their hats when they saw the Red Cross and the solemn men who walked slowly beside it. Exactly the same thing took place on the following two nights, the 30th and 31st December. The only difference was that on the last occasion, instead of going to bed as usual, Mumbart, with an enormous sack on his shoulder and a huge bag in his hand, went very quietly downstairs. He purposely went quietly, as he did not think it fair to wake the locataires, who were so thoroughly enjoying their rest, and dreaming of the pork that would so soon be theirs. Whatever sort of visions the two neurotic ladies may have had before, the visions they had that night were of a very worldly character.

'The concierge was dressed and ready. He was told, as a hundred-franc note was put in his hands, that he would find a nice piece of meat, some cigars, and a bottle of rum upstairs; and, with a hearty shake of the hand, Mumbart staggered along to Blanard's Repository, where he lived in clover till the siege was over.

'The jour de l'an, with a bitter wind, a gray sky, and murky clouds, heavily charged with snow, arrived at last; but to the expectant

locataires, when Mumbart's flight became known, instead of being a happy time, a day of gush and guzzle, similar to the English Christmas Day, of felicitations and good wishes for the New Year, it was only one of unmitigated sadness and bitter disappointment. Madame Charbot, who had written a pretty little ode on Hope, was so upset that, to quiet her nerves, she took to her bed; while her husband gave vent to his feelings by playing the piano in such a way that he smashed nearly half the notes. As for a pork-inspired March that he had composed to celebrate the occasion, he threw the manuscript on the floor and stamped on it; though, for all that, he did not disdain months afterwards, when his bitterness had to a certain extent evaporated, to use it as a "Gloria" in a Mass. Monsieur and Madame Mardin never spoke a word all day; and Celestine and Angelique, on learning the news when they returned from early Mass, went to their rooms and had hysterics. The Major, after the first explosion of anger, got out a riding-whip, and went round to see Charbot, and together they went to pay a visit to the concierge. Luckily for him, he was out. However, they ransacked his den, and helped themselves to some of Mumbart's thoughtful étrennes—a small box of cigars, half a bottle of rum, and a stale loaf, but, alas! no pork.

'To console himself that evening the Major went to a celebrated café on the Boulevard des Italiens. As an old and valued habitué, the proprietor, a tall man with a waxen face and black beard, received him warmly, and wished

him the compliments of the season; but the Major was still irritable and sulky, and hardly returned them.

""We have a bonne bouche for our old clients," said his regular garçon, with the extra politeness that is usual on the jour de l'an.

"What's that?" asked Ledelle.

"Fresh pork cutlets," returned the man in

an impressive whisper.

"Pork cutlets!" exclaimed the astonished Major, with shining eyes. "Sainte Vierge, why, I have been thinking of pork all the week! What's the price?"

"Fifteen francs for a small and twenty for a

large one."

- 'It was a terrible figure, especially as the Major had been reckoning on getting two kilogrammes twice a week for nothing; but the smell of some crackling from a neighbouring table was too much for him. It made him smack his lips and caused his mouth to water. But, after all, was it not the jour de l'an? So he ordered the garçon to bring him a large cutlet and a bottle of Barsac.
- "Do you call this a large one?" he exclaimed savagely when he saw it. "A large one?" he continued, putting on his glasses to inspect it.
 "Mais, monsieur," said the waiter apologetically, "you can see it, can't you?"
 "Oh yes, I can see it."

"Very well, then, that proves it must be a large one; because you can't see the small

THE END.

HOW TO PREVENT EXPLOSIONS IN COAL-MINES.

By J. B. ATKINSON, M.Sc., Consulting Mining Engineer, Retired H.M. Inspector of Mines.

THE disastrous explosion at Senghenydd, Glamorganshire, in October 1913, has once more drawn the attention of the public to the dangers of coal-mining; and suggestions are being put forth, and will be for some time, as to how these frightful accidents may be prevented.

It seems an appropriate time to draw attention to a subject which has for many years caused experts grave anxiety, not only on account of the inherent danger of the matter to be referred to, but also because it has been shown again and again that practical miners are extraordinarily ignorant of the danger, and act accordingly. The danger referred to is coal-dust.

It will be necessary, to some extent, to deal with the matter technically; but the writer will attempt to avoid too much technicality, and to bring home to the public in language as simple as possible the fact that hundreds of thousands of lives are almost daily endangered through neglect of the most obvious precautions.

The temperature of mines increases with depth. At about fifty feet below the surface the temperature of the strata is usually about the mean annual temperature of the district. Below that it increases one degree Fahrenheit for every sixty feet; so that at considerable depths the temperature is considerably higher than the mean annual temperature of the district. The effect of this is that the currents of air entering deep mines are raised in temperature, and their drying-power increased, and this leads to deep mines being very dry. Up to about one hundred yards in depth the mine may be wholly damp; then, as the depth increases, frequently only the main arteries along which coal is hauled and fresh air passes to reach the workings are dry, while the working faces and return airways are damp. At still greater depths the whole of the mine becomes dry.

Fire-damp is not found in great quantities at shallow depths, but after a certain depth is reached—usually about one hundred yards—it is always found in greater or less quantity. This fire-damp is usually only seen at the working faces, abandoned parts of the mines, and sometimes in the air-current in the return airways which carry off all the gas made in the mine, but which are rarely affected by extensive explosions, while the intake airways and haulage roads are often wrecked for their entire length. In the early days of mining this was a great mystery, and led to some very curious empirical explanations, such as, 'The explosion always faces the fresh air,' or 'always extends to the downcast shaft as an outlet,' or 'The gas seeks the fresh air;' the real explanation not being known.

Professor Galloway, of South Wales, deserves the credit of being the first mining engineer to offer the true explanation of the phenomena of great colliery explosions; and this explanation is afforded by the drying-power of the air increasing, as already explained, with depth, the consequence being that the main arteries of mines, along which all the haulage is conducted and the fresh air travels, and which are used for the passage of workmen and horses, have their surfaces more or less covered with dry coal-dust, which comes from two principal sources: (1) dust shaken out of or blown from the trains of tubs, often hauled at speeds up to fifteen or twenty miles an hour against large currents of fresh air on roads rendered perfectly dry by these currents; (2) coal-dust from the screening operations at the surface, usually conducted close to the tops of the downcast shafts, being caught up by the air descending the mines and carried along the intake airways. In the case of an explosion at Wingate Grange Colliery, long lengths of intake airways were wrecked in the Low Main seam, owing to an explosion of coal-dust and air on these roads, the coal-dust coming from the coal of the Harvey seam lying below. The coal of the Low Main seam was not a dusty coal, and the workings, except the intake airways, were not dry. The coal from the Harvey seam, a very dusty coal, was drawn at the downcast shaft past the Low Main seam, and screened close to the top of it, and in the course of many years dust from the screens was carried down the downcast shaft and deposited in the intake airways of the Low Main seam, extending for a distance of about one thousand yards from the downcast shaft, beyond which the intake airways were very free from coal-dust.

The explosion was initiated by the firing of a charge of geloxite, an explosive authorised by the Home Secretary for use in gaseous and dusty mines, on one of the main roads. The charge was not placed in a drilled hole but in a cavity, and was intended to dislodge a projecting piece of stone. The miner who fired the charge had no authority to act as he did; but having explosives with him, and nothing particular to do at the moment—he was waiting for mine-wagons into which to fill some stones which had fallen during the week-end—he employed his time in the manner stated, and had certainly no idea of any risk, as there was no probability of fire-damp being present, and naked lights were allowed to

pass the point, one having been carried past an hour or two before. The explosion was confined to the Low Main seam, and did not reach the dusty roads in the Harvey seam, lying below, owing to the absence of coal-dust in the shafts, which were more or less damp.

Another source of dust is coal blown from tubs raised at high speeds in the downcast shaft against a descending current of fresh air. The effect of these causes is that many intake airways in old collieries are as black as a chimney, the amount of dust usually diminishing, and often being nearly absent altogether, as the coal-faces are approached. This dust is not confined to the floor, but is heaped up on all projecting surfaces, and often accumulates as a sort of fringe on the underside of timber, brick arching, and roof-stones. It is wind-selected, and of a fine, impalpable nature, easily dislodged, and readily forming a cloud in the swift currents of air.

The writer, when Assistant Inspector of Mines in the Newcastle district, in conjunction with his elder brother, Dr W. N. Atkinson, I.S.O., now Divisional Inspector of Mines in South Wales, had from 1880 to 1885 the opportunity of investigating six considerable colliery explosions, causing a loss of life ranging from four to one hundred and sixty-four persons. In the explosion causing the loss of four lives there was more evidence of the existence of fire-damp in considerable volume at the time of the explosion than in any of the other explosions, which were all similar in respect that it was the main intake airways which were wrecked for thousands of yards, the working faces being only affected to a limited extent, and in some cases not reached at all; the return airways, which were free from coal-dust, escaping altogether.

The influence which coal-dust must have in colliery explosions was thus forced upon the present writer's notice, and in 1886 a book on Explosions in Coal-Mines was published, calling attention to these facts. The conclusions as jointly stated by the author and his brother are now accepted by every mining expert who has studied the question; but unfortunately the mass of practical miners are still unconvinced.

It may be stated that it is improper to speak of an 'explosion' of coal-dust or of fire-damp. Neither substance is explosive in itself, but only when mixed with a sufficient volume of air. Both are inflammable, and if the combustion takes place under certain conditions it is accompanied by violence. The conditions for both the initiation and spread of explosions of fire-damp and air with violence are easy of attainment. coal-dust and air it is different; but on the intake airways already referred to, where the coal-dust exists as an impalpable powder in positions from which it is readily shaken into the air, and subsequently sustained as a cloud by the swift current, the only other condition necessary for its ignition is a sufficient flame, and this has

in many cases been supplied by the firing of a shot on the intake airways; such shots having often, in former times, been fired, at the orders of the manager, by miners who had not the least

suspicion of danger arising therefrom.

The experiments on a large scale carried on under Dr Garforth's supervision at Altofts in Yorkshire, and financed by the coalowners of the country, have demonstrated without the shadow of a doubt that violent explosions can result from the combustion of coal-dust in air free from fire-damp.

The important point is the remedy. Nothing

is so imperative in connection with coal-mining as to keep these main arteries, the intake and haulage roads, so free from coal-dust that an explosion of coal-dust and air can neither be initiated nor extended along them. The provisions of the Coal-Mines Act (1911) dealing with this matter are lame and halting. The problem is by no means insoluble, and until it is solved there is just cause for complaint that enough is not done to protect the lives of miners. It is a public scandal that this has not been dealt with before.

CAGLIOSTRO AND MARIE ANTOINETTE.

By MAURICE MACDONALD.

[Count Joseph Cagliostro, a great eighteenthcentury charlatan, was one of the most important members of the Court of Louis the Sixteenth. He was expelled from France soon after the execution of Marie Antoinette, and died in prison at Rome. Contemporary writers state that he foretold the execution of the unfortunate French queen and Josephine's rise to power.]

IT was a beautiful, mild October afternoon. Seen from the Trianon, the magnificent palace of Versailles shone with unparalleled splendour. The noble avenue leading down to the lake, on which graceful swans glided to and fro, the glittering cascades, the stately trees, the gaily attired ladies and gentlemen who awaited the coming of Europe's fairest queen—all this looked like a scene from fairyland.

The courtiers assembled at the Trianon had not long to wait. Marie Antoinette, dressed in a perfectly shaped dark-green costume lavishly embroidered with gold, came quickly down the palace steps, followed by her friends Princess de Lamballe and Madame de Beauharnais (a new arrival at Court), and a little company of ladiesin-waiting. They were followed by the Marquise

de Neuilly, the queen's reader.

Once in the park, the procession turned to the right, following the wide alley which leads to the farms. Chattering gaily, this little group of beautiful young women presented a charming spectacle. Their bright-coloured dresses harmonised exquisitely with the tinted leaves, the green lawns, and the fresh autumnal flowers. The sun was still warm, and shone serenely in an almost cloudless, deep-blue sky. Below, the soft grass seemed to invite the caress of dainty, tripping feet.

The group of courtiers were impatiently awaiting their arrival, and one of them advanced

to meet the queen and her party.

'Ah, here is Monseigneur!' cried the queen

gaily.

Tall and well built, the king's brother, Count d'Artois, came quickly forward, followed by a

few gentlemen-in-waiting. He had been chatting with a stout man of short stature, who now stood a little apart. It was the celebrated Italian adventurer, now Count de Cagliostro, who had lately become a 'lion' both in society and at Court. His big, round face was olive-coloured, and his two large, protruding eyes were set above a thin, slightly turned-up nose. His cocked hat was adorned with a white ostrich feather, and the long tresses which hung from his oiled and perfumed wig were gathered together by a silken bow. His costume was a mixture of violet and gray, profusely embroidered with gold. Even the buttons of his scarlet waistcoat were precious stones of great value. His feet were shod with high-heeled, diamond-buckled shoes. His fat, white hands were set off with cuffs of priceless

As he was an Italian, a magician, and a man of wit, the eccentric foppery of his dress was regarded with indulgence; since it had become known that he was a protégé of the king's brother, certain gentlemen at Court tried to copy his dress and his accent.

'Madame,' said the gallant Count d'Artois to his sister-in-law, 'we are like poor plants exiled from the sun; we were languishing in the absence of your Majesty.'

Marie Antoinette gave a mocking little laugh. 'Your pretty compliment means that I have kept you waiting. But it's the fault of my dressmaker and Madame de Beauharnais, who has only just

arrived at Court.'

The queen indicated the new-comer, who seemed much embarrassed at finding herself the object of so much attention. The strange, exotic beauty of the young woman seemed to interest the Count, who saluted her in most courtly fashion, and began to converse with her.

Chattering, joking, rhyming, and flirting, the gay company arrived at the picturesque building which was then called the Queen's House. Marie Antoinette was perfectly at home there. Dainty little white sheep, all curled and beribboned, answered to her call; they were quite tame, and

rubbed their soft heads against her dress, begging for the tit-bits they were accustomed to receive. The other ladies and gentlemen extracted little dainties from their pockets, and fed the gentle animals, thus adroitly flattering their sovereign's harmless mania.

After a few minutes thus agreeably spent, a table was laid in the adjoining garden, and the queen took her accustomed place in the middle. The Count d'Artois sat opposite her, and Madame de Beauharnais found herself placed between him and Cagliostro. The only aliments provided were bread and milk from the farm, and, following the example of the queen, everybody found them delicious. Conversation soon became animated and boisterous, and on one occasion the Count d'Artois laughed so heartily that he broke the handle of a cup when placing it on the table.

The queen pretended to be very angry. brother, you are very awkward. You know the proverb, "He who breaks glasses pays for them;" and you will pay, my brother—you will pay. If you don't, something will surely happen

to you.'

'Is your Majesty superstitious?' Cagliostro asked.

'Very little,' replied the queen, 'although I have heard all sorts of evil predictions about myself. The great earthquake at Lisbon happened on the day of my birth, and the day of my marriage was one of terrible disaster at

A flight of crows went cawing hoarsely by in the blue sky.

'And you, madame,' inquired Count d'Artois, turning towards Viscountess Beauharnaisyou believe in prophecies and horoscopes?'

'Oh no, Monseigneur!' replied his fair neighbour, 'especially since'—— She stopped suddenly, visibly embarrassed.

'Especially since?' repeated the king's brother. 'I could not dare, Monseigneur, in presence of

Her Majesty.'

'My dear child, "my Majesty" orders you to

continue,' said the queen, smiling benevolently.

Madame de Beauharnais still hesitated. At last, after an effort, she decided to go on. as your Majesty orders me, it is especially since an old negress who has been in our family for a great many years told me, some time before I left Martinique to come to France, that I should one day be-more than queen.' She finished her story with a bright, merry laugh.

The ladies and courtiers all smiled, looking at

the queen.

'Truly,' said the queen, glancing meaningly at her brother-in-law, 'I don't see why the old negress's prediction should not come true. The viscountess is charming enough to reign despotically over many hearts.

'Oh madame!' protested the young woman,

blushing deeply. Cagliostro, who had been attentively watching his beautiful neighbour for some minutes, now remarked, 'Am I indiscreet, madame, in asking if you were married at the time of this prediction?'

'No, sir; it was five or six years ago.'

Taking from his pocket a small writing-slab of tortoise-shell, the magician placed a sheet of paper upon it, and handed it to the young woman. 'Would you have the goodness,' he asked, 'to write your Christian names and your maiden name on this sheet?'

Considerably astonished, the viscountess wrote the following words with a slightly trembling hand, 'Joséphine Marie Rose Tascher de la Pagerie,' which the astrologer read aloud.

'Strange!' cried the queen. 'You have two of

my Christian names—Joséphine and Marie.'
'Tis a great honour for me,' murmured Madame de Beauharnais timidly.

During this time Cagliostro had set to work. He erased some of the letters composing the names, and added others. After a few minutes he raised his head, apparently well pleased with 'I have never seen an anagram so easy to combine; it really arranges itself?

'And what does it say?' asked the viscountess, with a touch of inexplicable anguish at her heart.

'This,' replied the magician, amid an impressive silence: 'A l'âge de rose, Joséphine sera impératrice.* L'âge de rose,' he added, 'signifies, in occult language, the age of woman's greatest beauty.'

The sensitive young woman's eyes filled with

'Oh madame!' she cried, turning to the queen, 'it is only an amusement. I never aspire to be anything but your Majesty's humble servant.'

My dear child,' replied the queen, 'console yourself. I know it is only a harmless pastime, but I find it so amusing that I will see what our illustrious astrologer can make out of my name.' Raising her voice, and with a slightly mocking tone, she added, 'Monsieur de Cagliostro, be good enough to tell me what you can read in the Christian names, surname, and title that I received on the day of my birth: Marie Antoinette Joséphine Jeanne de Lorraine, Archiduchesse d'Autriche.'

The man of mystery, at this unexpected request, gave a violent start. 'Madame,' he replied, 'I respectfully beg your Majesty to allow me to decline her request.

The company of ladies and gentlemen looked on and listened in amazed silence. A bright gleam shot through the green eyes of the queen, whose expression had become suddenly grave. Assuming an authoritative tone, she rejoined, 'Monsieur de Cagliostro, I am one of those beings whom destiny cannot frighten, and who are always ready to meet their fate. Just now I requested, but now I order you, to cast my

^{*} At the age of the rose, Joséphine will be empresa.

horoscope, as you have done for Madame de Beauharnais.'

Smiling grimly and mysteriously, the magician bowed low. 'Your Majesty's will be done,' he replied. Then, turning to one of the servants, he asked for a piece of strong paper or cardboard and a pair of scissors. These articles were quickly brought, and while cutting out a circle in the cardboard of about a hand's-breadth in diameter, he explained, with perfect coolness, 'The large number of letters contained in your Majesty's names forces me to make these little preparations. I think,' he continued, addressing the queen, 'that your Majesty was born in the month of November 1755?'

'On the 2nd of November,' replied the queen.
'Is your Majesty still resolved to go on with
the experiment?'

Marie Antoinette, half-impressed, half-incredulous, answered, 'I desire it more than ever.'

The astrologer bowed gravely, and then his expression immediately changed. His whole attention riveted on the centre of the disc, his eyes alone seemed to live. They appeared to concentrate all the mental force of his being. After a few seconds he made the card, on which he had written the letters composing the queen's The letters names, rotate rapidly on a point. now appeared to make dark circles on the card. As the rotation decreased he picked out a prominent letter, and wrote it down on a sheet of paper, at the same time crossing it out on the card. Without moving, he repeated this process sixty times, while the company looked on with breathless attention. At last, with a sigh denoting intense mental and physical fatigue, he took up the paper, on which all the letters were now transcribed, and separated them into 'Madame,' he said, as he offered the paper to the queen, 'here is the anagram you ordered me to make. Fate often expresses itself in dark, mysterious language, which only the future can make clear. Do not ask me for any explanation, as I should not be able to give it.'

As if urged by an irresistible force, the queen seized the paper, glanced at it rapidly, and then read aloud, 'Attention, reine parue hier si chérie, à la hache déjà montée sur son lit de son.—J. C.'*

Courtiers and ladies looked at each other, stupefaction written on their faces. The first moment of surprise passed, the paper was handed from one to another and commented on in divers ways. It came at last to Count d'Artois, who read it and re-read it, muttering, 'What the devil does it mean?—Truly, Cagliostro, your anagrams are mortally lugubrious.' He then handed the paper to Madame de Beauharnais. 'Decidedly, madame, this oracular phrase is too vague to be compromising for its author. Yours was more gallant and more explicit.'

'But equally vain, Monseigneur,' she replied, smiling a little.

'Madame,' retorted Cagliostro, 'have you never heard that the ways of Providence are mysterious?'

'Heavens!' exclaimed the queen mockingly, 'I have never been so sure of that as I am to-day. But the air is becoming cool. Let us go in.'

On the 16th of October 1793, exactly ten years after this strange experience, a sinister-looking cart entered the Rue Royale from the Rue Saint Honoré. An immense crowd surrounded it on all sides. The rough paving-stones of the Paris streets made the tumbril jolt and shake as it proceeded on its fatal journey. In it were sitting a woman robed in white and a man dressed in black. Neither spoke nor heeded the vociferations of the crowd. The woman, whose hands were bound together, was Marie Antoinette, Queen of France, Archduchess of Austria; the man was a republican priest named Girard.

On the Place of the Revolution, now known as the Place de la Concorde, the crowd surged madly to catch a glimpse of the woman who had passed triumphantly by the same place, on the day of her marriage, twenty-three years before.

As they approached the place of execution, the citizen Girard heard her murmur, 'La hache montée.' A few minutes later the scaffold was reached, and the unhappy queen was laid on the fatal plank. Before the axe fell, at a quarter past twelve, the executioner heard her mutter, 'Le lit de son.'

Thus was fulfilled the great Italian magician's famous prediction; though whether it was clair-voyance, foresight, or merely coincidence, none can ever tell.

HER LITTLE SON.

My little son is five years old,
And the spring wind sweeps the skies;
The blue of heaven is not more clear
Than the light in his baby eyes.
Long is the course that his feet must run—
My little son.

My little son is fifteen now.
Oh the scent of a rose-filled bowl!
But roses themselves are not more pure
Than the thoughts in his boyish soul.
Onward he pushes through work and fun—
My little son.

My little son has become a man.
The autumn leaves crackle and part;
Their glowing colours are not more deep
Than the strength of a brave man's heart.
Fifty, but still the race is not done—
My little son.

Twenty more seasons bloom and fade;
How bitter the time of year!
The frozen snowflake is not more chill
Than the hearts that had held him dear.
Sadly they leave him; the race is won—
Her little son.

EDITH L. ELIAS.

^{*} Take heed, queen who seemed yesterday so beloved, to the axe already set up on its sawdust bed.—J. C.

THE HEART OF THINGS.

By HENRY LEACH.

LONDON, Yesterday.

DIFFERENCE between cities of highest importance and other places which are very near to them, as we think of distance in terms of an earth and the universe, has been well displayed by some recent events. A statesman of the time rose with piteous tale of patches of Britain that had lapsed back to a primeval state in which no man inhabited or cared anything for They had become deserted and desolate, like the surface of a planet upon which life had become extinct. Something had gone wrong with the system of human arrangement and control, and those who lived there once had gone This did not seem to be a proper state of things in the mother country of a most wonderful Empire. So the orator gave us some idea of the possibilities of one aggravating case. This seemed to be, then, one of that vast multitude of perplexing matters that so much weary and sadden the altruist of the wider outlook, one of those in which 'something ought to be done.' And just as this disturbing sentiment came to exist, a duke arose and said that to an enterprising Government he would dispose of some two hundred thousand acres of that desolate land at the price of twenty-two shillings and sixpence for each acre. Now it did seem that such a price for land was uncommonly small. An acre represents quite a good-sized piece of ground; you might build a large house and have handsome gardens surrounding it on less than one Within a few yards of where acre of such land. I write there is a fine restaurant with gilt and mirrors and gorgeous servants in knee-breeches and gold-laced garments, and there most of the bottles of champagne cost more than the price of one of those acres of northern Britain. Or, if it came to that, we could in a few minutes peck at some dainty dishes that together would cost us more than a couple of those acres. Again the reflection springs upon us and hurts a little as we think of the acres that might have been bought instead of other things, and which would have remained when, alas! their alternatives were such very fleeting pleasures that all we ate would not for one hour stop the hunger of some of the things that roam on those northern patches; and, again, that if landlord there, one might produce from the land most of what,

at such high expense, one now eats in London. It might not reward pecuniarily to do so, but that is not the question now. For the price of an evening's entertainment a whole acre of land for ever and ever, freehold in full title, and in the central country of the British Empire! Surely for the mere sense of ownership it would be good to buy many acres of land like this, when those nine half-crowns for each of them could never be missed. I feel that at such a price I would at any time buy a few acres of real estate on the chilly and distant moon. However, when writing now, the orator and the duke have done no great business together, and their negotiations are not concerned with the point we have in mind.

The other thing that has just happened, marking the difference I have hinted at, is that the other day a friend, with whom sometimes I play a game of golf, went into London and bought a patch of land in the very middle of it. He purchased nineteen acres, and along with his bit of Metropolis he took three or four theatres, a club, a market, an hotel, and a police court. It was a variegated lot; but on the whole it looked a little dirty, and as if it might need much cleaning and changing to acquire a thousandth part of the natural grandeur of those northern acres in all their desolate wildness. Yet my friend had to pay more than twenty-two and six an acre for what he bought. He had a few minutes' conversation with the representatives of another duke, and the result was that he agreed to pay nearly three million sovereigns for his piece of land. That seems to be a large sum of money. We are led to believe that there are gold-deposits beneath the surface of this land, and a little London 'rand' might be engineered here perhaps; but it is one of the wonders of this town that no gold-mine underneath would compensate for the disturbance of the surface, and owners would need to be convinced of large diamonds underground ere they moved the things on top to look for them. And another thought that comes upon us when we think of values and the changes worked by time is that much of this fine land that my friend has taken possession of belonged at one time to the Church. One of the bits of things that he has got for

No. 170.-Vol. IV.

FEBRUARY 28, 1914.

his money is a considerable property known as Covent Garden, a market for the sale of flowers, fruit, and vegetables; while those in need of parrots and canaries and such-like minor pets may obtain them there as well. is young in London, I know no more fascinating diversion than that of walking through this Covent Garden soon after daybreak on a summer morning. It is better to have gone to bed betimes the night before, but better not to go to bed at all, than miss this, which is commended to all thoughtful strangers as one of the most interesting and impressive occupations to be enjoyed in town. I have done it on many occasions, with bed before and without it, and would not lose those reminiscences of early days when all this land was like enchanted country of magicians and supermen. This part of town and another which is less than a mile away, being the Fleet Street of the newspapers, are the two busiest places in England at daybreak on the summer morn. In Fleet Street all that is done is indicative of the tremendous working of man, his magnificent enterprise, his explorations into the mysteries of earth and science, his difficulties with his kind in his own country, and his more serious trouble with the men of other lands, leading to angry words and acts, and the killing of tens of thousands of the human race. Fleet Street then, intensely human, is worldly to extreme. It is of the world, cent. for cent., pound for pound, love and hate, life and death, ego always-Cui bono? And it may not have struck the dwellers therein that no flowers grow in Fleet Street, and that, indeed, the people hardly ever wear them there. I have walked along this thoroughfare some thousands of times, and not yet have I discovered a flower-shop there; nor do I recall a flower-seller on the kerb, as there is on nearly every other kerb in London. In this one may be wrong, and does not quite remember. All that we can find of flowers in Fleet Street is a paragraph or two in its papers printed there, in which such mere things of nature have occasion to be named. A few lines in late winter will tell us that there are flowers coming to Covent Garden from the Scilly Isles, and in another place one reads of the flowers that decked the table of Countess A. at the fashionable dinner that she gave in her mansion in the West End the other night, and of the others that she wore in her hair with such effect that she is considered to have 'looked very handsome in a pale blue gown'—as we may be sure she did. That is all the business that Fleet Street has with its sister of the early morning work, the Covent Garden that my friend has bought.

And see the difference in the meaning of the two! What is there worldly about this Covent Garden? Only a little buying and selling at a fair profit such as heaven itself would freely sanction, honest labour having been done all

round; and they are so imbued with the good purpose and bountiful method of kind Nature in this Garden of the town that the sellers there on a sunny morning, seeing the stranger watch them, will sometimes make him a present of a basket at their hands, filled with something nice or good from distant fields; or at worst they will sell it to him at the traders' price, or a trifle less. They certainly did those things when first I prowled in Covent Garden, and they seemed there to have acquired, from the Nature in whose simple goods they deal, some of that generosity which now is rare enough in towns. Here to this market in the very heart of the roaring Metropolis, in these early morning hours when life comes into the world again after a little fitful slumber, there come tumbling, rumbling in, great wagons laden with all the best that the fields and gardens in their seasons can give. There are beautiful flowers of every tint, luscious fruits, and the coarser vegetables-everything that can be bought from a farthing to a pound; and all these things that please and benefit come from the soil, from plain Nature. Here in the shortest contemplation we see the splendour of the earth in its powers for reproduction, and we see also the needs of London and the people of other parts who feed from it calling up the best of everything from every quarter of the There is a splendid contrast in it all between the worldliness and the human demand of the people here and round about, and on the other hand the work of simple Nature to give them what is needed; and there is some pathos in the contrast too. So indeed this Covent Garden on the summer morning is one of the sights not of London only, but of the world, for those who have eyes to see such things; and it will make an odd reflection to them, if they come to inquire who was Sir Covent or the John Covent, as might be supposed, who gave his name to this Nature mart, as men give names to bits of London, that there was no person of the name of Covent concerned with it, but that once upon a time it was not a Covent Garden, but a convent garden in the days when it was the property of priests, and hereabouts was the garden and the burial-ground in which the nuns of those early times did 'bury their dead out of sight.' This explanation is simple and reasonable; but still it remains as an odd coincidence that what was the garden of the nuns should become, not through any borrowing of the name, the very real and necessary and splendid fruitgarden of the great city where the folks no longer take their vows and pray their way through solemn lives.

* * *

Three millions of sovereigns! It is a goodish price. The soil of London is precious stuff. Once, when I was looking and wandering round about the down-town end of Broadway in New

York, being in the neighbourhood of Wall Street, where so much of the American financial business is carried on, some of the money men of the quarter explained to me with a certain pride that there before me was quite the most valuable land on earth. There are some slummy bits of New York, as there are of London, for which one would hardly give more dollars or pounds than for those lone acres in the north of Britain; but time will work its way with them, for the strength of New York is greater even than the strength of most other cities in the value of its land, in that the city is on an island, a lump of rock which is called Manhattan Island, and, with the water all around it, can never be enlarged. All the time there are more and more people, and they all want a trifle of that precious island for the transaction of their business. It is for that reason, the one of necessity, that New York builds up and up far into the sky, instead of outward more and more, and not because it has an unearthly taste for living and working on a forty-second floor. When the white men first came to America and pounced upon Manhattan Island there were Indians there, and terms had to be made with them. It is simple tradition—the story may not be strictly accurate, but yet it is probable—that the white invaders bargained with the Indian owners of the island for full ownership and possession for a matter of twenty dollars' worth of mere tobacco. It does not seem to us now that if the whole world were turned into a tobacco-garden, and grew the precious weed for eternity, there would ever be enough grown and sold to pay for the purchase of half New York from the people who now have possession of it. One bit of this New York land, at which we were looking at the time, just so much as to hold one big building that was to be set on it and no more, had been sold for a number of dollars representing more than two million pounds of British money. One building site! And since that time I have seen the building on it, and the whole outlay is explained to have been a matter of five million pounds. That is for a little piece of land on which, if it were plain soil, you and I could not grow sufficient food to last us for a year. This bit of Broadway would be insufficient for a cow; but in a very little while as much money will be dealt in there as would buy up the whole of China. The Indians and their tobacco—and the millions and millions of pounds! The bleak acres in the north of Scotland-and that precious bit of London! These variations in the price of land which intrinsically is much the same—and if not, then the advantage is with the earth of Sutherland over the rock of Manhattan Island -are somewhat bewildering, even with all the explanations, which are simple enough in their way. Men decide to meet together to live and do their work; their gregarious system is the essence of the living scheme of things, and where they meet there is the value.

* * *

The Americans made it their first and greatest principle of investment, one of which they preach continually, that there is nothing that can ever compare with real estate for security and value, meaning the simple land of earth; and the truth of that principle is sufficiently plain since, though many things may pass away from the world, there is one that always remains while the earth itself endures, and that is the soil. It becomes the more valuable as it is made the scarcer; through the population increasing it is coveted more and more. There is a demand that is constant, but a supply that is fixed immutably. The value of London soil is so good that a man might be proud if he owned but a yard of it at a special place, and one who rents only a trifling patch for his regular purpose has privileges of high value. A little while since I was talking to a Lord Mayor shortly after his appointment to that office of high dignity, and he murmured that he lived in a house the rent of which at the lowest calculation would be fifty thousand pounds a year. Of course he meant the Mansion House in the heart of the City. There is an old church in the City, Austin Friars, for which a million pounds was offered, and refused, not so very long ago. A sum of more than three million pounds has been paid for a freehold site not far from here, which works out to something like ten shillings a square inch, and at that I think we beat New York, despite its island boundary. Could we not beat out half-a-sovereign to cover an inch of space? That being so, how nearly literally might it be said that the streets of London are paved with gold! Bits of the Strand have been sold for nearly a million Bits of the pounds an acre; and a million and a half of pounds an acre, or thirty-five sovereigns for each square foot, have been paid for pieces in Bond Street. The way in which the value of this land still goes on increasing is an amazing thing. There is an insurance office in the City whose ground once, long ago, was sold for seven thousand pounds. About fifty years back it was sold for eighty thousand pounds, and more recently was sold again for eight hundred thousand. is the same not all over but in many parts of this wonderful town; and sometimes we may think of such things, and recall that, as the historians have it in their conjectures, the very first people who saw the land of London, being the early humans who made their tools of stone, felt that they did not care for it. They may have roamed about it and lingered there for a little while, and fought the wolves and bears and the elephants even that held to unbuilt London then. But, no, the Stone Age men did not like the look of London, and they went

away. The Celtic Britons knew something better to do than that. They stayed. They made a little town of mud huts, and it was called Lakefort or Lyndyn. Land in Lyndyn went cheap just then, and in a natural way it had some charm of looks. There were purling rivers, There were purling rivers, leafing trees, and growing grass—sights that townsmen pine for now. Woods and forests, marshes and streams, surrounded Lyndyn then. East and west were the deep ravines of the Walbrook and the Fleet. The Celtic Britons persisted; even in those early times men knew their business well. And from those days, with little hitches in the run of history, the soil of London has gone up and up in value; and for the veriest trifle of that great land, at the whole of which the people who first saw it turned up their noses and went away, the gentleman to whom we have referred has now paid his three million pounds. In this modern age we who must

struggle and work always are, all things considered, contented beings. We bear our burden and we make provision constantly, and with the most definite system, for our own respective posterities. We, in a sublime unselfishness, are always thinking of posterity. But we too are a posterity of some who once were here, and what provision did they make for us? We have something good, no doubt; but free gifts seem few. Oh ancestors, who had a posterity to come in this twentieth-century London! But a little of that raw City land which could have been bought for your posterity at such a trifling sum! The price of a butt of Malmsey wine would have bought us land that would have given us wealth to-day, and made us proud men as we walked the City streets. There are some things for which ancestors can never be forgiven. On the whole, they seem to have been a thoughtless lot.

A KNIGHT ON WHEELS.

BOOK II.-LABOR OMNIA VINCIT.

CHAPTER XIV .- THE GOLDEN AGE.

I.

PHILIP'S life during the next ten years resembled All Gaul in that, as Cæsar puts it, it was divided into three parts. It was spent partly at a little house in Cheltenham, whither Uncle Joseph, with all his old austerity and cynicism thawed out of him, had conducted the Beautiful Lady two months after their marriage, partly at Red Gables, and partly at a series of educational establishments, ranging from a private school in the neighbourhood of St Albans, where he was initiated into the mysteries of Latin prose and cricket, to the great engineering shops of the Britannia Motor Company at Coventry.

Life at Red Gables was a very pleasant business. Philip's duties as secretary were of an elastic nature. Sometimes he wrote out cheques for tradesmen and coaxed Mr Mablethorpe into signing them. Sometimes he battled with publishers about copyrights and royalties. Sometimes he acknowledged the receipt of the letters—chiefly from seminaries for young ladies—of those who wrote to express their admiration of Mr Mablethorpe's works.

'I suppose, Philip,' said Mr Mablethorpe one morning, ruefully surveying a highly scented missive in a mauve envelope, forwarded by his publishers, that my books are read by other people besides schoolgirls; but why in Heaven's name should no one else ever write to me about them? Not that I want any one to write at all—the penny post is the curse of modern civilisation—but I could do with a touch of variety now and then. I have only once in my life received a

letter, as an author, from a man, and that was

from a pork-butcher in the north of England, who wrote to point out, most helpfully and sensibly, that I was guilty of a technical error in making my hero purchase both kidneys and bacon at the same shop. I should like to get a lot of letters like that. They are extremely valuable. But what do I get? Letters by the score from schoolgirls—sometimes from a syndicate of schoolgirls—all asking for my autograph, and endeavouring to find out, by more or less transparent devices, how old I am, and whether I am married or not! You can't choke them off. If you don't answer they write again, enclosing a stamped envelope, which hangs round your neck like a millstone for weeks. If you do, they tell all the other girls, and before you know where you are you find you have tapped Niagara. Let us see what zenana has found me out now.'

He opened the mauve envelope, and read the

letter with savage grunts.

'This, Philip,' he said, 'is from Gwendoline Briggs and Clara Waddell. You will be interested to hear that they sit up reading my innocuous works in the dead of night, after the others girls have gone to sleep. Well, I hope the head mistress catches them at it, that's all! Here you are: what did I tell you!

"We often wonder what you are like. One of us thinks you are about forty, with rather

tired gray eyes."

'Impudent minx!

"But the other thinks you are much younger than that; clean shaven, with a very firm mouth."

This sort of thing makes me quite sick. Yes.

I thought as much; they want my autograph. "Will you please send two, please, as we are not sisters, only great chums.

'Where do these brats hail from?'

Mr Mablethorpe turned back the page and

consulted the heading of the letter.

'Bilchester Abbey School, Bilchester, Hants. That's a new name to me. Throw over that directory, Philip; on the third shelf, to your right. Let me see: Founded 1897. Governing Body: The Lord Bishop of—— Quite so. Head Mistress: Miss Yes, yes. Assistant Never mind them. Gravel soil; Gymnasium; Altitude, four hundredhere we are: Number of Pupils, two hundred and seventy-three! Great Heavens! This must be stopped. Get the typewriter quickly, Philip, and take down something.

'Mr Julius Mablethorpe regrets deeply that he is unable to accede to the request of Mesdames Briggs and Waddell for his autograph. Mablethorpe had the misfortune some years ago to be deprived of the use of his hands (owing to an explosive fountain-pen), and now finds himself compelled to dictate all his work into a gramophone. Mr Mablethorpe is seventy-eight years of age, and is still in possession of a fair proportion of his faculties. His eyes used to be gray, as Miss Briggs (or was it Miss Waddell?) surmises; but he now possesses only one, having lost the other while on a visit to a Dorcas Society, together with a portion of his scalp. He has been married four times, and possesses sixty-nine grandchildren, reckoning thirteen to the dozen. For further details see Who's Who.

'That ought to choke them off,' observed Mr Mablethorpe with childish satisfaction, as he finished dictating this outrageous document. 'Now, what about this grubby epistle here? It does not smell so vilely as the first, but I bet it is from another of the tribe.'

He began to read:

"DEAR MR MABLETHORPE, -All your books

are in our House Library"

He broke off. 'I tell you what it is, Philip,' he said, 'I shall have to write a really shocking novel—something unspeakably awful. Then I shall be banned from girls' schools for ever. My circulation will probably go down by ninety per cent., but it will be well worth it.'

"My name is Elsie Hope, and I love them all. I have no father or mother, and I have just read a story of yours about a little girl who had no father or mother either. It made me cry."

'Snivelling brat!' commented the unfeeling

author.

"I have not been here very long, and I do not know many of the girls yet, so your books make splendid company. I thought I would like to tell you. Good-bye."

'Gracious!' said Mr Mablethorpe incredulously. 'She hasn't asked for my autograph! Hallo, what's this?'

He turned over the page. The letter continued, in a different handwriting-prim, correct, and

"Elsie has gone to bed. I found her writing this letter, and she showed it to me quite frankly. As the child seemed really eager to write to you, I have undertaken to finish her letter and explain the circumstances. I feel sure you will understand, and pardon the liberty. Do not trouble stand, and paruon to reply.—Yours faithfully,

"Ellen Wardale."

Mr Mablethorpe laid down the letter. 'Ellen Wardale is a good sort,' he said. 'As for Elsie Hope, she has not asked me to write to her, so I shall do so. Now, Philip, get out The Lost Legacy, and we will have a go at Chapter xiv. It is going to be a difficult bit. The hero, who is the greatest nincompoop that I have yet created, finds himself suspected by the heroine of having transferred his affections to another lady. tween ourselves, it would have been a very sensible thing if he had done so, but of course he is incapable of such wisdom.) As the story is not half over, we can't afford to get him out of the mess just yet; so this morning I want him to make an even greater ass of himself than before, and so prolong the agony to eighty thousand words. Here goes!

After this they would work steadily until

lunch-time.

Philip had other duties to perform. attended to the wants of Boanerges, and in time reduced that unreliable vehicle to quite a surprising degree of docility. He became gradually infected with the romance of our mechanical age. He saw himself, a twentieth-century Galahad, roaming through the land in a hundred-horsepower armoured car, seeking adventure, repelling his country's invaders, carrying despatches under cover of night, and conveying beauteous ladies to places of safety. He spent much of his spare time seated upon the garden wall, watching for the motors that whizzed north and south along the straight white road. (It is regrettable to have to record that many of these disregarded Dumps's notice-board.) He saw poetry in the curve of a radiator, and heard music in the whirring of a clutch.

One day, in an expansive moment, he confided ese emotions to Mr Mablethorpe. That manythese emotions to Mr Mablethorpe. sided man did not laugh, as Philip had halffeared he would, but said, 'Romance brought up the nine-fifteen, eh? I must introduce you to a kindred spirit.' And he led Philip to a shelf filled with a row of books. Some were bound in dark blue, and consisted mainly of short stories; the others, smaller and slimmer, were dark red, and contained poetry. 'There,' said Mr Mablethorpe, 'are the works of the man whom I regard as the head of our profession.

Wire in!'

Philip spent the next three days learning MacAndrew's Hymn by heart.

There were many other books in the library upon which Philip browsed voraciously. Uncle Joseph's selection of literature had been a little severe, but here was far richer fare. Philip discovered a writer called Robert Louis Stevenson, but, though he followed his narratives breathlessly, found him lacking in feminine interest. The works of Jules Verne filled him with rapture; for their peculiar blend of high adventure and applied science was exactly suited to his temperament. He had other more isolated favourites: The Wreck of the Grosvenor, Lorna Doone, The Prisoner of Zenda, and By Order of the Company, which last he read straight through twice. But he came back again and again to the shelf containing the red and blue volumes, and the magician who dwelt therein never failed him. were two fascinating stories called The Ship that Found Herself, and 007. After reading these, Philip ceased to regard Boanerges as a piece of machinery; he endowed him with a soul and a sense of humour. There was a moving tale of love and work called William the Conqueror: there was a palpitating drama of the sea called Bread upon the Waters; and there was one story which he read over and over again—it took his thoughts back in some hazy fashion to Peggy Falconer and Hampstead Heath—called The Brushwood Boy.

Only one book upon this shelf failed to please him. It was a complete novel, and dealt with a love affair that went wrong and never came right. The hero, a cantankerous fellow, became blind, and the unfeminine independent heroine never knew, so went her own way and left him to die. This tragic tale haunted Philip's dreams. It shocked his innate but unconscious belief in the general tendency of things to work together for good. He considered that the author should have compelled these two wrongheaded people to 'make allowances for one another,' and so come together at the last. He even took the opinion of Mr Mablethorpe on the subject.

Mr Mablethorpe said, 'His best book, Philip. But I read it less than any of the others.'

Then he introduced Philip to Brugglesmith, and the vapours were blown away by gusts of laughter.

(Continued on page 213.)

THE OCCUPATION OF THE TURKISH PROVINCE OF EL HASSA.

TO the loss of her African and European provinces, as the outcome of the wars with Italy and the Balkan states, Turkey must now, perforce, add that of her possessions in the hinterland of Arabia, bordering on the west coast of the Persian Gulf, where the elements of disintegration have suddenly revealed themselves, and the slender chain which for the last fortythree years linked the province of El Hassa to the Turkish Empire has been unexpectedly severed by the decisive action of the Nejd Arabs, under the leadership of Abdul Aziz bin Saoud of Riad, a direct descendant of the founder of the formidable Wahabite dynasty, Mohammed bin Abdul Wahab of Ayinah in Nejd, who flourished toward the close of the seventeenth century.

The province of El Hassa, with its capital, Hofuf, and the towns of Katif and Ojeir on the littoral, covers an area of approximately fifty thousand square kilomètres, and is inhabited principally by Mohammedans of the Sunnite sect, with a small admixture of Shiites. The total population in 1895 was officially estimated at two hundred and fifty thousand souls. After the final suppression of the Wahabite rebellion in the 'sixties, the inhabitants of Nejd again revolted, but were reduced to subjection in 1870 by Midhat Pasha, the Governor-General of Bagdad. Hassa, including the port of Katif, was then formally annexed to Turkey, and, under the title of the Sandjak of Neid, formed one of the administrative

divisions of the Vilayet of Bagdad. In 1876 the province was again in rebellion, and Nassir Pasha es Sadun, supreme chief of the Montifik Arabs, was despatched by the central Government to restore order. Nassir Pasha proceeded by sea to Hassa, taking with him Sheikh Bezih al Araer, son of the former governor of the sandjak; while his own son, Mizied es Sadun, marched overland from the Euphrates at the head of one thousand Montifik horsemen, accompanied by one thousand camels with supplies and provisions. The two forces met at the gates of Hofuf, invested the town, released the Turkish garrison which had been imprisoned by the inhabitants, and returned to Nassriyeh, after quashing the rebellion and installing Sheikh Bezih as mutessarif, or local governor, of the province. Only a few months elapsed before troubles broke out afresh, and necessitated another expedition. Nassir Pasha and his son occupied Hassa a second time, and taught the inhabitants such a severe lesson that all ideas of further struggle for independence seemed, for the time at least, to have been effectually banished from their minds. In 1884 the Sandjak of Hassa was incorporated in the new Vilayet of Bussorah, and has been administered since that date by a Turkish governor appointed direct by the central Government at Constantinople.

annexed to Turkey, and, under the title of the Sandjak of Nejd, formed one of the administrative the Turkish occupation the province has been

practically closed to European travellers. Hofuf was visited by Captain Sadler in 1819, Palgrave in 1863, Sir Lewis Pelly in 1865, and the American missionary Zwemer in 1893. usual route to the interior is by boat from Bahrein to Ojeir on the mainland, and thence by caravan to Hofuf; the distance from Ojeir to the capital being thirty-six miles. Ojeir is without a bazaar or settled population, but has a mud fort, wells, and a custom-house, which also serves as a caravanserai. Its shallow approach, protected against north and south winds, forms a suitable landing-place for the rice and piece-goods shipped in large quantities from Bahrein to the interior. The country from Ojeir to the oasis round the capital is bare desert, streaked here and there with prominent ridges of sand, and distinguished in one place by a vein of green limestone. Hofuf is encircled by palm-trees and gardens, and approached through fields of wheat and rice; as Palgrave describes it, 'a white and yellow onyx chased in an emerald rim.' The ancient town was the citadel of the celebrated Beni Kindi and Abdul Karis in 570 A.D., and is the first stage on the direct caravan route from east Arabia to Mecca and Jeddah. Like every other town and village of Hassa, Hofuf owes its existence to the underground watercourses which are the characteristic of the province. The region is capable of rich cultivation; but owing to Bedouin robbers and official exactions, most of it remains desert. The date-palm predominates, but the sidr or lotus-tree, fig, and pomegranate flourish; indigo, cotton, rice, sugar-cane, and other vegetationsuch as onions, radishes, beans, vetches, and maize are cultivated freely.

The town itself is surrounded by a mud wall about four and a half miles in circumference. The Government offices, barracks, hospital, and principal buildings form an enceinte in the centre of the town, and are approached through the bazar. The houses, unlike most Oriental towns, are widely scattered, and divided by well-cultivated gardens. In the north-west corner is an old disused mud fort abutting on to the ramparts; and the moat is now dry, and half-filled with the débris of the walls, which are not in good repair.

In the spring of 1913 the Turkish garrison, composed of the second and third battalions of the 112th Regiment of the line, consisted of about seven hundred and fifty men and fourteen guns, among which were two mitrailleuses and several heavy pieces of field artillery. Of these troops, about four hundred men, with the bulk of the artillery, were stationed at Hofuf, and the remainder at Katif and Ojeir. The last phase has been graphically described by an Arab eye-witness who accompanied the expedition:

'Abdul Aziz bin Saoud of Riad had long been in secret correspondence with the townsmen of Hofuf, who, tired of Turkish misrule and the illegal exactions of a corrupt body of Ottoman

officials, turned a willing ear to the proposals of the young Wahabite chieftain. Having collected his tribesmen to the number of six hundred, toward the end of the first week in May Abdul Aziz, unknown to the Turks, pressed rapidly forward to within five hours' march of the capital. Here he halted during the heat of the day and called a meeting of the principal sheikhs, at which several of the confederate townsmen were present. The leader made a vigorous and impassioned speech, pointing out that they were now almost in sight of Hassa, the hereditary possession of his ancestors, of which his family had been unlawfully deprived by the Turks for upwards of forty years. The sufferings of the inhabitants, who clamoured for release from the hated Turkish yoke, demanded redress. As their overlord and master, according to the rules of tribal succession, he was especially entitled to pose as their champion and protector. The ground was well prepared, and the seed already sown promised a fruitful harvest. The inhabitants of Hassa had solemnly sworn on the Koran to rise at his bidding, and expel or destroy the Turkish intruders; the townsmen were ready to receive him as their leader, but before casting the die he wished to consult the opinion of the sheikhs of Nejd. If they agreed to support him, he would go forward in the firm belief that Allah was on their side; but if they disapproved, he would retire modestly, as befitted his age, and yield to the sager counsels of the elders who now surrounded him. The speech was greeted with a subdued murmur of unanimous approval; and cries of 'Al amrak!' "At your orders!"), which ran round the assembly, encouraged the speaker to proceed. He called for volunteers—two hundred men mounted on mares-for the attack; the camels and the remainder of the force would follow slowly, and remain at a distance, but within call if assistance were required, while the attacking party went forward rapidly and prepared the way.

'The sheikhs gave their assent, and oaths were sworn and vows exchanged on the Koran. At sunset Abdul Aziz set out with his flying column, and halted in the oasis on the outskirts of the capital, about half-an-hour's distance from the walls, until midnight. Having tethered their mares, the party advanced stealthily on foot, guided by certain townsmen of Hofuf, and scaled the wall of the old fort at the north-west corner of the ramparts; the men lining up against the wall and standing on one another's shoulders till the summit was reached, where the topmost man lowered a rope to his companions, and some of the party climbed to the top of the fort. They then ran along the wall to the town gate, and, rapidly despatching the eight guards stationed there, opened the doors to their companions who were waiting outside, and entered the town. The Turkish authorities, completely taken by surprise, shut themselves up at the first alarm in the inner fort situated in the centre of the town, but failed to communicate with the military outposts in the outlying districts. Both sides remained under arms till noon on the following day, but did not

quit their houses.

'At noon Bin Saoud addressed an ultimatum to the Turkish governor, demanding the immediate surrender of himself, the Turkish officials, and the garrison if they wished to save their lives. This ultimatum was supported by the townsmen of Hofuf, who urged the mutessarif to comply, and pointed out the futility of resistance. Turks surrendered, and Bin Saoud was careful to exact from the governor sealed letters addressed to the commanders of the garrisons at Katif and Ojeir, informing them of what had occurred, and instructing them to surrender likewise. granted such of the Turks as had families a day's grace to make their preparations, but ordered the garrison and the Turkish officials to leave immediately. The soldiers were allowed to retain their rifles and ten rounds of ammunition per man, and the Turks were permitted to take with them anything they could carry. An Arab escort was provided for them to the coast, and the emigration began at once. The fourteen guns in the town, including the two mitrailleuses, were seized, together with all reserve arms and ammunition, and the cash in the Government treasury; dhows were collected by Bin Saoud at Ojeir and Katif for the transport of the garrison and officials, who proceeded to Bahrein, and thence by steamer to Bussorah; and largesse was distributed by him among the soldiers, while the officials were given a suitable sum of money for the expenses of their journey.

'The news of the occupation of Hassa without opposition and the expulsion of the Turks was duly reported in a letter addressed by Abdul Aziz himself to the Governor-General of the Vilayet of Bussorah. In this epistle the Arab sheikh observed that forty-three years ago his father entrusted the Turks with the administration of the province of Hassa for the betterment of the people and the security of their trade. Nothing had been done from that day to this, and the state of affairs had gone from bad to worse, complaints were disregarded, and the

people were oppressed by the unlawful exactions of ignorant and avaricious officials. For this reason he had taken back what his father had given. He remained the loyal and obedient servant of the Sultan; but if the Turkish Government tried to wrest Hassa from him he was prepared to oppose them.'

Thus was Hassa lost to the Turks! Can they retake it and hold it; and, if so, will it be of any service to them? At present they would seem to have neither the means nor the opportunity. The despatch of a brigade to recover the province would involve considerable expense, and a smaller force might spell disaster. The maintenance of a Turkish army in a hostile country would be, moreover, a dangerous and costly experiment. The troops immediately available for the purpose are Arab levies from Irak, and the policy of the Committee of Union and Progress Government has already alienated the sympathies of the Arab populations of Syria and Mesopotamia. The Montifik tribes are unlikely to assist them again; and, indeed, there are many outstanding questions to be regulated in that turbulent sandjak before the Government could rely on the loyal adherence of Montifik tribesmen in such a cause. The Arabs of Hassa are eminently averse to a restoration of Turkish rule; the régime has been tried for forty-three years, and has been condemned. Hassa is useless to Turkey for the purposes of conscription, and the district has hitherto contributed nothing to the dignity, security, or support of the Empire. One cannot help feeling that its retention is likely to prove a source of weakness rather than strength to the central Government, and that the Turks would do well to let it remain, as it is at present, an independent province under the nominal suzerainty of the Sultan. Bin Saoud would be prepared to accept the titular office of mutessarif, and the issue of a firman to him in the Sultan's name for that purpose would humour Turkey's amour propre. In any case, he is likely, from all accounts, to prove a more satisfactory ruler than the handful of degenerates who for the last four decades have attempted to govern Hassa in the name of Turkey, and have so signally failed.

AT BOTHASFONTEIN.

By W. G. LITT.

THE golden hues of the rising sun were already flooding the veldt with light when Louis Vanderburgh, Boer spy by necessity, ruffian by choice, yawned lazily and threw off his ragged blanket. For a moment he gazed idly at the other members of the commando lying around him before he slipped on his worn veldtschoen and strolled across to the embers of the cow-dung fire.

Necessity is the mother of invention, they say;

and certainly the ground and roasted Indian corn which he added to the water soon boiling merrily in a battered corned-beef tin made a sufficiently good imitation of coffee to wash down biltong with.

His teeth were still engaged on that exceedingly tough variety of preserved meat when the commandant sauntered up to him.

'I want you to-day, Vanderburgh,' he an-

'Yah! What is it, commandant?'

'You must get into Bothasfontein again to-day.' Vanderburgh's face fell. 'It was very difficult the last time. It will be still harder now.'

'So?' the Boer leader said indifferently.

much the worse for you, then.

'There is a great risk of being shot by the British sentries,' the spy muttered.

'It's a risk you'll have to take,' the commandant said. 'Anyway, it's the last time, for I shall attack to-morrow.

'Then why want me to go there to-day?'

'As a safeguard, Vanderburgh. Merely to make certain that the outposts will be the same to-morrow as they were when you were there

'When am I to return if I do get into Bothasfontein ?'

'Oh, you must wait until midnight to make certain there's going to be no alteration. But you'll manage to fall in with us on your way back. Unless you wave a lantern three times we shall know the outposts are the same, and attack at dawn to send the sleepy rooineks to sleep for ever. It's our last chance, for General Blackburn's column reaches there to-morrow night.

The spy nodded. 'I shall want a pony, commandant.

'You lost one the last time you went there. I can't spare another; but I'll drive you in my Cape-cart to within ten miles of the town. You must walk the rest. We'll start in two hours' time.

That was always the commandant's way, to want things done in a hurry; and so, though Vanderburgh objected very strongly to walking, especially in the heat of the day, he said nothing further. But when, later, he stood and watched the Cape-cart turn back toward the commando, he made up his mind to wait until darkness fell before attempting his dangerous task.

Perchance the little mimosa thorn-bush near by influenced his decision, for its shade was certainly inviting. At any rate, Vanderburgh lay down

beneath it and lit his pipe.

It was noon before he opened his eyes again, and saw that great lakes of water seemed to hide the distant kopjes about Bothasfontein. But though the sight of that mirage, shimmering in the midday heat, failed to deceive him for more than a moment, it did remind him of the real water close at hand.

He rose quickly to his feet, but instantly fell prone. There, with his back turned to him, sat a British officer upon a thirsty pony that stood knee-deep in the muddy pan.

The Dutchman reached for his rifle, and slowly brought its butt in to his shoulder. Very slowly and gently his finger pressed the trigger.

The sharp report of the rifle seemed to galvanise the tired figure into life—but only for a second. Then that figure grew more limp than ever, and, shuddering sideways, splashed into the water.

With a chuckle, the Boer carefully ejected the cartridge and closed the breech.

The foot that hung entangled in the stirrup was still, and no movement showed beneath the water; but, for all that, Louis Vanderburgh waited ten minutes before he waded into the pool and drew the dead body ashore.

Half-an-hour later one of the ant-bear holes beside that pool held a naked figure huddled amidst cast-off rags, and a patient pony bore southward another figure that wore the British

Gradually the mirage faded as the pony neared those gaunt kopjes that looked so deserted. Indeed, so devoid of life did those hillocks appear that even the expectant spy could barely repress a start when the hoarse challenge rang out: 'Halt. Who comes there?'

With an effort he answered, 'Friend.' 'Advance one, and give the countersign.'

One can hardly help admiring, ruffian though the spy was, the cool way in which he obeyed that order. 'Countersign?' he queried. 'How the devil can I know the countersign when I've come from Jacobsdaal?'

The sentry scratched his head doubtfully. 'I

'Haven't you been told what to do in a case like this when an officer approaches?' Vanderburgh continued.

For answer the sentry looked anxiously to his

'Of course it's no particular business of mine whether you understand orders or not,' Vanderburgh said hastily. 'But your officer won't thank you for dragging him into the matter. I shall have to report this incident to headquarters unless I'm allowed past immediately.

The private soldier looked at the threatening man in the officer's uniform; and private soldiers never do like threatening officers. So this one said, 'Orl right, sir. I begs your pardon. Pass friend; all's well.

Thus it was that, by the aid of consummate assurance on the one side and monumental stupidity on the other, Louis Vanderburgh found himself safely within the British lines.

Once he was on the inner side of those encircling outposts, no one seemed to pay much attention to him. There are always so many odd people within a war-camp-scouts, war correspondents, conductors of wagons, a thousand and one others. So he came at last, unnoticed, to the dusty main street of Bothasfontein, a road bounded by those scattered corrugated-iron shanties so typical of the Afrikander town.

A British officer just leaving a store glanced at the spy as he halted outside it. But if for an instant Louis Vanderburgh's heart beat more quickly, the sleepy eyes which looked into his lulled it at once.

'What fools all rooineks are!' he thought as he swung himself out of the saddle, and, hitching the reins over the tethering-hook, entered a shop. 'Good-day, mynheer /' Vanderburgh said, as

he closed the door behind him and held out his

hand to the storekeeper.

'Good-day, sir,' the other began, then altered 'Why, it's Vanderburgh! And in a British uniform, too!'

'Yes. I'm glad you didn't know me at once.

It shows that the disguise is good.'

'Yah. You're quite a gebore Engelsman.'
'Yes. I'—— Vanderburgh stopped suddenly at the shopman's warning sign, and turned to see the officer that he had met outside entering the shop.

Captain Peterson walked straight to the counter and stood there, waiting to be served.

Nor had he long to wait, for the storekeeper immediately moved toward him.

Dick Peterson shook his head. 'No. Serve

the other officer first. 'Please don't bother about me. I'm in no

hurry. I'll wait,' Vanderburgh hastened to say. Peterson looked at him. 'Oh no, I'll take my turn,' he said.

'But really I'm in no hurry.'

'Nor am I,' Peterson told him genially. 'Still,' he added after another sleepy glance at the other, 'perhaps, if you don't mind, I will go first after all. Thanks awfully !-- I forgot just now that I wanted a pound of Magaliesberg tobacco,' he informed the shopkeeper. 'Thanks very much. Good-day.'

The door had barely closed behind him before Vanderburgh turned on his companion with an oath. 'Coward!' he said savagely, 'your face is covered with sweat. Behave like this, and

you'll get us both hanged.'

'You can't know who that officer was.'

'I don't-nor care.'

'It was Captain Peterson.'

'Indeed! And who may he be!'

'Be? He's the British scout. Never heard of Richard Peterson?

'Yes, now you mention it, I believe I have. He looks as big a fool as the rest of the rooineks.'

'He has a great reputation.'

'Bah! amongst the rooibatjis maybe. They are all fools.'

'Perhaps so,' the shopkeeper said doubtfully. 'Yet I wish he had not come in.'

'Well, he certainly heard nothing. you'd better take me somewhere where we sha'n't be interrupted again. But, first of all, have my pony stabled, or people will wonder what his owner is doing here so long.'

'What time shall you want him again?'
'Not to-night. When I leave I shall go on foot.' Meanwhile Dick Peterson made his way thoughtfully down the street with never a backward glance from eyes in which more than a hint of steel had replaced the sleep. For, though the Boer spy had failed to recognise the British scout, the converse was very far from being true.

'Vanderburgh!' he muttered to himself. 'What is he doing here in our uniform, ch? I

must think this over with a pipe.'

That tobacco must have helped his thoughts swiftly, for at the bottom of the street he snapped his teeth so suddenly that the worn mouthpiece broke between them. 'That's it!' he said aloud. 'That's bound to be it! Well, now for headquarters.' But in a moment the elation had died out of his face as he continued, 'Ah, if only the poor old General were about! This idiot in his place hates me like poison. I'll bet he won't listen to me.'

How true his estimate of Colonel Rosskin was he learnt shortly, when he stood in the presence of that officer of small stature but immense importance.

The colonel looked superciliously at him out of jaundiced eyes. 'No time to see you, Captain

Peterson,' he announced testily.

'It's very important, sir.' 'All communications must reach me through the proper channels. You ought to know that. I had to call attention to the matter in Orders yesterday.'

'I know that, of course. But in this

instance '-

'I must apparently remind you again that any report you may have to make must be in writing, and will receive attention to-morrow morning.

'But in this case'-

'Did you hear what I said?'

'Yes.

'Then kindly pay attention. Good-day.'

Peterson drew himself up and saluted. 'Goodday, sir.'

'Good heavens!' he said to himself when he stood once more in the street. 'The ignorancethe colossal ignorance and insolence of the man! And to think of the poor old General,' he continued, 'lying, a wounded and defeated man, in that hospital over there, only waiting to be relieved by General Blackburn to-morrow! Relieved for what? Why, to go home that the papers may tear him to pieces even more than they've done already. Poor old chap, he'll have a pretty reputation when the result of this fool's blundering is tacked on to it! Not that I or any of us here will be alive to hear it.'

But, luckily, to a man of Peterson's stamp a rebuff is simply the incentive to renewed effort; and in a moment his mind was made up, and he was striding toward the market-place, where the Red Cross of Geneva flapped idly upon its pole.

'Well, Peterson,' a cheery voice greeted him as he reached the hospital, 'what can I do for you, eh? Chlorodyne or whisky-and-soda?'

'Neither, thanks, doctor. How's the General?'

'Bad. Very bad.'

Peterson's face grew grave. 'He's conscious,

I suppose?'
'Well, he's asleep now, as a matter of fact. The best thing in the world for him, too. If that sleep continues he may pull round. But if not, why '-

'He'll die, eh, doctor?'

'Hardly a doubt about it,' the doctor said gravely.

'But he is conscious when he is awake?'

'Yes.'

Peterson's eyes wandered for a moment. Then suddenly he asked, 'Is death the worst thing that can happen to a man?

That's a bit of an awkward 'Humph!

question, isn't it?'

'Would it be the worst thing that could happen to the General?' Peterson insisted.

'Ah, Peterson,' the doctor said sadly, 'we who know him so well, and realise how little he was to blame for that unfortunate disaster, may perhaps wonder if it would be.

'What's his life worth to him, doctor, if he

goes back to England now?'
'Heaven knows. Why do you ask me?'

- 'Because I believe I can retrieve his reputation.'
- 'How?

'By speaking to him.'

'But you can't do that. I've already told

you it will kill him.'

'And even if it does, does it greatly matter? Oughtn't we to put ourselves in the dear old chap's place, and act as we think he would wish? Do you doubt what that would be?

'No, I don't doubt; but as a doctor I'm not concerned with that. My duty is to try to

save his life.

- 'Beyond that you've got a grander duty-to the British arms
 - 'You forget I'm a non-combatant.'

'I don't forget. What's that got to do with it really? You're just as keen as I am on securing victory for Great Britain.'

'Ah yes, of course I am. I know I often feel inclined to tear off this wretched Red Cross band

on my arm.'

'Well, I'm waiting for your answer,' Peterson said.

'My answer! Why can't you speak to Colonel Rosskin instead?'

'I've tried to do it. He won't listen to me. Well ?'

The doctor looked steadily at the scout, and for a moment the eyes of each man burnt into the other's.

At last the doctor spoke. 'You say it is necessary?

'In my opinion it is vitally necessary,' Peterson answered slowly.

'Very well, Peterson. Come with me,' the doctor said, and led the way to a marquee.

Within the darkened tent Sir Arthur Westerhouse lay upon a little camp-bed, sleeping so quietly that Peterson thought he had ceased to breathe. But when his eyes had adapted themselves to the gloom he saw that the thin sheet covering the wasted form rose and fell ever so slightly.

He stood in silence looking down upon those pallid features whose hue matched so well the pillow on which they lay. How different that face was now from what it was that morning when he had fallen, vainly trying to rescue his column from a situation in which the very fates

seemed linked against him!

One can hardly wonder that for a moment Dick Peterson's iron resolution wavered. It seemed almost murderous to kill that poor helpless figure on the chance of a guess; for such he knew it But it was only for a moment. Then his grim jaws clenched and the lips tightened till the red of them was almost gone.

He nodded to the doctor, who stepped to the bedside and laid his hand upon the General's.

The dying eyes opened vacantly, only to contract with pain as a groan burst through the ashen lips. 'What's the matter, doctor?' he whispered, and there was a husky rattle in the voice that cut the scout to the quick.

Captain Peterson, here, wishes to speak to

you, sir.'

'Eh, who? Peterson? Ah yes.—What is it, Peterson?

- 'I've tried to tell Colonel Rosskin, sir; but he won't listen.'
 - 'Well, what—what is it?'

'There's a Boer spy in the town, sir.'

A gleam of interest, almost a sparkle, shone

somehow through the filmy eyes.

The scout gulped violently before he continued, 'I don't want him arrested, sir. I want him to be allowed to leave of his own accord. Because, sir, he must have come in to find how the outposts are placed to-night.'

'Why?

'So that the Boers can attack at dawn to-morrow.'

'Why to-morrow?' the General gasped.

'Because it will be their last chance before General Blackburn's column relieves us. They'll know all about that, of course, and realise that unless they attack before he comes, all the information their spy has acquired will be They will expect to surprise us at useless. dawn.'

'Yes, yes, I see. You want me to see Colonel Rosskin ?'

'Yes, sir.'

The General fought back a groan of anguish. 'Very well, Peterson; fetch him at once."

The scout straightened himself and walked swiftly to the tent-flap. Once outside, he turned and ran as never before.

Colonel Rosskin, in the act of mounting his pony outside headquarters, uttered, with an oath, 'Now what the'----

'The General wants you at once, sir,' Peterson

'The—the General!' the colonel stuttered.

'Yes, at once, sir. He's dying.'

It is only fair to the memory of an officer who, whatever his faults were, died very bravely the next morning, to say that he asked no more, but drove his spurs into his pony. Peterson clutched at the stirrup-leather and raced beside him.

As they entered the tent they saw that the General had struggled up in bed, with the doctor's

arms about him.

For all that death was so close at hand, the veteran looked very sternly at his deputy.

Colonel,' he began, 'I have sent Captain Peterson for you because -- because 'voice wavered and stopped. He seemed to fight for breath.

Peterson spoke suddenly, 'Because you have

given me your orders.

The General's head seemed to nod before it fell loosely, and with a shudder the body huddled back upon the bed.

It was very dark when, close on midnight, Louis Vanderburgh left the shelter of the store, and, keeping in the deepest shadows, made his way toward the outpost line. But, careful and crafty though he was, his keen eyes never saw the shadow following, that only moved when he did. That shadow halted at the outposts, and watched with a smile the Boer creep past the sentry there.

The sudden crack of the sentry's rifle cut short the smile. 'I 'eard somethin' crawlin' down there, sir,' the sentry told Peterson as he ran up.

'Oh fool'—— Peterson began. 'Never mind, though,' he continued. 'It's not your fault. You couldn't know.'

'I couldn't know, sir, as you says, 'cause I couldn't see nothin'. Did I do wrong, sir?'

'If you didn't see anything it's quite all right, as you're sure to have missed him.

'Sure to have missed him?' the sentry gasped. 'Yes, yes. Never mind, though; you won't understand.'

If Captain Peterson erred in his surmise one can hardly blame him, especially if one takes the trouble to study the butt registers of the regiment to which Private Jones belonged. But doubtless the soldier's ears were more accurate than his eyes, for his bullet had sped truly enough to a

billet in the spy's thigh.

Out there in the darkness, only some thirty yards away, Vanderburgh lay fighting back his groans as he ripped the British puttee off his shin and bound it tightly about his thigh. But when he tried to rise and continue his journey, the agony of the wound held him bound to the spot where he had fallen. He gave up the effort presently, and, concluding from the slight hæmorrhage that the actual damage was small, composed himself to await with what patience he might the oncoming of the dawn and the Burghers.

That dawn came at last, filtering like a gray ghost through the shadows; and with it other ghosts came creeping, taking the shape of men as the light grew stronger. Rather late for the attack, the spy thought as he strained his eyes to watch them. Still, he chuckled to think that even so they were yet in time, for no warning shots sounded from the British sentries. A brooding silence, as of death, seemed to hang over everything.

'What fools those rooineks are!' Vanderburgh

muttered.

Even as he did so a rifle-shot rang out.

The spy rubbed his ears. Somehow that report seemed to have the double knock-knock of the Mauser! Somewhere close at hand a bee had buzzed past him! Suddenly he leapt to his feet, heedless of the pain in his thigh. This time the bee had torn itself through the sole of The rooineks were awake, and firing his boot. at him! Again that double knock-knock. He screamed aloud. It was not the rooineks. No, no; it was the Burghers who had fired. Frantically he waved his hands to that line of men now crawling so close to him. They took no notice, and he started to run toward them.

But the bearded men behind the boulders had seen British officers waving on their men before. Did not British officers always stand up to be killed, and make very good targets?

Vanderburgh paused suddenly as he realised the effectiveness of the disguise he wore. Then, with a scream of fear, he twisted about, and ran before the spitting Mausers back toward the outpost line. Stumbling and gasping, he topped that rise where yesterday he had lied to the sentry.

What lie, if any, lay ready to his tongue to explain whence he came no man will ever know. For no outpost or firing-line met his haggard gaze.

The place was absolutely deserted!

He gave one wild, backward glance, to see a Boer rise to his feet and sight a rifle at him; then he fled again. On he swayed, whither he hardly knew or cared, so long as it was away from the death behind. Onward across the donga and up its farther side he fought his way, tripping amidst the rough rocks that strewed the steep ascent. And then at last he saw the khaki figures he longed so fervently to see, and ran toward them shricking.

The rattle of Lee-Enfields answered him. Blood was streaming from the wild, gesticulating figure as it turned from the blaze of fire and started backward, panting. That bursting brain never realised that Lee-Enfields were speaking behind and beyond the Mausers. Those throbbing ears never heard the echoing shout with which the British infantry drove steel-shod against the Boer rear. Those bloodshot eyes never saw the Burghers, caught between that force and the new outpost line, turn to flee. Yet that much at least he might have known before a Mauser bullet drove through his brain.

There is little need to tell the result of the surprise to any of the British race. History books can tell us that, and how General Westerhouse, lying at the point of death within the hospital at Bothasfontein, yet dragged himself from that brink to act on information which he had received, and lay the trap which proved the turning-point in a long series of disasters.

Good news, they say, never kills; and hope and success are perhaps better medicines than any contained in Royal Army Medical Corps'

chests.

We all know how Sir Arthur recovered, and how he reaped yet other victories. But most of all we realise how unfair and monstrous was that verdict which, in our haste and ignorance, we passed upon the reverse that forced him to fall back on Bothasfontein. Strive though he may, and as he frequently does, the Field-Marshalfor such he now is—can only remember vaguely that he was told something by Captain Peterson. How or why he made those dispositions which the scout explained to the late Colonel Rosskin he does not know. But that he did so there can be no doubt, for the only two men who heard him give those orders say that he did, and he cannot question the word of the doctor or of Captain Peterson.

THE MONTH: SCIENCE AND ARTS.

ELECTROLYTIC TREATMENT OF SEWAGE.

THE economical, effective, and hygienic disposal of sewage is a problem of importance, as every community is required to dispose of sewage in an innocuous state. During the past few years many improved methods for dealing with this waste material have been devised, and the electrolytic treatment has recently received considerable attention. An English inventor has elaborated a system which, while simple and inexpensive to install, is thoroughly hygienic, and as power is generated during the treatment it is also remunerative. The installation includes a tank, called a regulator, divided longitudinally into two sections, which is placed at the outfall of the main sewer. Here a steel grating serves to arrest the passage of wood and other solid matter. Opposite this grating each section is fitted with a sluice-valve, through which the liquid flows in a graduated stream. From the regulator the sewage passes over a wheel of overshot or undershot type, to which a dynamo is coupled. In passing over the wheel the matter in suspension becomes broken up, and then passes into the main tank, where the electrolytic treatment takes place. The two compartments are charged with filter-plates, the filtering material being coke. In the first compartment there is a sump where the solid matter collects, the liquid passing into the second, where it is subjected to an electric current transmitted from the powerhouse. The passage of the current completely sterilises the liquid, which in its purified state flows into another tank or balancer, where sufficient head is provided to enable it to gather force to drive a water-turbine, which is coupled to generators in the power-house, and the liquid is then permitted to escape either into the river, stream, or sea. The solid matter or fetid sediment, which is collected in the sump, is likewise rendered innocuous by the current, and removed periodically. This sludge can be submitted to further treatment for the extraction of grease and other constituents, pressed and converted into fuel, or put to other uses. The electrolytic action is so completely effective in its sterilisation that there is no danger of pollution from the liquid that is run off. The process has the great advantage that there is no possibility of secondary putrefaction. A combined sewage and power station is a somewhat remarkable combination; it is an illustration of the ingenuity of modern invention.

ECONOMICAL HOUSE-HEATING.

Though steam-heating is universal throughout the American continent, it has never been fully appreciated in the British Islands, where a blazing coal-fire is considered so cheerful and pleasant. Unfortunately the Britisher pays dearly for his love of the fire. Even with the most scientifically designed grate there is a considerable waste, as the heat escapes up the chimney; and although the firebrick backing of the grate, which absorbs a large proportion of the heat, reflects much of it into the room, it also radiates an appreciable percentage through the bricks behind. The utilisation of this waste heat and a means of making the back brick perform a more useful purpose has been the object of considerable research, as the waste heat is sufficient to warm three or four rooms. The latest improvement comprises a combination of the favourite open coal-fire and steam-heating, the latter being utilised in the adjacent rooms. The plan involves the fixture of a horizontal or vertical diffuser or distributor at the back of the fire, in reality a hot-water boiler, somewhat similar to that employed for heating a greenhouse. From the fire-grate attachment hot-water pipes extend to small steam radiators fixed in the adjoining rooms. When, for example, the sitting-room fire is alight, a hot-water circulation is set up between the diffuser and the radiators. The water, as it is heated, passes from the heater at the back of the grate through the radiators on the lower floor, rising to those in the rooms above, and then returning to the boiler. In its broad principle the installation is similar to the thermosiphon cooling system used on motor-cars, except that its object is exactly the opposite. The heating service comes automatically into operation directly the fire is lit, and continues while the heat is maintained; no more fuel is consumed, and there is no interference with the normal working of the fire-grate; while, for the simple reason that the apparatus is not visible, it is not unsightly. The invention should appeal to householders as an economical solution of the problem of how to heat more than one room without increasing the fuel bill.

A SAFE GAS-LIGHTER.

The pocket automatic lighter, which creates a spark by flint and steel to light a benzine or petrol wick, is familiar to all. In view of its convenience to the smoker, it is not surprising that a similar idea should have been evolved for lighting the gas. The little tool resembles a large safety-pin in its general design, and works upon a very similar principle, the free end of the pin being moved over a small cross-piece, creating a spark. The free member is pressed by the fingers, and when released it flies back under the action of a spring to bring about ignition. In this manner the incandescent burner or the stove can be ignited in an instant in perfect safety, or a gas-burner lit in a gust of wind. As no flame is produced there is no such danger as may arise when a lighted match is discarded. The little device, which can be hung upon the wall, never gets out of order. It is a safe igniter for a child to use, as there is no risk of clothes being set on fire.

ELECTRICALLY HEATED GLOVES FOR MOTORISTS.

It would appear as if the motorist is to become the most pampered traveller on earth. scuttle-dash protects his body and chest from the wind, the side-door is a preventive against draughts, goggles are a guard against insects and dust, and now he is given electrically heated gloves to keep the blood in circulation through his hands while gripping the steering-wheel. Needless to say, this is perhaps one of the greatest of boons, especially in countries where a low temperature prevails in winter. It is scarcely necessary to remark that this latest comfort hails from the United States, where in some districts taking the wheel in winter is an unenviable task. The first move in this direction was a wheel having a hollow stem and rim, through which the exhaust gases were circulated; but this was clumsy and somewhat of a makeshift. Then came the electrically heated wheel, which is far neater and more satisfactory. The radiation of warmth is accomplished by two distinct methods. In one the glove itself is heated by means of units coiled around the fingers. On the inside of the index-finger and the thumb there are two contacts. The rim of the wheel at two places is fitted with short segments of metal which are connected to the storage-battery lighting system. When these two segments are gripped by the gloves the contacts establish a circuit, the fine coil units around the fingers become heated, and the fingers are kept in a warm glow. When the hand becomes too hot the motorist does not move a switch to cut off the current, but merely moves his hands to grip a non-metallic part of the wheel. The second device is a modification of this, since some motorists prefer to grip the wheel with the bare hand. In this case the segment of the wheel on each side is bound with a small heating coil which is continuously energised. By gripping these sections the hands are kept warm and active so far as the palms and the inner face of the fingers are concerned. Here again, when the hands become uncomfortably warm, one has only to grip the wheel in a different spot where heating coils are not provided. volume of current consumed is extremely small but highly effective.

A FOOT-OPERATED VACUUM-CLEANER.

The degree of ingenuity which is being manifested in connection with vacuum-cleaners for the home is remarkable, and serves to indicate the popularity of this domestic appliance. The majority of such implements operate on the bellows system, the bellows being worked by one hand, while the other manipulates the dustextracting nozzle. But, unfortunately, handpumping is somewhat fatiguing, as a little experience soon proves. One inventor, appreciating this drawback, has effected an improvement by which both bellows are worked by the feet, with the minimum of exertion. The device is really a double bellows, disposed longitudinally, with the small ends facing. operate the implement one merely stands upon it, with one foot upon each of the bellows, and these are worked by moving the body slightly to and fro. It is a seesaw motion, but when performed regularly maintains a steady and continuous suction action. The appliance occupies small space, and is probably the easiest and least exhausting home machine to manage.

FIRING LOCOMOTIVES MECHANICALLY.

The increase in the size and power of the locomotive is rendering the task of the fireman more and more exhausting. In fact, further development is restricted by the physical capacity of the man who has to keep things going, inasmuch as an engine which is not stoked adequately to maintain its power is wasteful. In order to lighten the task of the fireman, several efforts

are being made in the direction of mechanical stoking. A large and powerful mallet of the 2-6-6-2 wheel classification, built in the United States, has been shipped to the South African railways for experimental purposes, and to ascertain just what can be achieved by this method of firing. The system incorporated is that known as the 'Street.' Although the fireman is spared the fatiguing task of shovelling coal from the tender to the furnace, yet he has to keep a small crusher machine supplied. This crusher is placed on the tender, at the mouth of the shovelling door, and is driven by a small engine placed behind the brake pillar. The object of the crusher is to reduce the coal to a uniform size. After being crushed, the coal drops through a chute into a small receiver also placed on the tender, beneath the footplate. Here it is picked up by a small bucket conveyer, and carried forward and upward through a pipe to a hopper above the furnace-door on the engine, where it is discharged, the conveyer continuing its passage down a second pipe under the footplate and back to the receiver. The coal is injected into the fire-box through one or all of three pipes disposed so as to throw the coal where desired, the injection being accomplished by the aid of steam. The conveyer is worked by means of another small auxiliary engine which is placed above the hopper on the engine, while the force of the steam-jets is controlled by means The locomotive is to be subjected to exacting tests to ascertain the relative advantages and defects of mechanical stoking. Although the fireman is spared the actual work of slinging the coal from the tender to the furnace, he has to keep the crusher well and continuously supplied. One great objection to the invention is the noise created by the running of the auxiliary machinery, which in some quarters is maintained to be a decided drawback, as it renders the communication of orders between the fireman and the driver extremely difficult. Moreover, as the attention of the stoker is confined to feeding the crusher and standing with his back to the driving direction, he is unable to give the driver much assistance in reading the road.

HAS THE SAFE AEROPLANE ARRIVED?

Considerable interest has been aroused by the announcement of the new Wright invention for automatically ensuring the transverse stability of aeroplanes. The device is exceedingly simple, and the first machine which has been built with a modified example of this stabiliser incorporated has proved highly successful. The essential feature is a pendulum. This is connected with a three-way valve, which by its movement either admits, expels, or locks a charge of compressed air in a servomotor, a tank of compressed air serving as a reservoir for this purpose. The piston of the servomotor is connected to a wind-

lass by a rod working in a slot. When the piston moves, owing to the inclination of the pendulum, there is a pull on the cables which actuate the warping mechanism of the Wright machine. The movement of the pendulum, however, is restricted within certain limits in either direction by means of stops. The pendulum has a decisive action. Directly there is a disturbance it swings to the utmost extent of its travel, so that just the same amount of counteracting force is exerted when equilibrium is threatened by a slight puff of wind as by a heavy gust. A similar apparatus and method of working is also installed for the maintenance of longitudinal stability, with the exception that no pendulum is introduced. The device is in its infancy, and it is yet too early to express an opinion as to its efficiency. The machine which the Wrights are using is fitted with an apparatus which, though achieving the selfsame end, differs considerably in detail from that patented. There is no doubt that success to a very appreciable degree is dependent upon the skill of the Wrights in the handling of their machine, and whether it will prove quite as successful in the hands of a stranger remains to be proved. Undoubtedly further experiments will be conducted with the apparatus, because the invention is generally regarded as possessing great possibilities.

A SAFE EXPLOSIVE.

No small interest has been created in mining and other circles where explosives have to be used by a new blasting agent known as 'ergite.' In the preparation of this explosive no nitroglycerine is used, the main ingredient being a byproduct obtainable in almost unlimited quantities, the manufacture consisting merely in mixing the ingredients, a process which can be carried out easily and with safety at the point where the explosive is to be used. As the ingredients are non-explosive, transportation by rail or water is no more difficult or dangerous than that attending ordinary merchandise, so that 'ergite' can be shipped at ordinary rates. As a very small quantity of fumes is emitted, and they are less noxious than those incidental to nitro-glycerine, headache is not experienced in working with 'ergite.' The explosive is frost-proof, does not deteriorate or become more tender from prolonged storage in any climate, and, not being affected by moisture, it can be used under water, and even after prolonged immersion will fire instantly. It is cheaper than any of the nitro-glycerine groups, and will do as much work as an equal quantity Being plastic, it can be pressed into a borehole of any shape without difficulty, and, not being elastic, it does not spring back like nitroglycerine explosives; therefore, as it finds the very bottom of the hole, proportionately more rock is cut out. Nitro-glycerine compounds are somewhat dangerous when handled by the inexperienced farm-hand, and for this reason explosives are not

meeting with the widespread favour they deserve in farming operations; therefore 'ergite' should prove useful in agriculture.

PANAMÁ, AND WHAT IT MEANS.

Mr John Foster Fraser has a varied record as a globe-trotter, having cycled round the world; journeyed by train, boat, and sledge through Siberia and across Manchuria when it was closed to strangers; and having been frequently over Europe, the United States, and Canada on journalistic missions. One of his more recent journeys has been to the Argentine and across South America. He has written a bright and informative book on Panamá, and What it Means (Cassell), which enlightens the reader regarding the history and methods of construction of this great canal. The commander-inchief of the huge industrial army which has made this possible is Colonel Goethals, chairman of the Canal Commission and chief engineer. He has been compared to our Lord Kitchener in some of his methods. His will is law, and the work has gone forward under militarylike discipline. It is expected that the total cost of the canal will be upwards of eighty million pounds, a vast expenditure, the results of which are quite effective as compared with the millions previously sunk in swamp and jungle under the French scheme, which helped to ruin thousands of small investors. This progress has been achieved as the result of careful preparation, the passing of the necessary legislation, the securing of legal transfer of the French rights, and arrangements made with the Republic of Panamá for a zone in Panamá which should be United States territory. The United States has now possession of a strip of land ten miles wide and running forty miles north to south-east from sea to sea. The distance from deep water to deep water is fifty miles, which may afterwards be negotiated in from ten to twelve hours. The sixty thousand persons in the canal zone have been fed like an army in the field, and twice a month an armoured train crossed the isthmus laden with bullion to pay Almost as wonderful as the skill the workers. and science shown in making the canal has been the banishment of yellow-fever and other diseases from the American zone. War was declared against the mosquito, marshes and pools were treated with kerosene, the house-fly as a spreader of typhus was kept down, and the amount of quinine required by white men was immensely reduced. Where the French employes had died like flies, the death-rate has been reduced to twenty-five per thousand a year. To accomplish this a staff of fifteen hundred men has been necessary, and an expenditure of two hundred and fifty thousand pounds a year. This result, in a heavy, languorous, sickly atmosphere so enervating to the white man, means much, and shows the practical progress made in the study of

tropical medicine. It was reported that the first passage of the canal in 1913 was made by a small steamer which originally belonged to the old French Panama Canal Company. If so, this was a delicate compliment to France, which made the first attempt to cut the canal. There will be great practical progress in the lessening of distances. By the Panamá Canal the trip from Liverpool to Chili will be reduced by three thousand miles, from New York to San Francisco by eight thousand five hundred, and from New York to Australia by four thousand miles. It may be expected, also, that South America will receive a large European population and great commercial impetus. There was a paper on the making of the canal by the Hon. Mrs C. G. Murray in our 1912 volume; and in 1913 there appeared articles on the Panamá Railway and on 'A Remarkable People at Panamá' (the San Blas Indians) by Mr W. B. Lord.

To Correspondents who wish fuller information regarding new inventions mentioned here, addresses will be furnished, when possible, provided a stamped and addressed envelope or post-card be sent to the Editor, 339 High Street, Edinburgh.

NIGHT IN AUSTRALIA.

A moment's blaze on the mountain crest, A paling flush in the painted west, Gray shadows over the green vale cast, A deepening gloom, and the day has passed.

The earth-light fades on the southern hills, A sudden stillness the wide world fills, The breath of the evening breeze blows keen, And night, dark night, envelops the scene.

Not a sound save the howl of a restless dog, No light but the glow of a burning log Where the great gray gum-trees solemnly stand, Like sentinels guarding a silent land.

From north to south, from east to west, From pearl-strewn seas to the pelican's nest, O'er mount, and forest, and fertile plain, There is peace, calm peace, in that vast domain.

Not a jarring note in Nature's breast,

The hush of a land at perfect rest;

But through the still night the storm birds fly

From a crimson cloud in the northern sky.

NEVILLE BOSWORTH.

*** TO CONTRIBUTORS.

1st. All communications should be addressed 'To the Editor, 339 High Street, Edinburgh.'2nd. For its return in case of ineligibility, postage-stamps

should accompany every manuscript.

3rd. To secure their safe return if ineligible, ALL MANU-SCRIPTS, whether accompanied by a letter of advice or otherwise, should have the writer's Name and Address written upon them IN FULL.

4th. Poetical contributions should invariably be accompanied by a stamped and directed envelope.

A MARRIAGE OF CONVENIENCE.

By CHARLES D. LESLIE.

CHAPTER I.

'WELL, gentlemen,' said the King, 'what do you advise?' But, though he waited for a reply, mutely interrogating in turn each of the three men who sat with him at the Council Board, none came. There seemed a reluctance among the triumvirate, popularly supposed to rule Saarland, to break the silence.

King Henry struck the table with his open hand. 'What the devil! are you all dumb? Usually I get more advice than I seek.—General,

what have you to say?'

Prince Hannemann, the old and grizzled Commander-in-Chief, who loved Henry as a son, sat frowning and rubbing his shaven chin. Suddenly his clouded face broke into a smile. 'My opinion, sire, is best expressed in a familiar quotation which I have just recalled to memory: "Timeo Danaos et dona ferentes." For "Danaos," translate not the Soldavians, but Queen Margaret. I distrust the Italian woman, and never more than when she writes proposing friendliness for Saarland and her King. I would rather see your Majesty marry a princess of any other nation than Soldavia.'

'That is your advice?' Henry spoke in a tone of irritation. He was the most undiplomatic of kings, and his face was almost invariably an open book to read. Clear was it to see the General's words displeased him.—'What say

you, Chancellor?'

'The question in this case is one for your Majesty to decide,' said Prince Braken, Chancellor and Prime Minister, suavely. 'Your Majesty is seated so firmly on the throne of your ancestors and in the hearts of your people that if this suggested alliance with Princess Stephenie of Soldavia pleases you, it will please them.'

'What say you, Count?'

Count Zunger, to whose skilful control of finance Saarland owed much, answered promptly, 'I approve, sire. The Princess is rich—indeed, wealthy. From the monetary point of view you could not make a better choice.'

'You are in a minority, General,' the King

pointed out.

'It doesn't matter if my views are those of the minority or majority,' bluntly answered the old soldier. 'I can see your Majesty's mind is made up.'

No. 171.—Vol. IV.

'I confess Queen Margaret's overtures, though totally unexpected, appeal to me. The Princess is pretty. I saw her twice when in England last June: once at the Opera House in Covent Garden, and once at a place—I forget the name—where a polo-match was being played. We were not introduced, but we looked at each other from afar. And I think, gentlemen,' the young King smiled ingenuously, 'that the Princess prompted this letter—that I made a conquest.'

'It is very probable,' flattered the Chancellor. 'H'm!' said the General; 'perhaps Princess

Stephenie made one also?'

'Faith, no,' answered the King frankly. 'I am heart-whole. But marry I must, and the choice for a king is limited. I naturally prefer a pretty wife to a plain one.'

He spoke aggressively at the Chancellor, who had been long strongly advocating a marriage with a certain Princess who was plain even to

ugliness.

'An alliance with Mazzara,' said Prince Braken, 'would, diplomatically, suit us even better than one with Soldavia. The war was only twelve years ago. Old animosities will be awakened.'

'Is it wise or unwise, this projected alliance?' the King asked the Minister of Finance. 'State

the facts, and sum up the matter.'

'For forty years there has been enmity between Saarland and Soldavia, and long-standing points of difference kindled into war in 1900, when our late King Henry reigned over us, and King Frederick over Soldavia. The war was short, the issue decisive. Our army was quickly mobilised, crossed the frontier, and at Luzon totally defeated the Soldavians. Their Crown Prince fell in the final charge of the Soldavian cavalry. King Frederick escaped, to blow out his brains rather than re-enter his capital a defeated commander. Medena capitulated, and peace was signed. The Kaiser'——

General Hannemann gave utterance to a savage grunt. The Peace of Medena was a sore subject

with him.

'Intervened,' continued the Count. 'Soldavia secured very favourable terms. We received a small indemnity, but not a rood of land, and the two nations have never resumed diplomatic relations. Since the peace, Soldavia, though

[All Rights Reserved.]

MARCH 7, 1914.

still nominally an independent nation, has become virtually a German province. Queen Margaret, the King's second wife, Regent for her son Paul, now fifteen years of age, calls the Kaiser "Soldavia's best friend;" and Soldavia, sure of Germany's support, does not trouble to keep in repair the fortifications she erected against us. And now Queen Margaret writes a friendly letter suggesting a marriage between the late King's niece, Princess Stephenie, and our King Henry, and simultaneously a renewal of diplomatic relations and a readjustment of the Customs duties between the two nations. It would certainly be an advantage to us commercially if Soldavia were a friendly and not a hostile neighbour; moreover, the Princess's dowry would include the silver-mines at Fürst, which are adjacent to our frontier, a very valuable addition to the natural resources of Saarland. The only disadvantage is the possible hostile attitude of those Soldavians who have not forgotten Luzon.

The Minister of Finance paused, and then prepared to continue. He was evidently about to enlarge on the subject; but the General struck in impatiently, 'What's the good of talking further? The King desires a favourable answer to be sent to Queen Margaret. We're wasting time.'

'I think an interview on neutral ground,' said the King, 'might be arranged; that doesn't commit us to anything. I can draw back if I

want to.'

'But you won't,' prophesied the General.

CHAPTER II.

THE suggested interview duly took place at Nice, where Queen Margaret had a villa. King Henry travelled openly to the Riviera, and appeared in the Casino at Monte Carlo; but his visit to the Queen Regent of Soldavia was conducted with the utmost secrecy. He was received by Colonel Talc, the Queen's Private Secretary, and presently—his suite of three gentlemen waiting without—was ushered into a drawing-room where the royal ladies awaited him.

Henry was almost as eager to meet the Queen as to meet the Princess. Rumour declared her the inveterate enemy of Saarland and its ruler, and the only reason he could conceive to explain her volte face was that the Princess had fallen deeply in love with him. The King was of a romantic temperament, a lover of fair women; and one glance at Stephenie as he entered confirmed report, her photographs, and his somewhat distant views of her in London, as to her good looks.

The Queen naturally claimed his first salutation. There was little of the queen about Margaret, though born in the purple in Italy. She was forty-five, a plain, thin, dark woman, with a snub nose and colourless eyes; but behind them lay one of the shrewdest brains in Europe. Soldavia owed much to her, and cordially and respectfully disliked her, making grudging ac-

knowledgment that she never spared herself, and did her duty to the orphan niece she mothered. They even granted she might love her son Paul; certainly, if she had any affection to bestow, he absorbed it. Her greeting to the royal visitor was formally and impeccably polite.

'Madame,' said the King, bowing over her hand and respectfully touching it with his lips—it was the coldest hand he had ever kissed, he told the General later—'it gives me infinite pleasure to accept your invitation. I have long wished this opportunity'

wished this opportunity.'

Margaret suitably and ceremoniously replied,

and Stephenie was introduced.

Her hand, which the King kissed with more ardour than Margaret's, was delightfully soft and warm to the touch, and her voice pleasant to the ear as she murmured a conventional greeting. Henry was agreeably impressed. Stephenie, at close quarters, conquered at a glance. Her eyes were blue, clear, and candid; she had regular features, a small red mouth, and golden, silken, luxurious hair. She had more than beauty, a certain mystical allurement, unconsciously possessed, unconsciously exercised. There was something elusive about her; she possessed that strange nunlike quality that clings to some girls like a cloud, which seemed to set her apart, and made her infinitely more desirable.

Straightway Henry decided that he would

marry the Princess.

They sat down and drank tea and talked commonplaces, just like folk of less exalted rank; but King Henry was not one to waste time, and in a few minutes he and Stephenie were ostensibly admiring the view from one of the windows, while Queen Margaret remained at the tea-table.

'Princess,' he said, in his most seductive voice, 'you know the object of my visit? Dare I hope that I am acceptable to you as a suitor?'

Then King Henry received a painful shock.
Stephenie, perfectly composed, replied calmly,
'I am willing to marry you. My aunt says it is
for the good of Soldavia. But it would be a
marriage of convenience. I was to marry Karl;
I loved him as a child, and I shall never love
anybody else, least of all one of our former
conquerors.'

Karl was her cousin, the Crown Prince, who fell at Luzon when Stephenie was ten years of

age. He was still the national hero.

But if Henry was discomfited, he rallied quickly. 'Never is a big word,' he said. 'We belong to the present, you and I. The Crown Prince and the war belong to the past. Even your aunt, who has so much to forgive, is willing to let the past be buried. Will you be more hostile than the Queen Regent?'

'I am willing to obey my aunt and give you my hand. My heart I could not give, even if I

desired.'

'At least, then, I am favoured above other men. You declined to do as much for Prince Augustus and the Grand Duke of Selbeck-Walstein—so rumour says,'

'My aunt allowed me to refuse them. She has desired me to accept you. Myself, I do not wish to marry at all.'

Henry glanced covertly at the slight, dark figure seated at the tea-table at the other end of the room. 'She desires the marriage, then?'

'I wonder why?' he mused aloud.

'Yes.'

Stephenie shook her head. 'I do not understand politics,' she said. Had she been plotting to fascinate she could not have chosen a more seductive rôle. Her apathy, her placid acceptance of her fate, puzzled the good-natured but somewhat vain-glorious King, accustomed to facile triumphs over feminine hearts. He went away in love; not for the first time, it is true, but the first time his love had fallen upon a woman he could marry. The triumvirate were bidden to push the matter forward; and very shortly afterwards Europe learned that the King of Saarland was to marry the niece of his father's old foe, the King of Soldavia.

The two nations chiefly concerned received the news with huge surprise and moderate approval. Some were pleased at this healing of the old feud; others shook their heads. There were Saarlanders who said nothing good could come out of Soldavia, and Soldavians who said the same of Saarland. On all sides wonder was expressed at the attitude of the Queen Regent. Whoever would have thought that she would consent to the alliance? It passed belief; and the conclusion was the old discovery that women, whether queens or commoners, were incomprehensible.

Following the formal announcement of the engagement, King Henry went on a visit to Queen Margaret at the royal castle at Istafel, in Theracia, the northern province of Soldavia. He left after a skirmish with the triumvirate. Prince Braken desired the visit to take place on neutral ground, and suggested Nice; but Queen Margaret's physicians declared that the Queen, who was a little run down, needed the mountain

air of Theracia to recuperate. The General's objection was, frankly, that it was dangerous to go; but Henry overbore all opposition.

Part of Theracia is flat and fairly fertile, but as the traveller approaches the mountainous region it becomes more and more barren. The railway ends at Haave, and a thirty-mile ride on horseback is necessary ere the castle, originally a fortress built to overawe the Syvians, is gained. It stands, an outpost of civilisation, surrounded by countless miles of rock and plain and forest. Farther north, in the mountains, dwell the remnant of the Syvians, a race distinct from the Theracians. The region they inhabit lies part in Soldavia and part in Saarland, and to this day they pay only a nominal allegiance to their rulers. Formerly their raids were impartially distributed between both countries; but for thirteen years they had mended their ways. Just before the war the two kingdoms combined to send a punitive expedition against them, which carried fire and sword into their remotest fastnesses. It was a savage reprisal for savage crimes, and effectually tamed the remnant left. They clung close to their inaccessible haunts, and left the cattle of the neighbouring farmers severely alone.

The castle, being medieval, was unsuitable for the requirements of modern royalty, and was occupied by the garrison. Queen Margaret had built a hunting lodge by it, and here she received King Henry and his small suite.

General Hannemann remained in Soult, the capital of Saarland, alert, suspicious, watching the wires. He feared 'the Italian woman' as he feared no man living. 'She'll kidnap you,' he said; 'she's at peace with the Syvians, and she'll bribe them to carry you off. But let her beware. I can mobilise the army in four days; in two more three columns, each of a hundred thousand men, will be at the walls of Medena. Our guns will thunder on the town, our aeroplanes drop bombs over it. Neither Germany nor Europe shall save it if she deals treacherously with you.'

But King Henry only laughed. (Continued on page 230.)

A ROYAL ARCHÆOLOGIST.

By L. A. M. PYNSENT.

QUEEN ELENA, the much-loved Queen of Italy, has long been famous for her good works, for her fearlessness in danger, as testified by her visit to Messina at the time of the last earthquake, and for love of her adopted country and its people. Her fame is great even as a good housekeeper and careful mother of her children; but it is only quite lately that she has become known as an ardent archæologist, having preferred to keep her investigations secret. Recently, however, it has become known that at the royal villa

and hunting-grounds of Castel Porziano excavations have been going on since 1903, of which she has been the head and inspiration, as well as an active co-worker.

The King, whose private hobby is numismatics, and who has a rare collection of ancient coins, has also shown much interest in, and given much attention to, the work which has been so long in progress. He is said to have a surprising intuition about such things, and seizes the meaning of his archæological professor before he has half

finished his explanation. Even the royal children enter into the spirit of the work, and take their little picks to see what discoveries they can make. Princess Mafalda, the eldest, is especially bright and intelligent, besides being full of energy. She resents being a girl; and her brother, the little heir-apparent, delights in asserting his masculine rights. Nothing upsets her more than to hear him say, in accents of boyish arrogance, referring to himself and his sisters, 'Io sono il maschio; loro sono femmine' ('I am a boy; they are girls'). Yet, for all that, or perhaps on account of it, he never fails in courtesy toward his sisters, always, for instance, rising to open the door for them.

It may be remarked that all applications for permission to visit the royal grounds, formerly so easy to obtain, have during these later years to be submitted to the King, and have been very rarely granted. Thus the secret of the excavations has been well kept, only Professors Lanciani, Pigorini, and Vaglieri being allowed to see the result of the researches, and this solely for the advantage of their wide knowledge and the help of their advice. The Queen has wonderful aptitude for archæology, and her patience is unlimited. She studies the subject thoroughly, catalogues even the smallest discovery, photographs the most important finds, copies in water-colours the mosaic pavements, statues, and frescoes, and keeps a conscientious journal of the progress of the work. All this has a most desirable effect; for, unlike what unfortunately happens on too many other occasions, out of loyalty to their Majesties a strict guard is kept on the treasures found.

Castel Porziano is situated near to Ostia, in the maritime district of Latium, which extends down to Anzio, and was called Laurens or Laurentum by the ancient Latins and Greeks. From this the very ancient city of Laurentum took its name, derived from the abundance of laurels adorning its shores until as late as the second century of the Christian era, as we are told by Herodian, a Greek who resided in Italy, and wrote a history of Rome during the period between 180-238 A.D. He relates that after a great plague which devastated Rome, the Emperor Commodus was advised by his physicians—amongst whom was the celebrated Galen, then flourishing in Rome—to betake himself to Laurentum on account of the pure air of the sea and the grateful shade of the laurel-trees. This tract of coast between Ostia and Anzio has already given up the remains of thirty-five Roman villas, and innumerable others await their turn of resurrection under the picks of the excavators. This is not surprising when we consider that this area formerly contained fourteen cities and villages, the population of which amounted to about one hundred and fifty thousand, and ports capable of containing all the warships and merchant-vessels of Rome.

From as far back as the Stone Age there was

communication between the Ægean and the East on the one hand and Italy on the other, and this has led to the supposition that this spot was that immortalised by Virgil as the place where the old king Latinus started in his sleep at the voice of the oracle announcing to him the coming of his future son-in-law. Here, it is said, were the royal domains where came Æneas, borne by the fiery horses of the old king; here the Fury, the sæva Jovi conjux, spread confusion, causing fierce enmity against the fugitives, and resulting in Such is the opinion of many the Latin war. historians; but Professor Pigorini is dubious on the point, as the only known immigration into these parts at this period was that of the Arians, and no other irruption of outsiders is certain. There is no doubt, however, that one interesting memorial of the Æneid is to be seen on these shores, and that is at Decimo, where Lanciani has discovered an enormous tomb, as yet only partially excavated, measuring thirty-four mètres in diameter, which has been proved to be the tomb described by Virgil, the last resting-place of King Bercennius.

The remains of ancient Laurentum extend along the shore for nearly a mile, beginning at a place called I Muriccioli, and ending at Tor Paterna, where commences the road of Castel Porziano on one side, and on the other that of Via Laurentina, which goes to Rome, marching with the aqueduct on one side, and passing Trigonia, where columns, marbles, a wall of opus reticulatum, &c. have been found. After Trigonia it entered the picturesque inequalities of the shady valley of the Fontanelle, where the road dropped from sixty-one mètres to thirty-one, whence it continued on its course to Rome, entering it by the Porta Nevia, after having passed over the river Almone by a bridge no longer existing. Laurentum was the cradle of the Roman people, the capital of the ancient kingdom of Latium. When Lavinia was founded by Æneas and Lavinia, daughter of King Latinus, as legend tells us, its happier position caused loss of importance to Laurentum, which became part of a new republic. As time went on it became transformed into an imperial villa, of which the extensive and enormous ruins still exist. The district around suffered the same fate; and here ruins of a hitherto unknown suburb have recently been unearthed, rich in public baths and public and private edifices.

The excavations for a new road, one of many with which the King has enriched his domain, have brought to light in the locality called Capocetta some ancient monuments, inscribed and sculptured, as well as the notable remains of a village similar to the Vicus Augustinus. The importance of this discovery is due to the fact that there had been no suspicion that the spot had ever been inhabited, as has now been proved, by a considerable population. The tombs discovered along the road are numerous,

and bear interesting inscriptions, now being studied by Professor Lanciani. The number of the inhabitants is the more surprising as the site has hitherto been considered unfitted for human habitation, the seventy-two miles between Civita Vecchia and Anzio having at the present day but four little villages: Fiumicino, Ostia, Pratica, and Ardea; but in those far-off days the aqueducts rendered all this territory healthy and fruitful, so that Pliny affirmed his villa at Castel Fusano to be pleasant in winter, and still more so in the summer; and Marcus Aurelius delighted in his house at Bottacia, at the present day a most pestilential place on account of the malaria. Numberless remains of villas have been found on the shore in this part in the direction of Rome, where lofty pines lifted their heads and gave grateful shade. woods have now for the most part covered up the ruins, and the roots of the trees have entwined themselves amongst the mighty ruins of fallen cities; whilst around them, on the ground, are to be seen broken columns and capitals, fractured pieces of ornamentation, marbles, and other precious remains. In the villa of Mucius, fatherin-law of Marius, near Trefusina, there are still to be seen the remains of a pavement of white mosaic, as also in other places. Where Castel Porziano now stands was the villa, the Solonium, of Caius Marius, giving proofs of its most ancient origin in Laurentum times; it is situated in one of the four districts described by Macrobius as having been cultivated rationally by the inhabitants, they having learned the agricultural methods of the neighbouring Etruscans.

The mass of the material so far discovered is, according to Professor Lanciani, of the Iron Age, a little more recent than the most ancient tombs of the Latin Hills. A sword found is of the original Ægean type, a type which penetrated into Italy through the cities on the coast and

travelled as far north as Norcia; and this fact seems to corroborate the tradition as to the foundation of Lavinio by strangers coming from the Ægean Sea. In this opinion Lanciani seems to be opposed by Professor Pigorini, who is inclined to disbelieve in the coming of Æneas, and he accounts for the Trojan arms by explaining that from the time of the Stone Age the people were navigators, and that the arms were brought in the way of commerce, for it was not the natives of Italy who made voyages by sea, but the inhabitants of Asia.

Lately many Etruscan tombs have been found, about which Professors Lanciani and Pigorini have consulted together; but in deference to the wishes of the Queen they keep their observations private, only admitting that these tombs are a valuable proof that this shore was inhabited down to the very dunes from the most remote times. Professor Pigorini has admitted that these excavations are of the utmost interest, as they go back to prehistoric times, and, although of no special importance so far, give indication of greater things to come. Unfortunately those excavations already made have yielded up few things in perfect condition, but great hopes are entertained of Ardea and Lavinio.

The excavations cease whilst the King and Queen are absent during the summer, but they are resumed whenever they return to Rome. It is hoped that excavations will be made which will enrich the story of the prehistoric aborigines, and which will be of far greater importance than the discovery of the Roman tombs dating from the end of the Republic and the beginning of Imperial times. These proved the relations existing between the East and the Latin shore, whilst those now expected will be the proof that the country was populated from the earliest ages, and may give us some hint of their customs.

A KNIGHT ON WHEELS.

By IAN HAY, Author of The Right Stuff, A Man's Man, Happy-go-Lucky, &c.

CHAPTER XIV.—continued.

H

PHILIP'S orthodox education was not neglected.
After a year's attendance as a day-boy at
the establishment near St Albans he was sent to
Studley, a great public school in the south of
England. Here many things surprised him.

Having spent most of his life in the company of grown men, he anticipated some difficulty in rubbing along with boys of his own age. Master Philip at this period of his career was surprisingly grown up; in fact, he was within a dangerously short distance of becoming a prig. But he went to school in time. In three weeks the latent instincts of boyhood had fully developed, and Philip played Rugby football, indulged in un-

wholesome and clandestine cookery, rioted noisily when he should have been quiescent, and generally tumbled in and out of scrapes as happily and fortuitously as if he had been born into a vigorous family of ten.

He achieved a respectable position for himself among his fellows, but upon a qualification which would have surprised an older generation. The modern schoolboy is essentially a product of the age he lives in, and the gods he worships are constantly adding to their number. Of what does his Pantheon consist? Foremost, of course, comes the athlete. He is a genuine and permanent deity. His worshippers behold him every

day excelling at football and cricket, lifting incredible weights in the dormitory before retiring to bed, or running a mile in under five minutes. His qualifications are written on his brow, and up he goes to the pinnacle of Olympus, where he endures from age to age. Second comes the boy whose qualifications are equally good, but have to be accepted to a certain extent upon hearsaythe sportsman. A reputed good shot or straight rider to hounds is admitted to Olympus ex officio, and is greatly in request, in the rôle of Sir Oracle, during those interminable discussionscorresponding to the symposia in which those of riper years indulge in clubs and mess-roomswhich invariably arise when the rank and file of the House are assembled round a commonroom fire, in the interval, say, between tea and preparation.

There are other and lesser lights—the wag, for instance. The scholar, as such, has no seat in the sun. His turn comes later in life, when the athletes are licking stamps and running errands.

But the Iron Age in which we live has been responsible for a further addition to the scholastic aristocracy—the motor expert. A boy who can claim to have driven a Rolls-Royce at fifty miles an hour is accorded a place above the salt by popular acclamation. No one with any claim to social distinction can afford to admit ignorance upon such matters as high-tension magnetos and rotary valves. The humblest fag can tell at a glance whether a passing vehicle is a Wolseley or a Delaunay-Belleville. Science masters, for years a despised—or at the best a tolerated race, now achieve a degree of popularity and respect hitherto only attainable by Old Blues, because they understand induced currents and the mysteries of internal combustion. Most curious portent of all, a boy in the Lower School, who cannot be trusted to work out a sum in simple arithmetic without perpetrating several gross errors, and to whom physics and chemistry, as such, are a sealed book entitled Stinks, will solve in his head, readily and correctly, such problems as relate to petrol-mileage or the ratio of gearwheels, and remedy quite readily and skilfully the ticklish troubles that arise from faulty carburettors and short circuits.

It was upon these qualifications that Philip originally obtained admission to the parliament which perennially fugged and argued round the fire on winter evenings. It was true that he had never been fined for exceeding the speed limit in Hyde Park, like Ashley major, or been run into in the Ripley Road, like Master Crump, but his technical knowledge was very complete for a boy of his age; and, being an admirable draughtsman, he could elucidate with paper and pencil mysteries which both he and his audience realised could not be explained by the English language.

In time, too, he became a fair athlete. Cricket he hated, but he developed into a sturdy, though clumsy, forward at football; and his boxing showed promise. His speciality was the strength of his wrist and forearm. On gala nights, when the prefects had been entertaining a guest at tea—an old boy or a junior master—Philip, then a lusty fag rising sixteen, was frequently summoned before the quality to give his celebrated exhibi-

tion of poker-bending.

Having discovered that the boys at Studley were much more grown up than he had expected, Philip was not altogether surprised to find that some of the masters were incredibly young-not to say childish. There was Mr Brett, his Housemaster. Mr Brett was a typical product of a great system—run to seed. Our public schools are very rightly the glory of those who understand them, but they are the despair of those who do not. Generally speaking, they produce a type of man with no special propensities, and consequently no special fads. He has been educated on stereotyped and uncommercial lines. He is not a specialist in any branch of knowledge. His critics say that he is unfitted for any profession, that he cannot write a business letter, that he is frequently incapable of expressing himself in decent English. But—public school tradition has taught him to run straight and speak the truth. The fagging system has taught him to obey an order promptly. The prefectorial system has taught him to frame an order, and see that it is carried out. Games have taught him to play for his side and not for himself. The management of games has instilled into him the first principles of organisation and responsibility. Taking him all round, he is the very man we want to run a half-educated Empire.

Possibly these truths had been known to Mr Brett in his early days. But, as already stated, his principles had run to seed. In the vegetable world-of which schoolmasters are dangerously prone to become distinguished members—whenever judicious watering and pruning are lacking, time operates in one of two ways. A plant either withers and wilts, or it shoots up into a monstrous and unsightly growth. In Mr Brett's intellectual arboretum every shrub had wilted save two-Classics and cricket. These twain, admirable in moderation, had grown up like mustard-trees, and now overshadowed the whole of Mr Brett's mental outlook. In his House he devoted his ripe scholarship and untiring care exclusively to boys who were likely to do well in the Sixth; his mathematicians and scientists were left to look after themselves. French and German he openly described as a sop to the parental Cerberus.' His modern-side boys forgave the slight freely-in fact, they preferred it; and their heavily supervised classical brethren envied them their freedom. But cricket was a different matter. Mr Brett had probably begun by regarding Classics as the greatest intellectual, and cricket as the greatest moral, stimulus in the schoolboy world—a common and, on the whole, perfectly tenable attitude of mind. But by the time that Philip came under his charge it is greatly to be feared that he regarded both as nothing more than a means to an end—Classics as an avenue to scholarships and House-advertisement, cricket as an admirable instrument wherewith to lacerate the feelings of other House-masters.

Cricket was rather overdone at Studley in those days. There were cricket leagues and cricket cups innumerable. Play was organised exactly like work; the control of their pastimes was taken from the hands of the boys themselves and put into the hands of blindly enthusiastic masters. Masters flocked on to the field every afternoon, and bowled remorselessly at every net. Healthy young barbarians who did not happen to possess any aptitude for cricket, and whose only enjoyment of the game lay in the long handle and blind swiping, were compelled to spend their allotted ten minutes standing in an attitude which made it impossible for them to slog the ball, listening giddily the while to impassioned harangues upon the subject of playing forward and keeping a straight bat. Cricket, thus highly officialised, soon began to be accepted by the boys as a mere extension of school routine, and, being turned from play to work, was treated by them as they treated Casar and Euclid—that is to say, they did just as much as they were compelled to do and no more. But their enthusiastic preceptors took no account of this. They glowed internally to think how unselfishly they were devoting their spare time to improving the standard of school cricket (as indeed they were), and cementing the entente cordiale between master and boy (as most assuredly they were not). It did not occur to them that it is possible to have too much of a good thing. Nine boys out of ten would have been grateful enough for half-anhour's coaching a week; but to be compelled to spend every afternoon repressing one's natural instincts, debarred—by that unwritten law which decrees that no boy may address his fellows with any degree of familiarity in the presence of a master—from exchanging the joyous but primitive repartees and impromptus of the young, struck the most docile Studleian as 'a bit too thick.

Worse still, these excellent men quarrelled among themselves as to the respective merits of their pupils. Many a humble fag, contentedly supping off sweet biscuits and contraband sardines in the privacy of his study, would have been amazed (and greatly embarrassed) if he had known that his merits as a leg-break bowler were being maintained or denied with the utmost vehemence over Common-Room port by two overheated graduates of Oxford University. Housemasters plotted and schemed to have the dates of matches put forward or set back in order that some star-performer of their own, at present in the sick-house or away at a funeral, might be enabled to return in time to take part in the fray. Elderly gentlemen, who ought to have known better, rose straight from their knees after evening prayers and besought their pupils to make runs for the honour of the House.

Into this strange vortex the unsuspecting Philip found himself whirled. His first term was comparatively normal. He went to Studley in January, and being, as already recorded, a healthy young animal, soon found his place among his fellows. Of Mr Brett he could make little or nothing. He was by reason of his training in many ways a grown-up boy. There were times when the cackle of the House Common-Room bored him, at which he would have enjoyed a few minutes' conversation with an older man, say upon the morning's news, or some book recently disinterred from the top shelf of the House library. But intercourse with his Housemaster was not for him. Mr Brett, finding that Philip knew little Latin and no Greek, had dismissed him abruptly to the Modern Side, as one of that noxious but necessary band of pariahs whose tainted but necessary contributions make it possible for the elect to continue the pursuit of Classics. As for Philip's football promise, it was nothing to Mr Brett. This most consistent of men considered the worship of football 'a fetish.'

All hope of further intimacy between this antagonistic pair ended during the following summer term, when, to Philip's unutterable amazement, Mr Brett declined to speak to him for the space of three days, because Philip, by inadvertently running out the most promising batsman on his side in the course of a Junior House League match, had deprived Mr Brett of a possible two points out of the total necessary to secure the Junior House Cricket Cup. The incident did not disturb Philip's peace of mind to any extent. It merely crystallised his opinion of his Housemaster. He possessed a large measure of his uncle's gift of terse summarisation of character.

'This chap,' he observed to himself, 'is the most almighty and unutterable sweep in the scholastic profession, besides being a silly baby. I must turn him down, that's all.'

Henceforward Philip went his own way. He met his Housemaster but seldom, for he was naturally excluded from such unofficial hospitalities as Sunday breakfasts and half-holiday teas. Neither did the two come into official collision, for Philip was a glutton for work, and reached the top of the Modern Side by giant strides. The only direct result of their strained relations was that Philip was not made a prefect when the time came. Mr Brett could not reconcile his conscience to placing in a position of authority a boy who was neither a Classic nor a cricketer, who was lacking in esprit de corps, and made a fetish of football and science.

But Philip was contented enough. True, he could not take his meals at the high table, neither could he set fags running errands for

him, but he possessed resources denied to most boys. He became the devoted disciple of one of the junior Science masters, Mr Eden, who, almost delirious with joy at having discovered a boy who loved Science for its own sake, and not merely because the pursuit thereof excused him from Latin verse, took Philip to his bosom. Under his direction Philip read widely and judiciously, and was permitted in fullness of time to embark upon 'research work'—that is, to potter about the laboratory during his spare hours and make himself familiar with the use and manipulation of every piece of apparatus that he encountered.

He had his friends in the House too. was Desborough, a big, lazy member of the Fifth, the son of an Irish baronet, much more interested in sport than games, though he was a passable enough athlete. Desborough disliked the rigidity of Mr Brett's régime, and pined occasionally for the spacious freedom of his country home, with its dogs and guns by day and bridge and billiards in the evening. there was Laird, a Scot of Scots, much too deeply interested in the question of his future career as a Cabinet Minister to suffer compulsory games and unprofitable conversation with any degree of gladness. And there was Lemaire, the intellectual giant of the House, who, though high up in the Sixth, was considered by Mr Brett to have forfeited all right to a position of authority among his fellows by having been born into the

world with a club foot. But though he could play no games, Lemaire exacted more respect and consideration from the House than Mr Brett dreamed of, for he possessed a quick wit and a

blistering tongue.

It was with these three that Philip forgathered during his later years at school. The Quartette, as they were called, resembled secondyear undergraduates rather than third year schoolboys in their attitude to life and their methods of recreation. Being endowed with no authority, they escaped the obsession of responsibility which lies so heavily upon the shoulders of youthful officialdom, and they conformed to the rules of the House and school with indulgent tolerance, observing the spirit rather than the letter of the law. Which was just as well, for boys in their position could have done incalculable harm had they felt so disposed. The prefects were secretly afraid of them, and left them to themselves. The House as a whole venerated them, especially Philip and Desborough, and would gladly have been admitted to greater intimacy. But the Quartette would have none of them. They preferred to hold aloof from the turbulent camaraderie of the Common-Room, and congregate in one or other of their studies, where it was rumoured that they talked politics.

But rumour was wrong, or at any rate only partially in possession of the facts, as you shall hear.

(Continued on page 226.)

THOUGHTS OF A TRAVELLER.

By F. G. AFLALO.

I .- TROUBLES BY LAND AND SEA.

TIME, the healer, robs retrospect of bitterness. When from the regained security of the domestic hearth we look back to the wanderings of years in other continents, it is easier to recall the sunshine than the rain. Next to our inability to see what the future has in store for us, this optimism of reminiscence is our most blessed gift. Were it otherwise, were we not only to remember the unhappy hours of yesterday, but also to foresee those of to-morrow, this our life would be unbearable.

Yet there are thorns and stones which even the most enthusiastic globe-trotter cannot wholly obliterate from memory; and, since it is better to profit by the mistakes of others, his friends may even turn such memories to account when their turn comes to face the long trail. A few of these trials, recalled from years of wandering up and down the earth, may possibly be of use to those happy ones with the road all before them. They are trials encountered only on the beaten track of tourist travel. The dangers and difficulties which beset those more hardy adventurers who brave the polar ice or breast the tropic jungle are sufficiently familiar in current books of travel. Yet the railroad and mail-boat also have their traps for the unwary.

What, for instance, could be more disconcerting to inexperienced travellers, particularly of the gentler sex, than the publicity of the sleeping and dressing accommodation on American and Canadian railroads? What more chaotic than the feelings of a nervous woman able to secure only an upper berth in a crowded Pullman? She has to climb the steps, held perhaps by a grinning negro, in full view of a score of men and women; and then, behind drawn curtains, she has to divest herself as best she may of her clothes and dispose of these on and round In the morning she must attire her bunk. herself scantily but decently, and then make her way between the other beds, stumbling in the half-light over boots and 'grips' to a tiny cupboard of a dressing-room, already occupied, it may be, by two or three others of her sex. If so fortunate as to secure a 'lower,' she is somewhat better off, for her boots and bag can at any rate go underneath, and there is no painful performance with the ladder. At best, however, the sleeping quarters on even the most luxurious of the 'limited' trains, short of the expense of a 'drawing-room,' are wretched, and offer much less comfort at twelve shillings a night than our own north-country trains do for a smaller sum.

The price charged for meals on these trains is often extortionate. It is true that on a few lines, notably the Intercolonial of Canada. a fair meal is supplied at the inclusive price of a dollar; and no one can object that four shillings and twopence is too much to ask for half-a-dozen courses cooked and served in transit. On other lines, however, the meals are served à la carte, and at such charges that it is not unusual to spend seven or eight shillings on a dinner of no immoderate length. The catering is careless, with no provision for emergency crowds, with the result that during a fair at Toronto or a Congress at Montreal there may be three times as many people in the cars as were allowed for, and those who come last, while paying the same as the others, have to do without sufficient milk, butter, and other articles.

Then, again, who has not suffered east and west, north and south, from the selfishness of those who dislike fresh air worse than sin? Why, with the repeated altercations and complaints brought to the notice of the guards and conductors, will the companies do nothing to alleviate the misery of those who dislike the underground atmosphere affected by badgers? A simple solution of the difficulty would offer itself in the supply of one or two carriages of each class in which the windows should be closed on the requisition of a single inmate. It would then be perfectly simple for the guard to stow the whole of the anti-fresh-air brigade into this special accommodation, and the rest could breathe. As it is, with neither written nor unwritten law, beyond the very vague custom which gives the choice to the passenger next the window and facing the engine, guards and passengers alike have nothing to go upon.

Why should there be no rule touching the disposal of hand-baggage inside the carriage? The Americans dispose of the matter effectually by forbidding any but the smallest 'grips' or parcels inside the cars. The French and some other Continental nations have a more intelligent practice of assigning to each occupant the space on the rack immediately over his head, thus precluding the selfish habit, too common on our own trains, of a single passenger taking possession of an empty carriage and promptly seizing the whole of the rack for the rest of a long journey with several stoppages, leaving no room for the small luggage of those who join the train later. First come, first served, is often an admirable rule, but it can be carried too far.

Porters, or the lack of them, may constitute

a serious drawback to the pleasure of railway travel. On the American continent, indeed, porters are rare and independent, for the simple reason that the majority of Americans would rather carry their own bags to a cab than pay a porter to do so. In Canada the traveller is rather better off, as there is generally a contingent of 'redcaps' awaiting the arrival of each train. Yet these also, weary perhaps of the indifference of the considerable American contingent of tourists to their offers of assistance, sometimes fail to be on the spot when required. Latterly, indeed, some of this unreadiness of porters has been noticeable even at our own London termini. The 'tip' is probably at the root of the evil, and until railway companies are compelled to pay these humble servants a wage which, while not putting them above such gratuities, should at any rate enable tips to be dispensed with, porters will continue to look askance until they are wooed with a humility which forecasts extra largesse.

Ocean travel has, it must be confessed, fewer trials for the inexperienced, simply because the officers and stewards of all well-appointed liners, mail-boats or otherwise, make it their business to see that the passengers are properly looked after—a duty which devolves on no one connected with a train, and which is at best indifferently fulfilled by an unusually obliging or conscientious guard

Sea-sickness is the ever-present drawback of board-ship life—not always your own, but sometimes that of others. Nothing can well be more horrible than to share a cabin with a sufferer from this distressing malady; while it is only a little less upsetting to see your neighbour at table suddenly make a wild bolt for the door of the saloon, or the occupant of the next deck-chair rushing with great determination to the railing. There is hardly a remedy for these contretemps; though it may be possible for a friendly purser to change your cabin, and it should not be difficult to have your deck-chair put next to that of some one immune from such sudden calls on his time.

One-half of the little social troubles on board ship arise from scandal-mongering, and the rest from want of tact. The golden principle of give and take can be ignored only with disastrous results to all concerned. While, on the one hand, those who indulge in boisterous deck-games should exercise tolerance of invalids and others with no inclination for such recreation, something is also due from the last-mentioned, who should not intentionally have their deck-chairs planted in the way of the players. Gossip, save of the most harmless sort, should be sternly discouraged. There is nowhere else where it so easily becomes a habit, mainly from lack of more wholesome occupation. Practical jokes are quite out of place, particularly with comparative strangers; yet there are people gifted with a hilarious

temperament who unhesitatingly try them on all and sundry, feeling aggrieved if they are resented.

In every voyage in the tropics there is certain to be more or less vermin in the ship. Rats may be out of place in cabins, but fleas are most certainly not, and it behoves the philosophic passenger to provide himself with insecticide powders, and to drive the enemy from his berth without endless complaint to the authorities.

Pet animals are sometimes a nuisance on board, and at others a pleasure. They resemble children. They are a pleasure when they are your own, and a nuisance when they belong to some one else. There is no need, however, to make a fuss just because some small marmoset or chipmunk or squirrel is brought on deck for an airing. Dogs, parrots, and monkeys should be sternly suppressed, because they are noisy; but voiceless creatures like lizards or tortoises do no harm to any one. The intrusion of passengers from the second-class into first-class precincts is a minor annoyance which may usually be dealt with by quiet reference to the deck steward or quartermaster. It is certainly not worth troubling the captain about. Few of these little grievances are. He has enough to do in looking after the safety of the ship, and is neither a policeman nor an encyclopædia, though many passengers insist on regarding him as a combination of both.

H .-- OUT AND HOME.

What a gap there is between the first day of a journey and the last! The willing exile, who loves travel for its own sake, steps lightly up the gangway, with an anxious eye on the porter with his lighter luggage, and a curious glance for the new home and for those who are to be his comrades for a week or a month of sea and sky. Then he leans on the rail and looks down at the busy quay as the mailbags and the last of the passengers come aboard. How he has planned and worked for this trip! How much it has meant for him: the change of scene, of food, perhaps of language; new illnesses, it may be new sensations; but, agreeable or otherwise, all new! He is obeying the unconquerable instinct to 'go and look behind the ranges; and the comfort of his club and the peace of his hearth seem already far away, for it is too soon to feel regrets that may come later. As the gangways are hauled ashore, the great ropes cast off, and the little tugs help the great liner out into midstream, he looks his last on Liverpool or Southampton, then goes below to settle in his new quarters.

Three months later, camping under the clear Canadian sky, or watching the wanton fireflies from a Jamaica veranda, or elbowing his way through the dusky press of some Eastern market or bazaar, he suddenly thinks that it would be good to be home again. This nostalgia is a strange mood, coming without warning, not even

brought on by a letter or other reminder; though more often resulting, it may be unconsciously, from some annoyance or disillusion of the new The sport is a failure; the guides are insubordinate; the heat, the cold, the mosquitoes, the dust, the extortion of hotels, the monotony of human ebony, a recurrence of malaria—in short, some drawback of his travels, rather than the sweetness of home, is the surest magnet to draw him the way he came. Without such excuse, indeed, this Heimweh is a morbid mood, since the tourist voluntarily turned his back on home, to discover its virtues only when it was lost to view. This hankering after what we have not got is the commonest of human foibles; but the home-sickness which obsesses men in the jungle or on the veldt is a deeper-rooted emotion proper only in those whose exile is compulsory, the pioneers of empire, soldiers, administrators, and humbler workers of our outposts. In those who seek other scenes for change, home-sickness is a confession of weakness and discontent.

And so, either prematurely or at the appointed time, the exile comes home again. He may land at Liverpool or at Southampton in April sunshine or November fog. He may be met on the quay by those impatient for his return, or he may slink away to the waiting train unnoticed and unwelcomed. He may come back to the embrace of his family or to the bailiffs. Yet, whatever the circumstances of his return, he has come home, and there is no getting away from it. The landmarks of the journey to town fly by. Crewe is passed, or Winchester; Euston, or Waterloo, lies ahead. His trip might all have been a dream. He can hardly realise that since he last flew by these trim hedges and village churches he has smelt the East, or looked upon the awful majesty of the Rockies, or luxuriated in the hospitable sloth of West Indian burgalows. Yet, in case he should entertain any doubts as to the reality of his odyssey, there, on the seat beside him, is the faithful old suit-case, its frayed leather a crazywork of hotel labels of every size, shape, and colour, pasted on this moving hoarding by officious hall-porters East and West. The Grunwald of New Orleans overlaps the Pera Palace of Constantinople; the Myrtle Bank, recalling the phœnix renascence of Kingston, is cheek by jowl with the Place Viger of northern Montreal; the Portland brings back the scent of roses, the Tahoe Tavern the flash of trout; here is a label that recalls sunshine in the Puerta. del Sol, there a fragment reminiscent of robed paynim entering or leaving the Mosque of the Ommayedes in Damascus. And over all, newer than the rest, affixed but the evening before by the cabin steward, is the legend 'London.' London indeed, at once the beginning and the end of his travels, must be looming near. It is time to pull himself together, and to realise that one more trip has joined the memories that

WHEN THE CATTLE PANIC.

By G. TREVOR ROLLER.

LITTLE PANCHO blew a smoke-wreath into the air, sat back in his saddle, and surveyed the restless herd. His ear was well used to the noises that filled that cold hour before the dawn. The restless tramping, the occasional clashing of horns; then almost a silence, only to be broken by the quick, rushing pad of hoofs over the baked ground, a thud, and a coughing (almost human) grunt from some steer that had taken it broadside; then the trampling and horn-clashing would start again. Little Pancho knew it all so

Twelve years of the cattle-roads had taught Pancho that these restless sounds might mean nothing, and yet, again, might mean everything; so he pulled his serape tighter round him, looked up at the strip of sky that showed cold and gray between the high barranca walls, and philosophically prayed for the dawn. Before him, halfasleep in his saddle, sat his master, the man whose word meant law to him; and yet that man's experience of cattle-driving in Mexico was as nothing compared with his. The man before him was boss because of superior brains, because of superior knowledge of the commercial value of cattle. He was the man who figured, and bought, and saw the cattle safely to the railroad. Pancho was only the foreman vaquero, a cattledriver, and as such must take his orders from the tall, sleepy Englishman before him.

Pancho wondered rather why that loose-limbed son of the North could sit so peacefully, his unlit pipe clenched in his teeth, while the cattle whirled and stamped. Ah, he forgot; this señor was English, a cattle-buyer only, who knew nothing of the nature of the beasts-their weight perhaps at a glance, their value, even their shrinking capacity, but not their nature. No, he could not know that! He came from wellregulated stockyards. What could he know of the cattle-roads, the rest-places, the storm herd-And yet that Englishman had always taken advice from him on this trip; yes, and on the last, when they had first met. until to-night. To-night nothing would please him but the barranca. He would not stop in the open country to the west; he would not press on through the barranca to the rest-house and tienda to the east. 'No,' he told Pancho; 'when we camp near a tienda the men sneak off and guzzle tecela; they get very drunk; they are hard to rouse in the morning. No; we will camp in the barranca. The cattle will take little herding there—two men to the east end, two men to the west. That's how we shall do it, eh, Pancho?' est. That's how we shall do it, eh, Pancho?'
Pancho had taken that as final. He was sorry

now he had not protested. A barranca is a bad place to camp in—a very bad place! The cattle have no room; panic comes quickly in a crowd, a crush. Boulders have a way of loosening in barranca walls and roaring down upon sleeping cattle, that wake half-dazed, with one thought only-to gallop, gallop madly, from the noise that came on them in the dark in their sleep. And then, again, the rains were at hand; there was a feel as of thunder. Upon the plains all would be still; but down here, in this narrow walled lane, mysterious warm draughts seemed to be moving, stirring the few dried leaves on the scrub oaks, making spiral eddies of the dust. The cattle felt the eerie strangeness. Pancho felt it, and Pancho's half-broken pony felt it more than all. Pancho was a cow-puncher to his backbone, and he knew the signs. When the pony between your knees behaves like an overstrung woman, it is time to look out for trouble. First he would see what singing would do, for cattle like to be sung to; so he turned and rode to the north. Then, swinging in his saddle to the time, he sang, in that weird yet soothing tone of the mule-drivers and cowboys of Mexico, a song as old as himself—ay, older. Verse after verse he crooned to the cattle. For these songs have many verses full of sadness, full of love; they tell of the passions of the South, the soft arms of women, the hot, unchecked quarrels of rivals, the peace of lonely lovers clothed in a velvet night. They told of life as he knew it, unfettered, free to live.

At the barranca wall Pancho turned back to the other side, passing his master, but still singing. Back and forth he rode. Across the herd, to the west, the other cowboys had taken up his song. At first the cattle seemed to become quieter, but not for long. Again they started their aimless moving. Pancho pressed his pony alongside the Englishman.

'They are restless to-night, Pancho,' his master said in Spanish. 'I've never seen them like

What frightens them?'

'They expect a storm, señor; they are like this when they expect a thing, and when it comes they are quiet. But while they are waiting is the time to fear. A sudden surprise now, and that would start them stampeding. And yet, again, it might not; one never knows with cattle. I have seen a herd started by the clapping of a child's small hands; and I've seen a drunken vaquero fire his revolver over a restless bunch, and they stood like old work-oxen. Ah señor, they are like women; one never knows!' Pancho necked his pony to the east. 'More room, señor,' he said; 'let us give them room.'

The Englishman followed. He dropped his reins on his pony's neck and started filling his pipe. A stampede, he thought, would be a

novel thing for him; and he was out here with his eyes open for new things. Then, as he looked at the pitchy-black road before him, and remembered the half-dry watercourse and nasty holes he had seen the evening before, he thought that a ride in front of a half-mad bunch of cattle down that barranca would very well surpass any hunting run he had ever known for excitement; and he shuddered. Then to think how the cattle would waste-his beloved cattle, that he had bargained for and bought, staking his reputation on his judgment! They would lose pounds and pounds in weight. Why, a restless night like this was bad enough; but—— He kicked his pony up to the Mexican. 'We mustn't let them stampede, Pancho. Can't we ride into them and cut them out, and make them spread a bit?' he asked.

'No, no, señor / If we ride near them, too near, they will start milling; they will move on to the other side, perhaps. The cowboys might not be able to hold them, who knows? Ah, look, señor / they are loosening; some have spread out. That is better.'

A few shadowy forms loomed up and took shape; they came toward the horses, stopped, and turned aside. Pancho dismounted and led his little nondescript-coloured pony away. Presently the Englishman heard splashing. He too dismounted and walked to the water.

'Don't let your pony drink, señor. I do not let mine. I only came to find out where the watercourse ran.'

'But why not water them now, Pancho?' asked the Englishman.

'A mouthful only, then, señor,' answered Pancho. 'Later let them drink their fill, for here is the dawn.' He pointed to a band of gray in the east. 'We may have to gallop, señor, and ponies gallop badly when they are full of water.'

'But I thought you said it was all right?' said the Englishman, gazing at the herd through the growing light.

'I said things were better, señor; one is never all right with cattle at times like this.—Ah, you ill-bred cayote! would you put your unworthy feet on the señor's toes, you he-goat!' This to his pony, that had started back and crowded the Englishman.

The little Mexican's vehemence amused his master, and, with a low laugh, he leant forward to push the pony in the flank and make it stand over, as he would have done to an English hunter. No sooner had he touched the pony than it was away from him. One single jump, and it landed some yards off, all four feet in a bunch, emitting a snort, not of fear, but of defiance.

'Nice sort of pony!' said the Englishman; 'he's more like a jack-rabbit.'

Pancho hauled in the pony by the head-rope and gently rubbed him behind the ears till he pricked them again.

'Oh, he is gentle, señor /' he said. The Englishman laughed.

So, in defence of his cow-hocked little terror, Pancho continued: 'Now, yesterday, in the morning, he was bad. You think of that, señor. But it was my fault. The cinch slipped back under his belly; then of course he bucked till he bucked himself out of the saddle. Ah, my little Juarez would do that; he would stop to do it if a stampeding bunch of cattle were after him.-No, you do not like the girth too far back; you do not like to be hurt. Otherwise you are very gentle, are you not Chicito? Yes, truly!' Then, as if to give the lie to his words, he carefully took the bridle just above the bit in his left hand, pulled the pony's head round to his shoulder, put his right hand on the saddle-horn, and mounted. When he was quite settled he let the pony's head go. A wise precaution, if one were to judge by the laid-back ears and tucked-in tail of the 'gentle one.'

The light had grown apace, and the herd could be seen like gray ghosts in the dawn. They were still rather packed and rather restless. The air was very still all round them; dark clouds

were banking up in the west.

'I think, señor,' said Pancho, 'we should move little by little down the barranca. I will shout to the others to drive little by little very gently; then the cattle will spread out for a mile or more. That will give them room. Then the storm will come, and they will turn their tails to it and be quiet, and we can leave a man at the head of the gulch and go back to the camp for some food.' So saying, he shouted and signalled to the other cowboys.

The Englishman looked across the backs of the cattle to the camp that lay on a stretch of higher ground. Already dim figures moved about amongst the equipment. Pancho shouted to them—they were the men who had watched through the earlier part of the night—to saddle up and help to loose the herd. Then he turned the pony and started up the barranca, crying to the cattle. 'Hoo-ar novel-yos, hoo-ar novel-yos /' he sang merrily, as the Englishman rode at his side. But, call as coaxingly as he could, the cattle would not follow. The leaders would advance a step or two, stand with their feet apart for a moment, and move off to the right at a shambling walk; then, throwing up their heads, they would crowd back into the herd. The two mounted men on the other side were using their ropes, swinging them round and bringing them down with a thwack on the backs of the steers. But still the cattle came forward on Pancho's side, turned to the right, and walked back to the herd. It was the beginning of a 'mill.' Soon, if they were not careful. that great bunch of fourteen hundred head of cattle would be turned into a living maelstrom; they would not be merely coming out, turning to the right at a walk; they would be gallopinggalloping their hoofs off in a whirling, maddening 'mill.' Then two or three half-mad steers would break from that sickening dust-cloud at the point of least resistance, followed by others; they would be the edge of the wedge; but the others would follow until the barranca was filled from wall to wall with a wave of tossing horns and crazed, galloping hoofs.

Pancho knew this, and he tried to break the 'mill' before it became chaos. His rope was out now; he wheeled the little pony and galloped back to the cattle, forcing against the stream; but they only crowded from him, pressing on the centre. Worse still, they no longer walked; it was a silly, half-dazed trot, and the dust rose up in dense red clouds. Those in the centre were bellowing, for the pressure was anormous.

Then things began to happen quickly. Pancho was galloping backward and forward, cursing and shouting, and whirling his rope. Two steers tried to break away. The Englishman instinctively rode at them and turned them. Pancho dashed up to him in a cloud of dust to help. Then all at once, behind him, up by the barranca's northern wall, they broke, a stream of them pelting under the wall like an avalanche.

'Keep ahead of them, señor!' yelled Pancho.
'I will try to thin them out.'

The Englishman galloped to the front; then, turning in his saddle, he fired his revolver at the leading steer. Whether he hit it or not he did not know, but he fired again and again. He might have shot at an Atlantic roller for all the difference it made on the maddened Pancho had ridden straight for the stream of cattle, trying to cut it. As he rode a steer's flank pressed against his left leg, and he slashed the animal over the face with his rope, blinding it. Suddenly he glanced over his right shoulder, and that glance told him the game was up. The cattle no longer followed the wedge; they were coming in a mass, coming like hell let loose, fourteen hundred head of cattle-fourteen hundred head of crazed steers that would not stop in that narrow defile for any power on earthnot now. They were fairly alight, and Pancho knew he could not save them. They would go on for two miles till the barranca opened on to the plain, then pour forth like water from a culvert, spread out, and stop. There was no stopping them here; they would cover that two miles if they were their hoofs to the bone. There was no saving them, and many would be killed.

As for Pancho, he had no wish to figure in

As for Pancho, he had no wish to figure in that casualty list, and he had no wish that his master should. The little pony was speedy, and he had no trouble in ranging alongside the Englishman. 'Ride, señor /' he cried. 'We can't save them; we must keep ahead—well ahead. There is no way out of the barranca except at the end. We must get there—first.'

The ponies now fairly stretched to their

work. They were cattle-ponies born and bred, and they went over the rough ground like cats.

For a few moments the Englishman did not grasp the reality of the situation. looked back, and saw only a short way behind a very inferno—the flying dust, the straining cattle; but the noise of that moving hell was more appalling than the sight. He knew now he was riding for his life. A false step meant a fall. Perhaps he would not be knocked out; he would get on to his feet, there would be a short run, a frenzied run, as in a dream, and then—— He glanced at Pancho. The little Mexican was looking behind him now and again, watching the track in front, then jerking a look behind. Suddenly a change came over Pancho's pony, and the Englishman noticed it. The pony's ears went back and his quarters seemed to go under him. 'If the girth got too far back my little Juarez would stop to buck even if a bunch of cattle were after him.' Those words flashed through the Englishman's mind, and he glanced at the girth.

'Good heavens, Pancho, your saddle's slipping!'
Pancho looked down at his pony's withers,
then turned his head. Despair was written on
his face. 'Yes, señor,' he said, 'it is slipping.
You ride on; you can do nothing.'

'Can't you undo the girth, Pancho?'

Pancho's face suddenly brightened, and he grinned. 'Oh, I'm loco' he cried. 'Not undo—cut, yes.' His knife was tucked in the leg of his high boot, and in a moment he had it; but in that moment the pony's stride had shortened. He was going to stop there and buck, with death at his heels, because a girth had slipped back! He made a rocking plunge forward, fighting for his head; but as he did so Pancho slipped the knife under the webbing cinch, gave one tug, and it was flying loose. Throwing the knife from him, he flung himself over the saddle-horn on to the pony's neck, and the saddle fell to the ground. For a second the pony wavered, then stretched to his work again.

'My saddle will be spoilt,' shouted Pancho.

The Englishman said nothing. He had come very near to tragedy; he had very nearly been required to make up his mind whether to wait and try to save this man while his insane pony was endeavouring to buck himself free of his saddle, or whether to ride on. And a three seconds' wait meant death! It was not pleasant. He sat forward in his saddle watching—watching the end of the barranca, which was now in sight. Only a short distance now and he would get away from that ghastly roar behind him.

The little Mexican, sitting the barebacked pony as if it were an arm-chair, shouted to him, 'Turn to the right, señor, when we come out. They will spread and stop. The others will round them up.'

The two reached the open at last, swung to the

right up a sharp incline, reined in their reeking ponies, and looked back on the fourteen hundred head of destruction-dealers that followed. Out they came with a burst. A steer in front fell, two more turned over him, and then the main bunch hid them from sight. On they came. The leaders had expanded. As the animals in the rear emerged the Englishman saw some of the men, the greater part bare-backed. They went to right and left to get round the bunch. One raised his arm and shouted as he caught sight of the two on the hill.

Far out on the plain the cattle were spreading, the boys riding through them to get in front. For the first time the Englishman realised it was raining. He took his poncho from his saddle and threw it over him. The storm had come.

Pancho stood beside his pony, rubbing its ears affectionately, watching the plain. 'They hold them now, señor,' he said. 'Come, let us ride back to the camp. Coffee will be ready for us.'

The Englishman would have liked to stand

there on that rising ground and put in a bit of thinking. He had just finished the most exciting ride of his life. He had been within a few feet of death. And it was so new, terribly new; yet this little brown-eyed Mexican beside him talked of coffee!

'You've been in that sort of thing before,

Pancho?' he said.

'Si, señor,' answered Pancho. 'We have to take these things as we take other things—pleasant things, the rough with the smooth. We pay a price for the air we breathe, the women we love, the free life we lead. That was bad, señor. I have lost a saddle. You have lost some steers. We both nearly lost our lives. But now it is over; it is behind us. Come, señor, the coffee—and perhaps eggs. Quien sabe?'

The Englishman looked at him for a moment. 'Great Scott, the beggar's a fatalist!' he thought. They started riding slowly back to camp. Then he felt suddenly very hungry. 'Coffee,' he said aloud, 'and perhaps eggs. Who knows?'

IN PILGRIM GARB.

THE modern pilgrim has possibly quite material ends in view, and may be little of an idealist, in journeying to the Rhine, the Riviera, or around the world. Matters of business, restless curiosity, love of adventure, or quest of health may each and all mingle in the decision which sends him away from home surroundings. Certain enthusiasms warm the heart of the historical and literary pilgrim who finds shrines for admiration and wonder wherever a great man has lived or died, or a great deed has been done. The magnetism of Westminster Abbey, Stratfordon-Avon, or Abbotsford draws such pilgrims from the ends of the earth. The religious pilgrim may either be very enlightened or very ignorant. He appears to have flourished most in the least enlightened times and countries.

Chaucer has graphically shown us a company of pilgrims-twenty-nine 'sundry folk' whom he met at the Tabard Inn, Southwark, bent on a pilgrimage to the shrine of Thomas à Becket at Canterbury. People suffering from curable or incurable trouble resorted to our Lady of Walsingham; to Glastonbury, with its holy thorn which flowered at Christmas, and its Church of St Joseph of Arimathea; to the tomb of St Cuthbert at Durham; to York, Winchester, or Beverley. Pilgrimages were incessant in the Middle Ages, to fulfil a vow or expiate sin. The pilgrimage has survived to these times. Since a peasant girl, fifty-five years ago, announced that the Virgin Mary had appeared to her at a grotto in the then unknown hamlet of Lourdes, countless pilgrims have gone thither. Thousands of pilgrims go annually to Benares, the most sacred city of the Hindus, as Mecca and Medina

are goals of the devout Mussulman. The pious Russian pilgrim has Jerusalem as his goal, where he visits the holy places, and afterwards bathes in the Jordan in the shroud which will be his winding-sheet.

To visit Mecca and return scathless the Christian pilgrim must adopt a disguise, and otherwise be alert, clever, resourceful, and a good linguist. Among the first Christians to visit Mecca was Domingo Badia-y-Lablich, a native of Barcelona, who crossed to Africa in 1801 disguised as a Mussulman, under the name of Ali Bei. A later visitor was U. J. Seetzen, in 1809. The well-known Eastern traveller John L. Burckhardt (1784-1817), after his wanderings in Abyssinia, visited Mecca, and performed the rites of a pilgrim there, going round the Kaaba and acquitting himself as a Moslem. He mingled with the pilgrims without being suspected, and spent September to November 1814 in Mecca. Later he visited Medina. Sir Richard F. Burton, the famous linguist and traveller, used various disguises on his way to Mecca in 1853. Burton says that, however safe a Christian might be in Mecca, nothing could preserve him from the ready knives of enraged fanatics if he was detected in the holy house. The very idea is pollution to a Moslem. 'Those,' he says, 'who find danger the salt of pleasure may visit Mecca; but if asked whether the results justify the risk, I should reply in the negative.

Arminius Vambery, orientalist and traveller, disguised as a dervish or mendicant friar, performed a remarkable journey through the deserts of the Oxus to Khiva, Bokhara, and Samarcand with a herd of fanatics by whom he would have

been torn in pieces if they had discovered who he was. His experience led him to support the opinion that the rule of Britain in the East was more beneficial than that of Russia. Vambery found that the preservation of his incognito was a tremendous mental and physical exertion. His poverty-stricken and dirty appearance helped the disguise. Sand and dirt gathered in the seams and cracks of his face, and where water was unavailable, the sand of the desert had to do instead. The sufferings he endured from hunger, thirst, and vermin were worse than anything possible in Europe. His headgear was ragged and coarse, his eyes rolled wildly, and he slept squeezed among a row of snoring beggars. What he suffered from lice is beyond description. Catching vermin was a favourite after-dinner occupation of these beggars. The garment might be held over red-hot cinders, and the lice died a fiery death with a crackling noise. Another method was to strew the garment with sand and expose it to the rays of the sun, which caused the vermin to shift their quarters. When neither fire nor sand was available, the garments might be left near an ant-hill. The ants streamed out and captured their lawful prey.

In his book, With Russian Pilgrims (1893), the Rev. A. A. Boddy records a visit he paid to the White Sea Monastery of Solovetsk. A later pilgrim in disguise was Mr Stephen Graham, who has written an admirably descriptive record of his trip With the Russian Pilgrims to Jerusalem (Macmillan & Co.). The excellent photographs further illuminate the text. Such a journey has never been so well described before, and the author of A Tramp's Sketches is just the man to do it justice. It reads like a prose poem, in which due place is given to fact. Mr Graham knows the Russian language and is full of religious sympathy, and has projected himself very cleverly into the Russian mind. By his aid we can mingle in the crowd of Russian pilgrims in sheepskin coats, with their bundles, as they leave in the overcrowded steamer which sails from Constantinople to Jaffa; and can realise the life on board, the unspeakable condition of the hold, where four hundred human beings were crammed, the terrible storm, and the whole fortnight's voyage to Palestine. The writer is a born wanderer, a rebel against modern conditions and commercialism. He tells us he has tramped alone over the battlefields of the Crimea, visited the cemetery where lie so many British dead, wandered a thousand miles along the Black Sea shores to New Athos monastery and Batum; has been with seven thousand peasant pilgrims to Jerusalem, and lived their life in the hospitable Greek monasteries and in the great Russian hostelry at the Holy City; has bathed with them in Jordan, where all were dressed in their deathshrouds; and has slept a whole night with them in the Sepulchre.

There was not a sailor on board the steamer

Lazarus but laughed at the five hundred and sixty pilgrims, and called them fools. Stephen Graham, being intelligently sympathetic with them, gained their confidence, and knew many of them well ere the journey was over. They were all peasants, the upper and middle classes being unrepresented. Some had walked a thousand miles or more through Russia before embarking, perhaps spending the savings of years on the journey. Nearly all the men had wadded overcoats or fur-lined jackets, and long-haired sheepskin caps. The women were arrayed in bundles of petticoats, with layers of homespun linen over their shoulders, and thick gray shawls over their heads. The dark, foul-smelling hold contained a wilderness of linen packs, men and women lying among them. Those who were ill, feeble, or maimed were in the most noisome recesses. Some prayed and sang aloud all night; others sat in groups and read the Bible aloud, or sang songs or hymns. There were some typical Turkish passengers; a Greek Jew showman, with barrelorgan, three apes, and a bull with two mouths; Syrian women with baggy trousers; also saucy unveiled women, without stockings, but with gold rings on their big-toes, heavy silver serpents on their ankles, and bracelets at their

Among this motley crew Graham was disguised in an ancient blue blouse, looking like the discarded wear of an engine-driver, with a burden on his back similar to that of Christian in the *Pilgrim's Progress*. As it was impossible for him to sleep in the hold, he chose as his bed a carpenter's bench on deck. He was taken for granted, and photographed as a pilgrim by a German. An old woman, thinking it unfriendly for a man to read books by himself, took a book out of his hand, saying, 'Don't read so much, or God will make a saint of you and take you from us.' Another dame, finding him scribbling, asked the loan of his pencil, as she also was a poet! As they neared Jaffa one peasant was heard to say, 'God has made the sea calm and the earth beautiful. It is because we are nearing the Holy Land.' The poorer pilgrims brought piles of black bread in waste ends and crusts gone mouldy. These were exposed to sun and air; hot water and salt were added to make a kind of soup; oil and black olives made it a festival diet; or it might be soaked in tea and eaten. Some ate the crusts along with a spring onion. Richer peasants had sacks of beans and potatoes, and made themselves porridge, or bought oranges, locust-beans, nuts, honey, or figs. One of their spiritual guides, Father Yevgeny, advised the pilgrims to read the Gospels, Psalter, and the history of the Church, but to have nothing to do with contemporary writings. 'Never look at anything foreign or modern. Truth has no need to be modern. When people come to you with new ideas, have nothing to do with them. Just answer, "I'm a simple Mouzak. I'm too

stupid to understand it." Graham thought he preached a gospel of stupidity and dullness, in opposition to the cleverness of faith and wisdom.

After a night spent in a monastery at Jaffa, some went by train and others walked to Jerusalem, besieged by Arab beggars and Turks who wished to carry bundles. At Jerusalem they obtained a place in a general hostel like a railway cloakroom. Jerusalem itself was a place of disillusionment; they passed through it, whispering prayers, making religious exclamations, in appearance jaded and woebegone, in reality feverish and excited with a pleasant feeling of brotherhood. They visited all the holy places, slept a night in the Holy Sepulchre, bought relics, bathed in the Jordan, and travelled north to Nazareth. 'Why the pilgrim goes there at all,' says Graham, 'seems a mystery; but all who do go wish to go again.' The scene on the banks of the Jordan must have been a strange sight as the peasants undressed and stepped into their shrouds to bathe in the river. In these now sacred shrouds they hope to be buried. The women had long robes like nightdresses; the men wore full white shirts and pantaloons. Those who came unprovided stood quite naked on the bank. The priest engaged in a service, and sanctified the water; the ikons and the cross were ranged around a wooden platform over the water. The priest called out, 'Come, ye thirsty, and take water gladly from the Wells of Salvation.' He bent down and scooped up water from the stream. Candles were lighted, and to the music of hymns, the towel-swathed cross was dipped first in the basin, and then in the river three times. At the dipping of the cross as many pilgrims as could bathed, crossing themselves and shivering. Men and women were mingled; there were no towels, and afterwards, naked, they stood or sat in the sun drying themselves. The pictures supply a realistic view of the strange occasion. 'It was a wonderful sight, that plunge in the life-giving stream, that rush from the bank of glittering lit figures into the strange little yellow-green river. For a whole hour there was a scene that baffles description, the most extraordinary mingling of men and women, all in white, dry and gleaming, or wet and dripping.

Typical pilgrims were Abraham, seventy-five years old, who was at Jerusalem for the twentieth time; and 'dear old dyadya' (uncle), fifty-five years of age, 'a gentle, reverent, innocuous, and outwardly seeming uninteresting pilgrim,' with whom Graham had intimate talks. Dyadya, when at Golgotha seeing the life-size representation of the crucifixion, bought a cross to take back, with other relics, to his native village. He suffered much from the night spent in the overcrowded Church of the Resurrection. He believed that all he heard was real as to the stone of anointing, the stone where Judas kissed Jesus, the real basin in Pilate's house, and that the sacred fire was

that actually received from heaven on Holy Saturday; also that the Bethlehem manger was the real manger, and that the pieces of the dress shown at Nazareth were really from that worn by the Virgin, and the planks those that Jesus planed. The journey from Jerusalem to Nazareth, though less than a hundred miles, is a hard one for the pilgrims on foot, but they are hospitably treated at all the monasteries on the way. The Imperial Orthodox Palestine Society has control over the hostelry at Nazareth, and gives free medical aid and more liberal supplies of food than those in Jerusalem. For threepence a day the pilgrim gets a typical village meal; if he cannot afford this, he can get a plate of porridge for three-farthings. After Nazareth the shore of the Sea of Galilee was visited, and the sites of Gadara, Capernaum, and Magdala. Then the return was made in gladness to Jerusalem, where seven thousand pilgrims had gathered for the ceremonies of Holy Week.

The author makes it plain that there is a world of difference between the outlook of the tourist upon Jerusalem and that of the pilgrims. 'The Russians have superstition, they are simple, they can be deceived, but they have life.' He concludes that if the Russian nation continues on the upgrade among the Powers of Europe the Sepulchre may fall into their hands, with all the duties of ministration at the shrines of Palestine.

Graham left on Easter Day, and was fortunate enough to get the last steamer that, owing to the outbreak of the Balkan war, was then allowed to pass through the Dardanelles. When at last Odessa was reached, and he heard again the language of business and pleasure, he felt that he was now far from the scenes of the simple faith of the pilgrims he had accompanied to Jerusalem.

CHARMS.

SIMPLE the charms that with wonderful power Stir the deep waters of memory's well; Fragments of song or the scent of a flower—Potent are these like some magical spell.

Back we are borne on the waves of remembrance, Scenes long forgotten grow clear to the view; Marvellous power hath some subtle fragrance To conjure up round us the friends whom we knew.

Faded old letters, grown yellow with keeping, Speak as it were with the voice of the dead, Charm us to laughter, or low, bitter weeping— Echoes are they from the years that are fled;

Ghosts from a time that is gone past recalling, Visions and spectres that rise as we gaze; Dim apparitions, with aspect appalling, Point to the folly of those vanished days.

Letters may burn, we may keep not a token, Naught to remind us of years long gone by; Music will haunt though the last link be broken, The scent of a flower bring tears to the eye. Frances A. Manks.

NERVES VERSUS HAPPINESS.

By ISABEL MACDONALD, D.N., A.R.S.I.

PESSIMIST has been described as 'a person who of two evils chooseth both;' but a neurasthenic chooses all the evils which find a place in a fertile but peculiarly morbid imagination. There is no condition more inimical to the happiness of home life, and more particularly to that of the person concerned, than a tendency to 'nerves.' It is one which should be combated from its earliest stages; but the dangers of giving way to it are rarely realised until the condition has gone almost beyond the individual's power to cure, even with the most sound medical advice and treatment. I can almost hear some one exclaim, 'Yes, precept is so easy, but practice, even in the early stages, so hard.' I quite agree that to overcome the tendency requires a tremendous effort of will, and will-power alone is not sufficient. Unselfishness, common-sense, sympathy, intelligence, hygiene, occupation, all these, and other factors as well, must come to the rescue.

I can remember the remarks of a friend of my own who suffered excessively from what she termed her 'nerves.' She appeared to be surrounded by all that heart could desire-a nice home, a husband who made her happiness his first care, bright, healthy little children, and numberless friends. Our conversation had arrived at the usual topic-her condition of 'Yes, auntie keeps telling me how lucky I am, and I know all that; but I cannot overcome this awful feeling of vague, overwhelming unhappiness. I keep on dreading that some one will be ill, or that we may not always be able to go on living in this pleasant, comfortable way. A hundred and one things I fear, and I simply live through days of heaviness in a kind of nervous dread of what life holds for me. No amount of trying will overcome this indefinable, vague anxiety, and it particularly overwhelms me in the early hours of the morning.' Poor lady, she had yet to learn that the greatest tragedies in life are those which never arrive. Yet a habit of meeting these phantoms is destroying the happiness and health of thousands of people in these strenuous days; and one still more pernicious than looking ahead for trouble is that of dwelling on the past. A fate more serious than that of Mrs Lot awaits those addicted to this, for they are in imminent danger of becoming pillars of nerves and living examples

of the futility of vain regrets. Better far to cultivate a spirit of self-forgetfulness, and be pillars of strength for those with greater burdens and sorrows. A healthy interest in other people's affairs is one of the best antidotes to 'nerves,' and one of the finest rules for mental hygiene is, 'Bear ye one another's burdens.'

I do not wish, however, to confine myself to what may appear to some to be mere platitudes; and there is no denying the fact that in these days our lives are strenuous to the point of overstrain. The pace of existence grows rapid and ever more rapid, more complicated, more exhausting; nevertheless, if we meet the demands of modern life in a sensible way, there is no reason why our nervous system need refuse to bear the strain. After all, it is worry, and not overwork, that is at the root of most cases of nervous breakdown. The habit of 'crossing the river before you come to the bridge' never avails much, and only lessens the power to overcome difficulties when they do arise. If we wish to preserve our own happiness, and that of others more or less dependent upon our mental barometer, it is well to grasp at their commencement the importance of such symptoms as irritability, depression, and self-pity. A determined effort should be made to overcome these, because the more frequently they are given way to, the more easily will our ideas travel back over mental tracks and connections, leading to the recurrence of such moods, and still harder will it be to resist them, until, at last, the 'nervy' habit is established, to the destruction of all real happiness, whatever one's worldly conditions. There is benefit untold to be gained from a determined effort to look on the bright side; though few can hope to attain to the heights reached by an American optimist who, falling from a thirty-four-story skyscraper, and having reached the thirtieth story, congratulated himself that he had got thus far safely.

Occupation is a valuable antitoxin to a nervous condition, for work is one of the best means of retaining mental elasticity. Many people, like the lady of my parable, complain of an excessive depression in the early hours of the morning. Then my prescription would be, 'Get up and do something.'

In dealing with this subject we can by no means neglect the physical aspect of the question.

MARCH 14, 1914.

No. 172.-Vol. IV.

[All Rights Reserved.]

Nervous irritability and depression are all too frequently the results of ill-health, and very often have their origin in some serious illness or incomplete convalescence. The condition may arise from some chronic ailment which does not appear sufficiently serious for medical interference until the mental state which it has aroused has become established.

Let us remember, too, the close connection between hygiene, particularly mental hygiene, and ventilation. There is no better tonic for the nervous system than pure fresh air. Good digestion is another matter of importance, and, incident to this, the condition of the teeth. Neither can we overestimate the value of an adequate amount of healthy exercise, taken for preference in the open air. Not only will this tone up the physical system, but it will rest those mental centres in use during working-hours. For the great brain machine is never at any time really idle, and when awake and not employed in some needed exercise or amusement it will, in brain-workers, often call into activity centres already overdone or others ever too liable to occupy themselves in pandering to that disease of the age—worry.

A KNIGHT ON WHEELS.

CHAPTER XIV.—continued.

TV

THE Studley masters were not a particularly gregarious body. The Head lived in secluded state with his wife and daughter in his official residence on the north side of the Close, emerging periodically to overawe the Sixth, preach in chapel, or discharge a thunderbolt in Big School. The Housemasters dwelt severally in their own strongholds, thanking Heaven that their Houses were not as other Houses were; and the Junior Staff lived round about, in cottages and chummeries and snuggeries throughout Studley village.

But once a week the whole hierarchy forgathered in the Masters' Common-Room and dined together. Usually the Head presided in person; and from the soup to the savoury every

soul present talked shop.

Schoolmasters appear to be quite unique in this respect. For three months on end they live in everlasting contact with boys. Sleepy boys confront them in those grisly hours of school which occur before breakfast. Restless and inattentive boys occupy their undivided attention from breakfast until luncheon. In the afternoon they play games with, or watch games played by, energetic and overheated boys. From four o'clock till six they stimulate the flagging energies of boys who are comfortably tired and inclined to be drowsy. In their spare time they lavish individual pains upon backward boys, or castigate sinful boys, or fraternise with friendly boys, or comfort unhappy boys. At the very end of the day they pray with and for all boys together.

A man who has never been a schoolmaster might be excused for supposing that when this overdriven band desisted from their labours and sat down to their evening meal they would turn with a sigh of relief to some extraneous and irrelevant topic—politics, literature, sport, scandal even. But no, they never talk of anything but boys—boys' work, boys' games, boys' pranks, boys' crimes, boys' prospects. They bore one another intensely, these excellent men; for just as no young mother ever desires to hear of or

talk about the achievements of any other baby than her own, so no keen cricketing coach will listen with anything but impatience to glowing accounts of his next-door neighbour's protégés. But they never desist. The shop varies, but boy is the only theme.

This weakness is not confined to schoolmasters, of course. All bodies of men of the same calling herded together for protracted periods of time are inclined to the habit, but most of them take elaborate precautions to eradicate it. In military and naval circles, for instance, certain subjects are taboo. Even undergraduates mulct one another in pots of beer if the line be crossed. But schoolmasters are incorrigible. They talk boy and nothing else. The explanation is simple. Boys are the most interesting things in the world.

Studley Senior Common-Room was no excep-At the top of the table the Head and his senior colleagues discussed high school politicsscholarships, roseola, and the latest eccentricity of the Governing Body. About the middle of the table, where Housemasters and form-masters were intermingled, a Housemaster would explain to a form-master, with studious moderation and paternal solemnity, that owing to the incompetence, prejudice, and spite of the form-master, a certain godly and virtuous youth named Jinks tertius was making no progress in his studies, and was, moreover, acutely depressed by the injustice with which he was being borne down. In reply to this the form-master would point out, in the most courteous and conciliatory tones, that the said Jinks was an idle young scoundrel, and that until the Housemaster abandoned his present short-sighted and officious policy of habitually intervening between Jinks and his deserts—to wit, the rod—no further progress could possibly be expected. Why couldn't Why couldn't Housemasters back form-masters up a bit? And so on. Lower down the table, three singleminded partisans were hotly disputing as to whether, upon a given date last summer, in a

given junior inter-form cricket-match, one Maggs (of the Lower Remove) did or did not feloniously give one Baggs (of the Upper Fourth) out legbefore-wicket at the instigation of a muscular bowler named Craggs. The only two persons at the table who were not talking boy were Mr Chigley and Mr Cleeve. Mr Chigley, between mouthfuls, complained bitterly and unceasingly of the food; while Mr Cleeve remorselessly conducted an inattentive audience, hole by hole, step by step, stroke by stroke, through the intricacies of a battle fought by himself against apparently incredible odds that afternoon, and of a victory snatched away on the last green. seemingly by the sudden and officious intervention of Providence, after what must have been one of the worst and most uninteresting exhibitions of golf ever seen.

Dinner ended, the company dispersed abruptly, summoned back from refreshment to the neverending labours of the schoolmaster, by house-prayers, scholarship coaching, or the necessity of administering justice. Mr Brett and two other Housemasters were invited by the Head to a

rubber of bridge. •

'By the way,' observed the great man as they cut for partners, 'you fellows must really see that your boys wear greatcoats on their way up to and down from football. Last Saturday I noticed four or five young idiots, in a most overheated condition, standing about on Big Side watching the Fifteen without so much as a sweater among them. It nearly gave me pneumonia to look at them. You and I, I think, Brett. We have choice of seats.'

'I think I will sit away from the fire,' said Mr Brett. 'My deal, I think. Will you cut to me, Haydock? Personally, I never permit any boy in my House to go up to the playing-fields without his greatcoat. Hearts!'

'My feeling in the matter,' said Mr Allnutt, on Brett's left, 'has been, and always will be, that we coddle boys a great deal too much. In my young days at'——

'Hearts!' repeated Mr Brett loudly.

'In my young days at Chiddleham,' pursued Mr Allnutt, quite unruffled, 'sweaters had not been invented, and'—he threw out his chest proudly—'we were none of us a penny the worse. Shall I play to a heart, partner?'

'If you please,' said Mr Haydock patiently. Mr Brett played the hand and won the odd trick.

'The nuisance about occasional apparel, such as a greatcoat,' said Mr Haydock, gathering up the cards, 'is that a boy wears his some wet morning up to school, and at the end of the hour, finding that the sun is shining, and being a forgetful animal, comes down without it. Net result—a greatcoat kicking about in a form-room till it is lost or appropriated. Your deal, partner.'

'It is merely a matter of taking a little trouble,' said Mr Brett precisely. 'Once boys have been taught to grasp the fact that rules

are made to be obeyed and not ignored, the thing is simple. My House'——

'Partner, I leave it to you,' said Mr Allnutt

fortissimo.

'No trumps!' said Mr Haydock.

'As a matter of fact, Brett,' observed the Head, as the dummy was laid down—he was a genial despot, and Mr Brett's pedantic fussiness was a perpetual thorn in his flesh—'the boys I saw on Saturday were yours.'

Mr Allnutt laughed loudly, and Mr Brett, greatly put out, omitted to return the Head's lead, with the result that his opponents made

four odd tricks.

'Game!' announced Mr Allnutt, quite superfluously. 'Thank you, partner. Pretty work!'

'It was a pity you did not return my diamond, Brett,' remarked the Head mildly. He was counted one of the great Headmasters of his time, but he was as human as the rest of us where lost tricks were concerned. 'I had the game in my hand.'

Mr Brett stiffly expressed regret, and continued, 'Would you mind giving me the names of the boys you saw? I simply can't understand it. I think there must be some mistake.

No boy in my House'----

'As a matter of fact,' said Haydock—he was the acknowledged peacemaker and mediator of the staff—'it is very difficult to get boys to wear their greatcoats. I can't help sympathising with them. They usually don't require overcoats at all, for they run straight up to their game and straight down again. But when, as sometimes happens, they find an exciting match going on on Big Side, they can't resist the temptation of waiting for a minute or two'——

Mr Allnutt interrupted. Listening to other people was not a foible of his. 'Nonsense!' he said with great gusto, as the Head began to deal the next hand. 'You can't tether healthy boys with red tape. Always disregard red tape, that's my motto!' By red tape Mr Allnutt meant instructions from headquarters which did not happen to meet with his approval. 'Now, my

boys'---

'Spades!' said the Head gloomily.

'Shall I play to a spade, partner?' asked Mr Haydock.

'Certainly, so far as I am concerned,' said Mr Allnutt. 'Glad to be out of it!'

Mr Brett, whose hand contained four aces, flung his cards upon the table and glared at his superior.

'Very sorry, Brett,' said the Head, 'but it had to be done. I had nothing above a nine in my hand. I was afraid they would double anything you declared. My cut, I think, Haydock.'

For the next ten minutes, fortunately, Mr Brett was too much chagrined to speak, and the topic of the overcoats was allowed to drop.

The game continued for another few rounds, with the luck fairly divided and the scoring low.

Presently the Head, who usually contrived to achieve a good deal of quiet legislation during these social evenings, remarked, 'We shall have to create three new school monitors at the end of the term. Have you any candidates, Allnutt?

'You can select any boy in my House you like,' replied Allnutt. He was habitually truculent to those set in authority over him-he regarded them as a humanised form of red tape—but the shrewd Head, who knew that Allnutt was a good man at bottom, suffered him with humorous resignation. 'They are all equally incompetent. Luckily I am in the habit of looking after my House myself, and not leaving it to half-baked policemen.

'Thank you,' said the Head. 'That leaves me with a comfortably free hand. Have you

any one to recommend, Brett?'

'Yes,' said Brett, 'I have. I have considered the matter most carefully. I have at least four boys who would make admirable monitors.'

'Game all!' said Mr Allnutt impatiently.

'Your deal, Brett.'

'And I have decided,' continued Mr Brett, bending his brows judicially, 'to recommend Ericson and Smythe.'

'Nincompoops, both of them,' observed Mr

Allnutt at once.

'I fancy Brett was addressing the Headmaster,'

said Haydock dryly.

'Oh, this is quite an informal discussion,' said Mr Allnutt cheerfully. 'The best boys in your House, Brett, are Meldrum and Lemaire. Why don't you recommend them?

With a great effort Mr Brett kept his temper. 'They do not happen to be House prefects, replied stiffly, 'and are therefore ineligible for

monitorships.

Much to Mr Brett's discomfiture, all three of his companions turned and gazed at him in undisguised astonishment.

'Why, man,' burst out Mr Allnutt, 'Lemaire is the most brilliant boy in the school!'

'His bodily infirmity'-- began Mr Brett

majestically.

'I see, I see,' said Allnutt. 'Bodily infirmity is a bar to promotion in your House, but not mental infirmity—eh? I suppose you have noticed that Ericson is a congenital idiot?'

Mr Brett, pursing his lips, began to deal the

cards with great stateliness.

'And what about Meldrum?' continued Mr Allnutt, following up his attack. 'He has more character than all the rest of your House put together.

'Unfortunately,' replied Mr Brett icily, 'he

has no brains.

Here Mr Brett made a serious blunder. He offended the only man in the room who might have felt inclined to protect him from the bludgeonings of Mr Allnutt. Mr Haydock happened to be senior mathematical master at

Studley, and, like all broad-minded men, hated anything like intellectual snobbery.

'Meldrum,' he remarked, 'is the soundest mathematician in the school, and quite the most brilliant scientist we have had for ten years.

'Possibly, possibly,' said Mr Brett;

does not affect my point. No trumps!'

Mr Haydock flushed red at this gratuitous piece of offensiveness. But he said nothing, and took up his cards.

'Shall I play to no trumps, partner?' inquired Mr Allnutt.

Mr Haydock glanced over his hand, and sighed to himself softly and gratefully. 'I shall double no trumps,' he said.

Mr Brett grew greatly excited. 'I shall re-

double!' he exclaimed.

'And I,' replied Mr Haydock gently, 'shall

double again.'

The Head, upon whom the asperities of the last ten minutes-since he might not take part therein himself—had begun to pall, sat up startled, and the game began—at ninety-six points a trick.

Mr Brett's hand contained eight spades, to the ten, knave, queen, king; the aces of clubs, hearts, and diamonds; and two small clubs. It was a tempting but treacherous hand, for singleton aces are but broken reeds.

Mr Haydock had nine hearts to the knave. queen, king; the ace of spades; and the king of clubs, singly guarded. His hope of salvation was founded on the sure and certain knowledge that Mr Allnutt would lead him a heart, for they conformed to the heart convention. Assuming that Mr Brett held the ace, the hearts could be established in a single round. After this he looked to his ace of spades or king of clubs to regain the lead for him. Of course if Brett held an overwhelming hand of diamonds the game was lost. There was also the possibility that Allnutt had no heart to lead. But there seemed to be a good sporting chance of success.

And, sure enough, the Fates-very justly, considering his recent behaviour to Mr Haydock -fought against Mr Brett. Mr Allnutt led a small heart; the Head, with a rueful smile, laid down a hand containing two knaves and a ten; Mr Haydock played the king; and Mr Brett, having nothing else, took the trick with the ace.

Then Mr Brett, scrutinising his hand and putting two and two together, broke into a gentle

perspiration.

The ace of spades—the one card necessary to give him every trick but two-was in the hands of the enemy. Still, eight spades to the ten, knave, queen, king, mean seven tricks once you have forced the ace out. Hoping blindly for the best, and pretending not to hear the contented rumblings of Mr Allnutt, the wretched Mr Brett played the ten of spades.

Mr Haydock promptly took the trick with his ace, and then proceeded to make eight tricks in hearts. After this he graciously permitted Mr Brett to make his other two aces and remaining spade.

'Three tricks,' said Mr Haydock. 'Game and

rubber.'

'Hard luck, partner,' murmured the Head heroically.

'What exactly,' inquired Mr Allnutt, brimming over with happy laughter, 'does three times ninety-six come to? Two hundred and eighty-eight? Thanks. What a lightning calculator you are, Haydock! A mathematician has his points, eh, Brett?'

(Continued on page 246.)

BULGARIAN ROSES AND ATTAR.

By GEORGE ADAMS.

THE clang of arms and the reports of fighting in south-eastern Europe have caused the beautiful and romantic kingdom of Bulgaria to loom largely in the public eye. Yet, on the whole, we know little of it. Comparatively few of us are acquainted, for example, with its interesting historical remains, the desperate struggles of the various races that have striven for the mastery of its soil, its abundant flora, its rich mineral treasures, or its magnificent rose-gardens and that exquisite natural perfume they produce.

An extensive portion of Bulgaria south of the main Balkan range is a region of roses, standing some thousand feet above the sea-level, and stretching southward to Philippopolis, the capital, a distance of about sixty miles in a straight line. From east to west it has a like extension. On all sides it is practically bounded by mountains, hills, stupendous rocks, passes, ravines, and precipices, with scattered forests of walnut, chestnut, and other trees. Altogether it offers a combination of charms the like of which is probably not to be found in Europe, if indeed in the world. Through it meanders the slow Tundja, a tributary of the Maritza, the river that flows past Adrian-ople. The Tundja has its source in a gorge of the Balkans, and flows for more than one hundred and seventy miles through an almost unbroken succession of defiles, valleys, and plains. It waters a tract of country about equal to half of Wales.

Roses are everywhere. They have bloomed there for centuries, but never so profusely as during the last two centuries. At certain seasons the air is almost oppressive with the scent of countless blossoms. Rose-gardens, large and small, lie in all directions, in the plains and val-leys and on the hillsides. They present a medley of whites, pinks, reds, and yellows, embedded in a mass of many-shaded leaves. The trees and bushes-many of them brought originally from various parts of the Old World, India and Persia having provided a goodly proportion of themare thrown together in wild, though happy, confusion. Roses abound, too, in yards and backgardens, on the walls of cottages and outhouses, and along paths and roads. They are as inseparably connected with the region as is Yarmouth with herrings and Newcastle with coal. Kazanlik and a score of hamlets and villages are buried in them.

In and around this huge rose-garden flourish, in well-nigh tropical luxuriance, yellow gentian, wild lilac of various tints, and many other flowers. Among these is the scarlet geranium, the favourite of the Bulgarian peasants. And all this is amid a blueness of sky, a wealth of sunshine, and a purity of atmosphere to which we in these islands are all but strangers.

Kazanlik is the world's greatest centre for the preparation of attar of roses and rose-water. Ages ago Persia and India supplied immense quantities of the former; but now their produc-tion has fallen very low. For some years France, Germany, and a few other states have manufactured a cheaper but inferior attar. Repeated experiments, however, have proved that no artificial product can equal the natural one. Kazanlik stands on a spot where the Balkan slopes end in the plain comprising a large portion of Eastern Roumelia. From a distance its appearance is striking. In the background is a range of majestic mountains, with imposing rocks and boulders, and miles of dark forest stretching towards the snow-line. At its foot are hills broken with clumps of trees and patches of fields, and rose, fruit, and vegetable gardens rising on the north-west to the famous Shipka Pass. One part of the town rises, terrace-shaped, on a declivity; the remainder advances towards a portion of the plain, rich in mineral springs and adorned with tumuli, some of which are quite twenty centuries old. The Kechidere, a small but picturesque river, threads through it before joining the Tundja. Above all tower the massive and gaudy cupolas of the Bulgarian churches and whitewashed minarets topped by gilded crescents.

The interior of the place partly dispels the enchantment lent by distance to the view. All the streets are badly paved and generally insufficiently lighted. Many of the lanes are paved only in parts or not at all. The quarter inhabited by the Turks closely resembles almost any part of Adrianople or the more purely Turkish section of Stamboul. The others are mostly a strange jumble of Bulgaria north of the Balkans, south Russia, and Greece; but in some spots Turk and Christian are more or less blended.

Lumbering country carts, seemingly constructed to cause the maximum of creaking, and drawn by oxen yoked in the manner of a thousand years ago, crawl to and fro. The driver usually walks before his cattle. His whip, when he has one, consists of a thin stick, two or three feet long, to which is fixed a cord of about the

same length.

The Mohammedan women display a certain uniformity of dress, generally black or dark in colour. The Christian women also largely follow one style; but they seek to outrival the glories of the rainbow, especially when they wear their Sunday best. Practically every style and colour, however, is sported by the men. If you have watched the crowd passing backward and forward over the Galata Bridge at Constantinople, you have at once a fairly good notion of what the men of Kazanlik look like, not to mention those of its environs.

Bulgarian rule has raised Kazanlik from a large, scattered, and sleepy village to a town possessing two high schools and several factories, one of which boasts of a solid local reputation for cloth. The town contains twenty-five thousand inhabitants, of whom about one-tenth are Turks, while as many belong to other nationalities.

The rose-gatherers are mostly women and children, working in gangs. According to the district, they are paid by the hour, by the quantity plucked, or by the area worked. To them rose-picking is equivalent to 'hopping' among the Kentish country people and the denizens of the East End of London. Operations commence betimes in the morning. Whenever possible, the flowers are gathered only in cool weather and in the forenoon; a hot sun, it is said, deprives them of half their sweetness. How far this is correct need not be discussed here. In some places the close of rose-plucking

time is marked by rejoicings, in which drinking, singing, and curious styles of dancing by groups of women play a conspicuous part.

Except in a few rare cases the distilleries and methods of distillation are equally primitive. The average Bulgarian owns the house he lives in, besides a plot of land and a few head of cattle; but his supply of cash is usually limited. Like most small landlords, he is strongly conservative, and thrifty almost to the point of avarice. Further, generations of Ottoman domination have taught him to cling tenaciously to his money. Thus he rests content with his small and old-fashioned distillery in a shed or backyard, and fails to grasp how expenditure for improved appliances would increase his returns.

Attar is exclusively obtained from young roseleaves. The quantity required varies considerably according to the kind of rose. On the average, however, from one thousand five hundred to two thousand buds provide one ounce of the perfume. After the distilled liquid has stood for two or three days, the attar, a lightyellow oil, rises to the top, and is immediately skimmed off. One pound weight of it costs from fifteen to twenty pounds. At the beginning of the present century nearly nine thousand pounds weight of it were exported annually. This total has probably been much exceeded, as the demand is ever increasing for industrial purposes; but trustworthy statistics are not available. Approximate calculations, however, show that the quantity sent abroad in the twelve months preceding the two recent wars must have amounted to some twenty-four thousand pounds weight. This enriched the south Bulgarian peasantry by close upon half-a-million pounds sterling.

A MARRIAGE OF CONVENIENCE.

CHAPTER III.

THE simple life,' said Henry; 'how delightful it is! What liquid blended by man can compare with this delicious natural element? Princess, I pledge you in water clear and sparkling as your eyes, sweet as your voice, pure as yourself—and cold as your heart.' He drained the cup of his hunting-flask, which he had filled at the rill flowing at their feet; then, stooping, washed the metal cup, and offered it, brimming with the limpid spring water, to Stephenie.

'Water,' she reminded him, returning the empty cup, 'is unstable, and it can be treacherous. Sometimes it kills its votaries.'

'Not if they can swim.'

'Many swimmers have been drowned. Remember the fate of Leander.'

'That happened,' he pointed out, 'a good many years ago. But you are out of spirits to-day. Why?'

The two stood on a plateau of rock some

thousand feet above the plain, where, looking like pygmies, waited their retinue and horses. Henry enjoyed these excursions and picnic-lunches taken in Stephenie's society. He enjoyed the freedom of the mountains, the escape from the duties and ceremonies of his rank. He felt like a schoolboy on holiday. One drawback only was While he was falling more and more in love with Stephenie, she was deaf to his pretty speeches, her heart as cold to him as the water to which he compared it. He counted it for nothing that he had erected a certain atmosphere of camaraderie in their relations. Friendship and love may lie close as parallel lines on a blackboard, and, like parallel lines, never touch. To-day Stephenie was not herself. She had been very silent all the morning as they rode side by side, with her lady-in-waiting and his gentleman fifty yards in the rear, and the escort of an officer and two armed soldiers-which Queen Margaret insisted on their taking-another fifty yards behind.

They had climbed some way up the mountain, bidding the little retinue wait below and unpack the luncheon-basket, and now stood looking at the panorama outspread like a map before themthe plain they had ridden across, and in the distance the towers of the castle glittering golden in the sunshine.

The Princess, slim and graceful in her ridinghabit, met his glance doubtfully, and looked down; her colour came and went; she plucked idly at her whip; then, raising sad eyes, she said, 'I am troubled about you. I—I wish to warn you'—she spoke with intense reluctance, and Henry's look questioned her, but he remained silent-'to go away.' Suddenly her tongue became loosened, and the words came quick and 'Make some excuse and go away at once. fast. And then break off the engagement.'

'You ask me to do this?

'I beg you-for your own sake.' She came a step nearer, and, though they were so utterly alone, whispered the next words as if fearing to be overheard: 'Your life is in danger. Ask me no questions; only believe I speak the truth.

The King's face hardened into flint. at the bottom of his heart he had distrusted Margaret, and yet treachery seemed inconceivable. He was her guest, had eaten her bread and salt. Moreover, she dared not let harm befall him. His country would exact a terrible retribution. 'You must tell me more,' he said. 'I can keep a secret. How do you know my life is in danger?

Stephenie told him, against her will, for he dominated her. Unstrung, after a sleepless night, she could not deny the interrogation of voice and eyes. Possibly it was a relief to unburden her bosom of the secret it held. The night before, by accident, she had overheard the Queen speaking to a trusted maid—just a few words—as she stood an unwilling and unseen listener behind a curtained doorway; but the purport was a frank joy that King Henry's doom was at hand. In a few days at most he would be dead, said the Queen.

With lowering brows, King Henry listened. The grim tale bore the impress of truth. And did not the blood of that Queen who wrote the day of St Bartholomew in letters of blood in the history of the world run in Margaret's veins?

But he would not believe.

'You must have misunderstood her. I know she doesn't like me; but to compass my deathimpossible! Politically, leaving ethics out of the question, the deed would be folly. Princess, your fears run away with you. I am in no danger.'

He repeated the words under his breath as he turned away, and, stepping to the edge of the plateau, looked down. Politically the deed would be a folly. In no way could Margaret contrive his death and free herself from blame or her country from punishment; in no waydenly a thought illumined the darkness of his mind. Yes, there was a way! He caught his breath sharply, and fear, though not for himself, laid a cold finger on his heart. There was danger in the air; the very breeze carried a premonition of it. And then the crack of a rifle turned suspicion to certainty. It came from behind a spur of the mountain several hundred yards to the right; it was followed by a dropping volley of shots, directed at the little group below. Of the five tiny figures gathered together, three immediately became animated, while two lay very still. But the splutter of musketry continued, and one after the other the tiny manikins ceased to move, and five separate blotches lay like dead flies against the pale brown of the earth beneath; while the hobbled horses, untouched, neighed and plunged in panic terror. The firing ceased. And only two minutes before he had told Stephenie he was in no danger! Death was in the air, not only for him, but for the girl by his side.

Her hands were gripping his arm convulsively, her white face close to his as he turned, white to the lips also. 'What has happened?' she cried. 'Who is firing?' Mercifully, she had

seen nothing.

'It's a Syvian raid,' he answered; and with that—crack / crack / crack / and a bullet broke in two the eagle's feather Stephenie wore in her hat; another tore the cloth on his right arm. Unseen marksmen were firing at them from the lip of a crag a couple of hundred yards away. But by stepping back a pace, which they promptly did, a jutting rock gave them protection.

King Henry carried a revolver. His premonition of danger was only two minutes old, and he had smiled at the escort which, by the Queen's command, followed him in his excursions; but, a crack shot, to amuse Stephenie, almost every day he gave her an exhibition of marksmanship, one of his suite tossing coins in the air for him to fire Thus fortune so far favoured him that he possessed a weapon, and could at least die fighting, if die he must. As he drew it his eye wandered, seeking a more suitable spot to sell his life to the best advantage than the overhung path where they stood. Some thirty paces farther he marked a cleft in the rock, and hastened to it, drawing his companion with him.

To his joy, the aperture, just wide enough for one to enter, opened into a small cave. He thrust

Stephenie in, and followed.

The cave extended some dozen feet back, and they heard a faint drip, drip of water percolating through some flaw in the rock, silenced almost immediately by the savage shouts raised by the Syvians charging up the path in search of them. The first half-dozen mountaineers ran past the cave; but discovery was inevitable. One, pausing, peered in and spied them; and a second later he pitched forward dead, his body blocking the entrance, the shout of discovery expiring unuttered on his lips. But the pistol-shot advertised their hiding-place, all the same.

In the flush of their onset the Syvians tried to take the cave by assault; but it was one of those occasions when a man with a revolver is equal to an army. The enemy could only enter singly, and, owing to the lie of the rock, could not fire into the cave unless directly in front of it, and the path without was narrow. Henry fired thrice, each time taking a life; and, leaving the bodies lying, the mountaineers drew out of range of the deadly firearm.

The King reloaded, wiped his hot face, let his tense muscles relax, and turned to Stephenie. 'You are not hurt?'

'No, no!' she answered. 'What does it all mean? And what has happened to the others?

'They are-captured,' he said. He knew all, including Baroness Arnheim, were dead; but it would serve no good purpose to tell her. And he fancied the ruthless wiping out of their retinue foreshadowed their own doom. If Margaret, as seemed likely from Stephenie's story, was behind their assailants, she intended to sacrifice them The girl's death, unmarried, meant that the rich silver-mines of Fürst would revert to the Crown-in other words, to Paul. And if Stephenie died with him there would be no retributory war; the two nations would sorrow in unison. Thus at a stroke the Queen would achieve the vengeance she had long nursed, and at the cost of a niece she secretly hated, gain immunity for the deed and wealth for her son.

But this was all surmise. Yet the truth was easy to learn. Henry raised his voice, and, using the Syvian patois, with which he was acquainted, demanded to speak to the leader of the attacking

party. Presently a voice answered.

Stephenie, who was ignorant of the language, listened in puzzled silence to the dialogue that ensued. But that the news he learned was bad his grim, set face told when it ceased. And suddenly she remembered it was her father who had led the punitive expedition into the Syvian fastnesses thirteen years before. That almost forgotten fact now assumed a sinister significance. Abruptly she said, 'Is it our lives they seek, or is it a question of ransom?'

Henry could not tell her the truth, could not meet her mute, questioning glance. Obliquely he answered, 'He declined to discuss ransom. But I have about fifty cartridges, and for a while we are safe here—till nightfall at any rate.'

'But what hope of rescue have we?'

'A slight one. Stephenie, it would be cruel to buoy you up with false hope; but there is hope, though not from Istafel, for the end will come one way or the other before a search-party from the castle sets out to seek us.'

'Then where'-

'From the air. While we were on the plateau I looked south towards Saarland, and high up I saw something in the air, something too big for a bird. And I saw it yesterday. I think it is an aeroplane watching over me.

'Then will that come to our rescue?'

'No; but Tamur is only twenty miles away. Suppose mind this is only a supposition—Hannemann has stationed a cavalry regiment there? He feared danger for me from the Syvians. It's quite likely he has been having me watched from an aeroplane during our daily rides. And, if so, the aeroplane would be in wireless communication with Tamur. They will know now that the Syvians are on the warpath, and their King dead or in the utmost peril.'

Stephenie nodded gravely; and after a pause

she asked, 'Are you thirsty?'

'Yes; but I dare not leave my post. They

may attempt to rush us at any moment.'

The rill, a very tiny one, trickled through the cave. The Princess stooped over it, and, rising presently, came to him, her curved palms brimming with water, and he drank from her hands. Hardly had he finished when she gave 'I had forgotten there is the ghost of a laugh. a cup to your flask.'

'Princess, it is sweeter thus,' he answered gallantly. Then, in another tone, catching her right hand with his left, he said, 'Stephenie, one thought tortures me. I have brought you to this peril—I, in my selfish desire to win you. If we escape I swear to annul the engagement. shall marry whom you please or not at all.'

'Do not reproach yourself. I am not afraid. You give me courage. I believe rescue will come.'

It was pleasantly cool in the cave, and from their unseen but lurking foes came no sound. Henry lay down, propping his revolver on a stone and venturing to rest his fingers. Time went by. He wondered what the Syvians were doing. Luckily they were only armed with muskets and pistols of antique pattern, and knives. Had they possessed hand-grenades or bombs, neither Stephenie nor he would be alive. But when night fell, at the cost probably of one life, they would force the entrance. He did not think they would attack earlier. They had them as safely as rats in a trap. And he wondered—for life is sweet-whether rescue would come in time.

Stephenie crouched on the ground a little in the rear, their shoulders almost touching. They spoke little, and on trivial topics only; but there was a sense of intimacy between them hitherto

lacking. And so passed two hours.

They were not taken by surprise when the attack came. Their senses, preternaturally acute, heard danger in the air. King Henry was ready, while Stephenie, behind him, held the cartridges; but the scheme was well laid, and—pushed a little more resolutely, for the revolver only held six shots—might have succeeded.

From each side a man armed with a knife bound to a sapling sprang at the opening; others with levelled muskets or pistols followed, firing into the cave and yelling as they fired. Henry answered swiftly, shooting first one spearman, then the other; but for all his speed the second had time to lunge, and the blow fell on the King's uplifted left arm, ripping the flesh from wrist to elbow. The cave was full of smoke, and through the screen of it the savage faces of the mountaineers showed at the opening. Again and again Henry fired, then swiftly took the cartridges Stephenie proffered and reloaded. But the fight was over; the entrance was blocked with dead or wounded men; and the rest—shrinking from the deadly marksman within, who, sheltered behind a spur of rock, remained invisible—drew sullenly away. Victorious, but sick and faint, Henry leaned against the side of the cave, the blood dripping from his arm.

Silent and apathetically he let Stephenie minister to the wound and lave his face with water. Then, as the bleeding ceased and the arm was tightly bandaged, the feeling of nausea and the trembling at the knees passed; but for two or three minutes he was hors de combat, and the Syvians, if they had only known it, had them at their mercy. He looked at her, smiling faintly.

'Rescue is at hand,' he said. 'They see my dragoons coming. They would never else have attacked by daylight. Courage, my Princess; we will win through yet. Ha! what are they up to now? Brushwood? Luckily it is too green to burn.'

The Syvians had been collecting everything burnable at hand, and now thrust boughs forward to block the opening. But the brushwood, when set fire to, scarcely smouldered.

They attacked again, reckless of their lives, using the slain bodies of their comrades for shelter; but their shots pattered harmlessly against the back of the cave; and Henry, shooting from one side, fired at every face and hand and arm that showed itself, and soon the fighting slackened, for the leaders of the expedition were dead or wounded. Suddenly, from the plain below, a bugle, clear and shrill, sounded the attack. The dragoons were at hand.

'We are saved!' said Henry.

The dragoons were coming up the path, panting through clenched teeth, and spent by the terrible twenty-mile ride, but not too spent for this final effort. With swords and pistols in hand, they ran clumsily in their heavy boots, their spurs jingling on the rocks. Savage as bears robbed of their young were the troopers; on the plain below they had seen the dead body of Captain Hesselrigg, the King's aide-de-camp, and those of the rest of the retinue, and the sound of the firing above told them that perhaps their loved King still lived.

Lived! King Henry met them in the narrow path, reeling, staggering, leaning on Stephenie's arm—his face black with powder and stained by blood, for in the last mêlée the Syvian knives had reached him—but able to smile at his deliverers before he pitched forward in a faint into the arms of the foremost trooper.

Stephenie saved the wounded Syvians, of

whom nearly a dozen were captured, and who but for her interference would have been put to the sword. 'Enough blood has been shed,' said the Princess; and Henry, when he returned to con-

sciousness, heartily agreed.

Nor was it only human lives that paid the price of Margaret's crazy thirst for revenge. Scores of horses died also, and the sight of the dead animals marking the road to Tamur, dying that she might live, haunted Stephenie for many a night to come. For no man spared his steed in that historic ride, and scarcely a horse that carried a trooper from Tamur to the foot of the mountain was fit to ride again. Nor was one ridden; for, by the King's command, the survivors range at liberty on one of the royal studfarms, spoiled pets, visited and fed and caressed by the populace on national holidays, the real saviours of the King and Princess; for not a trooper, to the secret shame of the regimentso swiftly did the unwounded surviving Syvians flee—lost a drop of blood in the rescue.

A week passed before Henry and Stephenie met again; and then the King, newly risen from bed, was a much-bandaged man; but it was the debonair monarch with whom she was familiar who bent over her hand.

'I kiss the hand of the bravest as well as the most beautiful of women,' he said.

But there were tears in Stephenie's eyes.

'I know I look a wreck; but the doctors promise to restore me as good as new to my subjects for the Thanksgiving Service. You are scathless'——

'Thanks to a brave man.'

'Madame, it will ever be the proudest day of my life—the day I fought and slew the dragon and rescued the Princess. But enough of myself. Hannemann returns from Medena to-morrow to head the escort which will take you back.'

Much had happened in that week. Syvian chiefs, repudiating the raiders, had met the punitive force, offering the survivors of the attack as prisoners. The captives laid the blame on Queen Margaret, who they swore instigated it, heavily bribing two minor chiefs to kill King Henry and Princess Stephenie. Of course the Queen's doctors explained away this damaging fact in a cloud of words which meant in plain language that the lady was mad; but it was fortunate the Queen solved the difficulty by accidentally-at least that was the word usedtaking an overdose of chloral. Death pays all scores, and Soldavia gave the Queen Regent a handsome funeral (General Hannemann represented Saarland at the ceremony), and promptly put her out of mind.

'We will formally break off the engagement as soon as you are back in Medena,' Henry continued. 'I have spoken privately to your Ambassador and one or two other dignitaries, explaining it would only have been a marriage of convenience, and that, on second thoughts, we have decided not to fulfil it.'

'You-you are very good.'

'Not at all. A King's word. You are free, Princess; free, rich, independent.'

'It won't mean bad blood between the nations?'
'Not a bit. Margaret's death makes all the difference. There will be no ill-feeling on either side. Count Zunger is already drawing up a commercial treaty between us and Soldavia.'

commercial treaty between us and Soldavia.'
'But,' she said, 'it makes me an ingrate. You have slain the dragon, and get'—she smiled at

him-'nothing.'

'Nothing! I get a memory that will never fade in my heart. I get, I trust, your friendship.'

'But don't you want more?'

The King started, and looked hard at her. His gaiety fell away like a cloak, and the natural man appeared.

'Madame!' he began. And then, 'Stephenie, why do you look at me like that?' His voice shook with emotion. 'Is it possible you have changed—you whose heart'——

'Was cold as the stream. But water can be

warmed, and hearts can change.'

She stood before him, his Princess, slim and straight and fair to see, and very desirable, with her elusive, nunlike air, her long lashes veiling her eyes; and he put out his uninjured right hand, slowly, hesitatingly, as one touches something infinitely precious, and drew her close to him till he could feel the warm, throbbing life of her, and still he could not believe. 'I love you, Stephenie,' he said; 'but you—you—look me in the face and tell me: will it be a marriage of convenience?'

'No, no, no!' cried Princess Stephenie.
THE END.

THE PLAGUE IN SCOTLAND.

By Louis A. Barbé.

UP to the middle of the fourteenth century, Scotland, owing, it may be assumed, to the temperate habits of the people, as well as to the salubrity of its climate, was free from the plague, that awful scourge which, in other countries, had long been dreaded as one of the chief causes of the misery of the people. It is especially noted by the biographer of St Columba, and repeated by Buchanan, that even in the seventh century, when the pestilence which afflicted all Europe spread through south Britain, the inhabitants of the northern part of the island were alone spared the direful visitation. Its first appearance is chronicled by Wyntoun, under the date of 1349:

In Scotland the first Pestilence
Began, of so great violence
That it was said, of living men
The third part it destroyèd then;
After that within Scotland
A year or more it was wedand [raging].
Before that time was never seen
A pestilence in our land so keen;
Both men, and bairnies, and women,
It spared not for to kill them.

Some additional details are supplied by Fordun, who states that 'by God's will this evil led to a strange and unwonted kind of death, insomuch that the flesh of the sick was somehow puffed out and swollen, and they dragged out their earthly life for barely two days. Now this everywhere attacked especially the meaner sort and common people; seldom the magnates. Men shrank from it so much that, through fear of contagion, sons, fleeing as from the face of leprosy or from an adder, durst not go and see their parents in the throes of death.'

There can be no doubt that this terrible epidemic disease was the black death. It came from the East, whence its devastating progress

can be traced until its appearance in Dorsetshire in August 1348. It soon spread through the whole kingdom. For a time its progress was arrested by the Scottish Border; and 'the foul death of the English' is said to have been at the time a favourite oath with the Scots, who felt a malicious pleasure in the calamity which had overtaken their old enemies. It was they themselves who, by making a reckless raid into England, brought the black death into their own country, where the mortality which it spread is probably not overestimated by Wyntoun. In 1362 there was a new outbreak of the 'death sickness.' Fordun states that it raged exceedingly throughout the whole kingdom of Scotland. and that it was in all respects like the earlier visitation, both in the nature of the disease and in the number of those who died. Wyntoun contributes the further information that it began at Candlemas, and continued to the Yule or after, and that King David and the Bishop of St Andrews, with their respective suites, retired, the one to Kinloss, in Moray, the other to Elgin, and remained in the purer air of the north land all the time that the 'Dede' was desolating the south. From the fact that Wyntoun devotes but two lines to the mere mention of the third pestilence, it may be assumed that this visitation, to which he assigns the date 1380, was less disastrous in its results than either of the two former. Of the next, however, that of 1401, he says that it was

> More fearful than memore Was had of the three before;

and the reason which he gives for this statement is that, whereas the spread of the disease had hitherto been gradual, on this occasion 'it would overtake all lands' at the same time. Thus, as he grimly expresses it,

That pestilens gart mony banes In kirk-yardis be laid at ance.

When the pestilence again appeared, fifty years later, it had assumed so wholly different a character that Bower calls it 'pestilentia volatilis.' The name seems to be fully justified by the few details that are to be gathered as to its progress. Having first appeared in Edinburgh in 1430, it continued its deadly work till, at least, the year 1432, when there is record of its having raged in Haddington. Its erratic nature may further be inferred from the fact that the Parliament which was held in Perth in 1431 enacted that the collectors of the land-tax should present their accounts in that city on the 2nd of February next to come, provided the pestilence were not there; but if it were there, at St Andrews.

In the course of the sixteenth century there were several plague-scares, a considerable number of minor and mainly local outbreaks of the dread disease, and at least one visitation hardly less terrible in its results than the 'great mortality' of 1349 had been. It continued for fully four years. As was very frequently the case, it came from over the sea; and a 'creare,' or cutter, which arrived at Easter Wemyss in 1584 was believed to have been the first cause of it. 1585 it was at its worst in Edinburgh. was reported as raging at Niddrie in 1586; and in the following autumn, Leith, which had been amongst the first of the Firth ports to suffer from its ravages, was, after a short respite, again devastated by it, owing to the 'opening of some old kists.' Not till the month of December of that year was the Privy Council able to announce that the country was at length free from the fearful scourge, and that the College of Justice, which had been transferred to Linlithgow, was to resume its sittings in the capital. Calderwood states that in 1585 some twenty thousand persons died of the plague in Edinburgh alone. That is obviously an exaggeration. Robert Birrel's estimate is far more moderate. He reports that of those who were unable to flee when first it was known that Simeon Mercerbank's house was infected, there succumbed one thousand four hundred and odd, a number more in proportion to the mortality of Perth, which the chronicle of that city sets down at one thousand four hundred and twenty-seven, and of St Andrews, where Moysie records that 'upwards of four hundred people died.' As to the desolate appearance of the capital whilst the plague was raging in it there is the testimony of James Melville, who passed through it in November, on his way from Berwick, where he had been living in banishment for a time, to a General Assembly which was to be held in Linlithgow. 'We came riding in at the Watergate,' he says, 'up through the Canongate, and rade in at the Netherbow, through the great street of Edinburgh to the West Port, in all whilk way we saw not three persons, sae that I miskenned Edinburgh, and almost forgot that I had ever seen sic a town.'

If the most effective of preventives, sanitation, was practically ignored by municipalities no less than by individuals, the Government displayed considerable zeal and vigour in its efforts to prevent the introduction of the plague when it became known that it was prevalent in any country with which Scotland held intercourse. If the northern counties of England were affected, instructions were sent to the Wardens of the Marches to prevent Englishmen from crossing the Border, and to charge Scotsmen 'that none make market with Englishmen in those parts, nor have intercourse, nor intermingle with them because of the pestilence.' Disobedience of the orders issued for the purpose of stopping all traffic and communication between the two countries was to be punished with death. The fairs held periodically in such towns as Duns and Kelso, to which people of both nationalities were wont to resort, were also prohibited. With respect to merchants coming from infected or even suspected ports, it was ordained that they should contain themselves and their goods within shipboard, or at least proceed to some quiet place where the lieges could have no 'company or melling with them.' For members of the crew to come within any 'burghs, towns, or common passages' until they had been declared free from infection was made a capital offence. A ship hailing from the Baltic would probably have a cargo consisting wholly or in part of flax, pitch, tar, iron, and ashbarrels. In that case, because the most danger appeared to be amongst the flax,' it was to be unloaded and housed on St Colm's Inch, opened, handled, and cast forth to the wind every other fair day, for from six to eight weeks. The other goods were to be cleaned by 'overflowing of the sea, at one or two tides.' The ash-barrels were to be singed with heather set on fire; whilst the ship itself was to be bored so as to let the seawater into it. And all this was to be done at the expense of the owners. The sailors and others who handled the goods were to be cleansed and set apart by themselves for a time on one of the islands in the Forth, at the discretion of the official inspectors. Even after all these preventive precautions had been taken, they had to obtain a special license from the magistrates before attempting to hold intercourse with the lieges. If it happened that a 'foul' ship entered a Scottish port, the local authorities were required to 'search, seek, and apprehend the masters, skippers, and inbringers of it, and put them in sure firmance and captivity, and hold and detain them therein until order were taken and commandment given to execute justice upon them.' In all adjoining burghs proclamation was to be made that 'none suffer or permit any of the aforesaid persons or their goods to come on land, or otherwise to reset or grant unto them meat, drink, house, or harbrie, or have any manner of communication with them, under whatever colour or pretence,' under pain of death. Should any have got away and found refuge already, they and their resetters were to be apprehended, the houses to be closed up, and 'themselves to be execute incontinent to the death.'

When, in spite of these preventive measures, the plague broke out in a seaport, the first care was to cut off all communication. If there were a ferry service, as, for instance, between the north and south shores of the Forth, the boats were forbidden to ply, and, if necessary, actually dismantled to enforce the prohibition. In respect of inland intercourse, the panic ordinances passed by local authorities were often contradictory to each other and inconsistent with the enactments of the Government.

Whilst the Privy Council endeavoured to restrict travelling by wholly isolating certain localities, or by requiring passes in the case of others, individual municipalities would not allow pipers, fiddlers, minstrels, or any other vagrants to remain within their boundaries without the special leave of the Provost, under pain of a scourging, and would drive all 'poor common beggars' forth to their own parishes, by threatening to burn them on the cheek if they were found within the burgh twenty-four hours after due proclamation had been made. Notwithstanding all orders to the contrary, when the pestilence was known to have penetrated into one of the larger towns, the chief concern of the 'substantious gentlemen, burgesses, and other inhabitants' who could command the means was to remove themselves as far as possible from the centre of infection. In consequence of this, the poor were left 'destitute of all comfort and provision for their maintenance,' so that many of those who died perished 'rather through lack of sustentation than of the said plague.'

At the great outbreak of 1585, James the Sixth, with characteristic pusillanimity, headed the exodus of the panic-stricken. He first retired to St Andrews, but remained there only a short time, 'understanding that the pestilence had reached the place of his present residence.' Before leaving the town, however, he issued one reasonable order, to the effect that 'all filth and filthie beasts or carrion be removed furth of the highways, and the same cleansed and holden clean.' Having then gone for safety to Falkland, he commanded that, within six hours, and under pain of death, all that were not properly dependent on some particular person requisite to attend on the king's service, or that were not otherwise entitled to be in the town by special leave or occupation, should depart to their own dwelling-Within a month 'the suspicion of the pestilence lately entered at Falkland' caused him to remove to Stirling. The manner of his ignominious flight is recorded by Moysie. He was hunting at Ruthven when 'word came that there were five or six houses in Perth affected with the plague, where his majesty's servants were for the time. Whereupon, his majesty departed the same night, with a very small train, to Tullibardine, and next day to Stirling, leaving his whole household servants enclosed in the place of Ruthven, with express command to them not to follow, nor remove forth of the same until they saw what became of them upon the suspicion.' In such wise did King James show the sincerity of his belief in his own philosophical remark that 'the pest always smites the sickarest such as flies it farthest and apprehends deepliest the peril thereof.'

Maister Gilbert Skeyne, Doctour in Medicine, who wrote Ane Breve Description of the pest of 1586, and who had been induced to do so by 'seeand the puir in Christ inlaik [succumb] without assistance of support in body, all men detestand aspection, speech, or communication with them,' has given a sad picture of the inhuman selfishness which such a visitation engendered. 'Every ane,' he says, 'is become sae detestable to other (whilk is to be lamentit), and specially the puir in the sight of the rich, as gif they were not equal with them touching their creation, but rather without saul or spirit, as

beasts degenerate frae mankind.'

Such measures as were adopted by the local authorities were intended to prevent the spread of the disease rather than to relieve those already stricken by it. Under pain of death, the master of a house in which any person fell sick was to report the case immediately to the visitors or searchers. All the members of the family were then compelled to remove to a plague camp, situated in some outlying part of the burgh, where they were housed in wretched 'ludges,' or huts, hastily run up for their accommodation, and where they might be, but seldom were, visited by their friends, accompanied by an official, after a certain hour in the morning. some cases the landlord of the house lately inhabited by them was required to burn it, as well as their goods, without delay, with 'absolute exoneration' to himself for so doing. In others they were allowed to take their furniture and belongings with them; and it was deemed sufficient to get the 'land and rooms' from which they had been taken cleansed 'by water and fire.' This was to be done between the hours of nine o'clock in the evening and five in the morning. The charge for it was fixed at ten shillings, which 'substantious' citizens were expected to pay themselves. In the plague camp the clothes of stricken or suspected persons were disinfected by being boiled in a large caldron in the open air. The due carrying out of these plague regulations was under the supervision of two bailies, specially appointed for the purpose. Like the cleansers and bearers of the dead, they wore a distinctive uniform, consisting of a gown of gray stuff, with a St Andrew's Cross both before and behind.

For the removal and burial of corpses, a grim and ghastly ceremony which was performed under cover of night, there were to be provided 'twa close biers, with four feet, covered over with black and ane white cross, with ane bell to be hung upon the side of the said bier, which sal

make warning to the people.'

Within a burgh where the plague had broken out a belated attempt at sanitation was made, to the extent of forbidding the owners of dogs and swine to allow the animals to wander at will, and of empowering any one who encountered these 'in high streets or vennels' to kill them. Meetings of all kinds were prohibited. Thus, in Edinburgh, Parliament was prorogued if sitting, diets of the Court of Justiciary were suspended, and the administration of the public business generally transferred to some town that had remained 'clean.' No one might hold school under pain of banishment; and children of less than fifteen years of age were liable to be put into the stocks and to be scourged with rods if they made use of their enforced leisure to play on the gaitt or in the streets or in the kirk.

It being made a capital offence for the des-

titute of any plague-stricken locality to wander about begging their living as usual, the 'magistrates, barons, gentlemen, and other honest men' of the parish were called upon 'of their charity' to make provision for their maintenance; and, if voluntary contributions were insufficient, recourse might be had to special taxation.

There is no reason to believe that Scotland was more grievously stricken during the second half of the sixteenth century than it had been in earlier times; but the information to be gathered from Acts of Parliament and of the Privy Council, from burgh records, private diaries, and contemporary memoirs becomes fuller and more detailed. It supplies data from which the calculation may be made that the plague years, in the aggregate, covered at least a third of the whole period. It shows that what is but a remote contingency at the present day was a constant terror then; and it brings home the fact that pestilence, with its usual sequel, dearth, must be taken into account as one of the causes to which the poverty of the country and the lamentable condition of the lower classes are to be attributed.

THE LAIR OF THE PIKE.

By R. W. Burgess.

THE summer is over; my cherished cane rod, gossamer tackle, and dainty flies that have served me well and truly during my summer wanderings, taking toll of the gallant trout from many a river and lake, have been laid by. That glorious evening on Blagdon Lake, when the four-pound trout were rising freely; those strenuous days of wading the swirling waters of the Barle and Exe in the west country, where the fish run small and the pound trout is the limit of one's hopes; the long hours of careful stalking from the bank on the more placid waters of the Colne, where dry fly is de rigueur and the fish are highly educated—these are now but glowing memories to be treasured during the dark days of winter.

The water still calls to me, however; and although the trouting is over and the bobbing float of the patient roach-fisherman has no power to charm me from my fireside, the hungry pike, with appetite sharpened by the early frosts, will now have left his lair among the weeds and be seeking whatsoever he may devour.

seeking whatsoever he may devour.

The air bites shrewdly as I start my threemile tramp to the water. The sky is faintly blue, and a pale, spectral sun gleams feebly through the drifting vapour, giving promise of better things to come. The bare hedgerows and the grass blades are touched with hoar-frost; but the ground is soft and wet underfoot, and the air is charged with that subtle scent of decay that marks the border-line between autumn and winter. Through pine-wood and over sandy common land, over hill and valley, lies my way, the moisture dripping from the branches overhead as the sun gains power. A light breeze is clearing away the morning mist, and a few derelict leaves left over on the trees are flickering to the ground, nipped from their fragile hold by the night frost.

Over a springy carpet of pine-needles I make my way through the plantation that crowns the last hill, catching fitful glimpses of silver through the trees in the valley beyond. The trees give place to a slope of wild moorland, dotted with clumps of dull-green gorse from which the glory has departed. A solitary gipsy van is encamped on the waste land, a dusky houri in picturesque deshabille performing a primitive morning toilet on the steps, while her furtive-eyed lord and master slinks among the trees on some mystic quest, probably in connection with the commissariat department.

At the foot of the slope lies the weed-fringed lake; the myriad spears of bulrush and reed, now faded and brittle, that pierce the water of the shallow margin, guarding the homes of the wild duck and moorhens that circle and dive far out on the glittering surface, provide a lurking-place for the fierce and watchful pike that roam the depths in search of prey.

A small hotel nestles among the trees on the far side of the lake, and a few boats are drawn up alongside a miniature landing-stage. There is only one boat on the water, moored in a weedy bay, the occupants patiently fishing with float and live-bait for a legendary thirty-pound pike that is said to haunt that spot, to which is credited every accident that happens to an angler's tackle. The lost fish is ever the largest.

The pike are moving this morning. While waiting for my boat, I see here and there a spray of small fry leaping from the water before the onrush of the savage cannibals, a good augury for the day's sport. Soon my boat is launched, and I paddle gently out into the middle of the lake and let the boat drift slowly with the wind. A silvery sprat is my choice of lure, and with a steady swing it is sent flying through the air, plopping into the water thirty yards from the boat. Reeling in, the line checks, I strike sharply, and the bait flies out of the water. to fall into the boat with streamers of weed attached to every hook. Peering down through the clear water, I see a dense thicket of weed covering the bed of the lake, growing to within about two feet of the surface. The water is shallow here, so I move the boat slowly across the wind, looking for a more favourable spot.

The same conditions prevail, however, over the whole extent of the water, save for a deep channel a few feet wide in the centre. The only thing to do is to use a lighter lead and spin over the top of the weed. The change is soon made, and at the next cast the bait comes sparkling and glittering through the water, as I reel in, in a most attractive manner, about a foot below the surface. I have not long to wait for results. At about the sixth cast, while the boat is nearing a bank of rushes, the bait as it comes in seems to swerve violently aside and disappear, the line checks heavily, and on striking there is a flash of silver under water as the fish turns, and the line goes squealing off the reel as the pike makes for his lair in the weeds. tackle is strong, and the fish is soon in the boat, a thick-backed little jack about three pounds in weight. He is lightly hooked, and as I am looking for larger fish in this water, he is returned to fight again another day. Rowing back to the starting-point, I begin a fresh drift. the next cast there is another feeble run, and, twisting and turning, a tiny three-quarter pound jack is dragged unceremoniously over the side, released, and sent splashing back into the water.

Then follows an extraordinary hour. All the infants of the lake seem to be feeding at once. There is a run about every third cast, and fish after fish is lifted into the boat only to be returned, not one exceeding a pound and a half in weight! Baits are running low, and torn and mangled specimens that would in the ordinary course be discarded are patched up and made to serve again. This continues until my arm aches with casting, and only one or two sprats remain.

Better things are in store, however. At last, as my bait comes wobbling along near the surface, having been chewed and bitten out of all

shape, there is a swirl and plunge, and a fish distinctly not in the kindergarten class goes ripping through the water in grand style. Following on the babies, this feels like a monster; and when, after a few vivid minutes, he comes in sight I estimate his weight at ten pounds. Later, when he is safely landed, I revise my estimate to seven pounds. Alas! my judgment is at fault; the spring-balance registers five pounds only. However, by comparison, he is a good fish; and, well content, I pull to the landing-stage and adjourn for lunch. The live-bait fishermen come ashore at the same time, and we compare notes. They have had a far more tranquil morning than myself, with only two runs, but they have a sevenpound fish to show as the result.

After lunch I change my tactics. Instead of allowing the boat to drift at random, I anchor about forty yards out from a long bank of reeds, fishing the water well all round, then moving on a hundred yards or so and repeating the performance. The last sprat accounts for a fourpound fish. Natural bait being exhausted, I put on a Colorado spoon, a brilliant metal object of scarlet and silver with a tassel of red wool attached to it, as unlike a fish as anything could well be. It finds favour in the sight of the infants, however. Possibly they take it for a new toy, or something upon which to cut their teeth!

It serves that purpose admirably.

Toward evening, as the light begins to fade, larger fish are moving, two more sizable fish, of four and five pounds each, being added to the bag; and at last I get sight of the leviathan of the lake. A small fish of about a pound has taken the spoon, and is being reeled in to be given his release. When he is within a few yards of the boat a monstrous gray shape dashes out of the weeds, and a huge pair of jaws close like a steel trap on the unfortunate fish. rod is nearly torn from my hands. So startling is the event that I lose my head and hang on for all I am worth, instead of letting him have his own way. After one mad rush the line slackens, and I reel in. The small fish is still on, but is in a parlous state; so I give him the coup de grâce. My further efforts to convince the monster that silver and red wool are edible are of no avail, so I pack up and pull for the shore, taking with me undeniable evidence that the big fish is no myth, and being determined, now that I have discovered his lair, to try conclusions with him another day.

The air turns chill and damp as the daylight fades. The steady breeze dies away, and the reflections of the trees and rushes round the margin of the water grow sharp and clear save where the last faint breath of the dying day mars the glassy surface. Wisps of vapour drift over the water, merging slowly into a thick white blanket in sheltered bays, and the stillness of the coming night settles down over the countryside as, heavy

laden, I take the homeward road.

THE FIRST NOYADE AT NANTES.

AN EPISODE OF THE REIGN OF TERROR.

By GEORGE PIGNATORRE, B.C.L.

WITH despotic governments, drowning has always been a convenient mode of disposing expeditiously and secretly of criminals or obnoxious individuals. From the days of the gloomy and grim oligarchy of Venice, which condemned men to drowning in the Ornano Canal, into which they were thrown at dead of night, when a splash in the sullen, dark water was sometimes heard by a passing gondolier, who only crossed himself piously—that is, from the times of the Serenissima or Most Serene Republic of Venice down to later days in modern Turkey, and in Egypt before the British occupation—scores of men bound or tied in sacks were drowned in the Bosporus or off the Libyan coast, whether guilty or innocent. But the noyades of Nantes perpetrated during the Reign of Terror exceeded all these in atrocity.

The deeds of tyranny inaugurated by the accession of the Jacobins to power were perhaps the most wanton and ferocious the world has ever known. Those who were drowned in the Seine, in the Ornano Canal, in the Bosporus, or off the Egyptian shores were criminals in the eyes of the law, and suffered the legal penalty comminated in the arbitrary decrees sanctioned by despotic rulers, and generally accepted by the people as emanating from the royal prerogative of sovereigns reigning by right divine or in virtue of the power vested in them by the people themselves, or by a dictator or a supreme ruling body; but the populace never regarded as legitimate the wholesale noyades of men, women, and children flung into the Loire daily by the orders of the representatives of Liberty, Equality, and Fraternity.

In 1793, that year of blood and woe, tyranny weighed heavily on France, crushing the people into an equality of misery and squalor. The emissaries of the Government went east and west, north and south, on their cruel mission. Of all the evil men the times brought forth, no one save Le Bon at Arras equalled in ferocity the man sent by the Convention in the fall of the year to Nantes to purge that city and Brittany itself of traitors—otherwise, to put to death indiscriminately all those who were, in the opinion of the proconsul, lukewarm republicans.

Carrier inaugurated his barbarous career in November 1793 by the *noyade* of some ninety priests, mostly old and infirm, who had endured the hardships of confinement, intensified by insufficient food and maltreatment, for nearly two years. On the 28th of October the prisoners were transferred on board a galliot moored in the river, and packed in a confined space like the living cargoes of slave-ships. Then on the 18th of November they were aroused late at night,

taken on deck, stripped of the few valuables they still possessed, and told they were to be conveyed down the river on a lighter to the castle. They were then bound in couples and hoisted over the side into a kind of decked barge whose garboardstrakes had been perforated; then the moorings were cut, and the sinking barge, a veritable hearse of living men, drifted slowly down the stream on the ebb tide amidst the jeers of the executioners.

The water soon rose in the vessel, and the helpless victims, mostly very old men, some with crippled limbs, seeing their end was at hand, solemnly shrove and blessed one another. One man, the Abbé Landeau, who was in the prime of life, made an effort to save himself and the old monk to whom he had been tied. Through the tangle of half-floating bodies in the swaying and now waterlogged craft he dragged himself and his companion to an open hatchway and plunged into the river. Here he saw what nearly made him despair. The murderers were closing up in the wake of the scuttled barge, which was now settling down, the object of the miscreants being to finish any of their victims who might be left floating on the water. But the abbé was a strong swimmer; and, striking out vigorously into midstream, encumbered as he was with the deadweight of his feeble companion, whom he would not abandon, he succeeded in eluding the watchful eyes of the assassins, who, coming up as the barge sank, despatched the few who had been able to free themselves from their cords, braining them with oars or holding them under water with boat-hooks. Then, the gruesome work accomplished, Carrier's gang rowed back to Nantes.

Landeau—swimming on less swiftly now, for his strength was failing under the burden he was supporting—sought eagerly for a sandbank or an osier-clump as a place of rest or concealment, for he dared not land on either side of the river; but he sought in vain. His strength was nearly spent; he was loath to forsake the old monk whom he had rescued, and both would assuredly have perished had not the old man loosened his hold voluntarily and vanished into the dark waters. Landeau, lightened of his burden, rested on his back, and then swam on again, till, sighting a fishing-smack, he hailed it, and was hauled on board after some demur, for two of the fishermen would fain have left the calotin or shaveling to his fate. But the charity of the fishermen went no farther. Even the man who had befriended the abbé and induced his mates to consent to take him out of the water durst do no more; they were not utterly callous, but were afraid of Carrier. Therefore the abbé was put ashore, half-clad and chilled to the bone, and told to shift for himself.

Luckily the spot where Landeau had been landed was in close proximity to a hamlet, whose lights he sighted in the gloom; otherwise, hungry and half-frozen as he was after his long immersion, and exposed to the bitter November night, he would hardly have survived till morning. his desperate plight he resolved to chance detection and ask for shelter and food. The first cottage at which he knocked was inhabited by red-hot patriots, and remained closed; but the occupants of the second were loyal, honest Bretons, who welcomed him kindly, gave him food, a warm corner by the ingle, and a peasant's suit of clothes. Then they be sought him to depart, both for his own sake and theirs. Though they had heard of the man-hunt after recusant priests, they knew nothing yet of the final catastrophe; but they were aware of the grave danger they incurred in harbouring a proscribed man, for if they were discovered or denounced by the Bleu or republicans their lives would be forfeited.

The Abbé Landeau, refreshed and comforted, then bade his hosts farewell; and, disguised in the broad-brimmed hat and vest of a Breton countryman, with a pannier of vegetables, which gave him the appearance of a market-gardener, he made his way back to Nantes, which he reached safely, and where he lay in hiding until he was able to communicate with his brother, a substantial farmer near Guerande. The brother, on receipt of the abbé's letter, journeyed down to Nantes, bringing with him a change of linen, some money, and, what was more important, a stock of resourcefulness and courage which stood them both in good stead when they were making their escape; for the Abbé Landeau was so utterly unnerved that he was incapable of giving an intelligible reply to the few formal questions put by the guard at the city gate, and his evident terror must have aroused suspicion but for his brother's self-possession and ready wit in putting the guard off the scent.

The abbé abode in Guerande for some years, practising in secret his sacred office among the faithful, and shielded from harm by the sympathy of the people who had remained fervent Catholics and loyalists, in spite of the revolutionary emissaries. These people received with gratitude the ministry of the few devoted men who, like Landeau, preferred duty to safety, and at the risk of their lives christened the children, blessed the unions, and shrove the dying. Here the abbé hid by day in some secure retreat, or, when the hunt was keener than usual, in the fens of Brieux, where the soldiers or National Guards did not venture because of the treacherous quaking bogs, which could only be crossed in safety by the native fenmen. But the abbé, in spite of his precautions, had one very narrow escape. When he was about to don his surplice and officiate before a small congregation who met in secret in the house of a known royalist, a loud knocking was heard at the outer door, followed by the summons to open in the name of the republic! The chalice, monstrance-dish, and other sacred vessels were hastily concealed, and Landeau took refuge in a loft, where he lay ensconced under the hay. When the patrol of the National Guard burst in, demanding the instant surrender of the abbé, who was known to be concealed in the house, the inmates denied all knowledge of him; but the soldiers searched the building from attic to basement, prodding everywhere with their bayonets, the points grazing the fugitive in his hiding-place. Unobserved by his comrades, a friendly National Guardsman saved the occupants by concealing a chalice which had been imprudently left on a dresser, and later protected Landeau by standing over him in the loft, thus screening him from view.

The Reign of Terror, as is well known, came to an end in July 1794. On the 10th of Thermidor of the second year of the 'Republic One and indivisible,' Robespierre and twenty-two terrorists were guillotined. But the proscription of the priests was not abrogated until the advent of Bonaparte to the supreme power in 1800; so that, although no longer hunted down by the emissaries of the proconsuls, they were beyond the pale of the law, and if apprehended were liable to incarceration or transportation to the penal settlement of Cayenne.

Landeau did not live to see the repeal of the penal laws and the restoration of altars in France by the First Consul. Worn out by privations and anxieties, and weakened by exposure, he passed away on the 24th of June 1799, assisted in his last moments by his faithful vicar, Goujon, and was interred in his own parish church of St Lyphard.

WISHES.

I WISH I were the vagrant winds— The winds you hold so dear— That I might play sweet melodies For only you to hear.

I'd ring great music through the woods, My instruments the trees; I'd draw from out the quivering corn The tend'rest harmonies.

I wish I were the winds you love, That you might come to me In every mood, and ever find Unfailing sympathy.

I wish I were the great white winds, That in my spirit strong I'd wrap you round, and give to you A strength to meet all wrong.

I wish I were the winds of heaven,
That I might ever teach
In their vast tongue my love to you
Which dies in human speech.
MADGE M. ELDER.

'U G G I N S.

By Roy VICKERS.

IN THREE CHAPTERS. -CHAPTER I.

THE night was comparatively young—it was barely eleven o'clock—when Adolphus P. Vanner returned abruptly to the house in Park Lane which he had rented for the season. course, ordinary young men, even if they happen to be American millionaires like Adolphus, do not as a rule take houses in Park Lane. then, as this story may perhaps indicate, Adol-

phus was not an ordinary young man.

He strolled into the morning-room, pressed the bell-push three times, and waited somewhat

nervously until his valet appeared.

'Weston, I am going out again presently, and shall probably bring an uncle of mine home. Lay a cold supper for us, and see that a bed is ready for him.

'Yes, sir.'

'None of you need wait up.'

'Thank you, sir.'

After a proper pause for further instructions, the valet was about to retire. In fact, his hand was on the door-knob when he was abruptly recalled.

'Oh, and, Weston'-

'Yes, sir?

'My uncle belongs to an—er—elder branch of my family. He remained in England when my father migrated to America, with the result that he has not-er-enjoyed the same advantages as myself in the matter of-er-education and so forth. But I shall expect you, and the other servants, to treat him with the same respect that you accord to myself. Understand that clearly, please.'

'I quite understand. Good-night, sir.' Good-night, Weston.'

'Phew! I got through that rather well,' muttered Adolphus to himself as the door closed behind the valet. 'Only thought of the "elder branch" patter on the spur of the moment, too!' Millionaires, no less than field-marshals, are secretly afraid of their valets.

A few minutes later he went upstairs to his dressing-room. Having carefully locked the door, he changed his evening-dress for a lounge suit. After a prolonged search he found a favourite old overcoat which he had used on sundry fishing expeditions, and put it on. He surveyed himself

with dissatisfaction in the looking-glass.

'No earthly!' he exclaimed. 'Much too smart!'

Then his hand found an old deerstalker in the pocket of the overcoat. 'The very thing!

He put the cap on his head, and positively lowered the flaps and buttoned them over his ears. Then he crept furtively down the broad staircase, and so out into Park Lane itself.

'Drop me outside the Army and Navy Stores,'

he said to a startled taxi-driver.

From the stores he walked rapidly to the Embankment, where he skilfully changed his walk into a slouch. The slouch, plus the deerstalker, enabled him to pass a policeman without the latter evincing the slightest interest.

For upwards of half-an-hour he endured the bitter wind and intermittent sleet of a typical At the end of that time the winter night. cold had penetrated his overcoat, and made him anxious to end his mission. At length he thought he saw what he wanted, sitting alone on a bench

a stone's-throw from the Obelisk.

He seated himself gingerly at the opposite end of the bench, and studied his companion with approval. From as much of the face as he could see under the double disadvantage of a flickering arc lamp and a fortnight's stubble, Adolphus concluded that the fellow was middle-aged. There was no doubt about the holes in his boots, the layers of dirty newspaper which bulged from the top of his sodden, unpatched jacket, the string which peeped from the middle of his person.

'Up against it, pard?' tried Adolphus encouragingly. The accent was a passable imitation of cockney, though the phraseology was alien.

The man grunted unsociably. Dreading lest he should move off, Adolphus decided to bring matters abruptly to a head.

'Say, I reckon you are open to consider a job that begins with a square meal and a good bed?'

'Nottarf, I ain't,' jerked the other with the nearest approach to alacrity of which he was

Adolphus wrestled with the double negative. He was still undecided whether it was an acceptance or a refusal, when the other settled the matter by adding disgustedly, 'I thort you wasn't kiddin' at first.'

[All Rights Reserved.]

MARCH 21, 1914.

'I'm not,' replied Adolphus, rising. 'Come

on if you are coming.'

Too wretched to be capable of wonder, the outcast arose with difficulty and shambled after Adolphus. In obedience to the latter's command he crawled into a taxi, whither Adolphus followed him.

For a few minutes neither of them spoke. Then the man said, 'Yo're a Yank, ain't cher?'

'I'm a Yank,' replied Adolphus, deciding that the time had come to drop his abortive attempt at cockney. 'My name is Adolphus P. Vanner. Will you oblige by giving yours?'

Will you oblige by giving yours?'

The other hesitated. ''Uggins will do to go on wi',' he answered sulkily. 'Look 'ere,

guv'nor, wot's the gime?'

'My dear 'Uggins,' replied Adolphus, 'it would be better for both of us if I were to tell you the game after you 've had that meal.'

'I b'lieve I'm dreamin',' muttered 'Uggins, and meant it. He was destined to repeat the phrase many times before he went to bed that night.

The taxi brought them to the house in Park Lane. Adolphus mounted the steps, beckened to 'Uggins, and produced his latch-key.

''Ere, look 'ere'----

'A meal, 'Uggins—as much as you can eat—a roaring fire, and—a nice, warm bed.'

Thus was the protest effectively silenced.

Adolphus led his guest into the dining-room. As he turned on all the lights at once, revealing the somewhat magnificent interior, 'Uggins hung back nervously.

'Yo're sure it's orl right, guv'nor? I ain't out to be jugged, y' know,' he whispered. The next

instant he fell back in sheer terror.

Adolphus, perceiving the suspicion that was in the other's mind, had thrown back his head, expanded his chest, and emitted a remarkably good cat-call, the kind that was invented in Oxford and transported to Harvard on the latter's foundation.

'I am sorry to startle you, 'Uggins,' said Adolphus apologetically. 'I am not a maniac—honestly. Only I had to convince you that this really is my house. And now, see if you can get outside that cold fowl.'

Adolphus poured out a small lager, hesitated a moment, and then seated himself beside his guest. Noticing the latter's praiseworthy efforts with a knife and fork upon the anatomy of the fowl, he took his own drum-stick in his hands.

'Awkward things fowls,' he said. 'I always

eat mine like this.

'Uggins gratefully followed suit. But even this homely little touch on the part of Adolphus failed to relieve wholly his guest's manifest embarrassment. Adolphus at length thawed the ice by means of champagne.

It was while Adolphus was busy at the sideboard that 'Uggins moved the uneaten portion of the second fowl from the table to his pocket. Observe that it was the comparatively valueless and very cumbersome fowl that he purloined, and not the portable and obviously silver spoons that lay within easy reach.

The champagne did its work. There was not enough to make him fuddled; but there was quite enough to make him sociable. And when he had eaten his fill, lighted a cigar, and seated himself in an arm-chair before the fire, Adolphus found it an easy matter to draw his history from him, which, briefly summarised, was as follows:

The man who had chosen to call himself 'Uggins had not always been a wastrel. He had once been the proprietor of a fried-fish shop, but had come to undeserved disaster. Adolphus gathered that there was no more promising trade on earth than that of fried fish; its possibilities were enormous, provided that you had enough put by to tide you over a hot summer. But you blamed well had to have that little bit put by, or else—

'So I gather that the dream of your life, 'Uggins, is to re-establish yourself "in the fried

fish," as you put it?'

'No sich luck!' grunted 'Uggins mournfully.
''Uggins, you are wrong. Now listen! If
you will do something for me I'll tell you what
I'll do for you. I'll establish you in a fried-fish
shop; you shall have the best fittings procurable,
and a ton of fish to start with. More, I will pay
the rent for the first three years—three years,
'Uggins!'

'Uggins blinked. 'Look 'ere, guv'nor,' he said, with an intense solemnity, 'I'm—yore—

man-for anythink bar murder.'

'My dear 'Uggins, you surely cannot suppose'——

'Out with it, guv'nor,' interrupted 'Uggins, almost fiercely. 'It's torcher—waitin'.'

'Right! I shall require you to live with me for three months—as my uncle. During that time you will have all the comforts and luxuries which I myself enjoy; your slightest whim will be gratified. Only—you will touch no coin. And if you throw up your job before the three months have expired, you will get no fish-shop; you will receive nothing, in fact. Is it a deal?'

'But wot's the gime, guv'nor?'

'I am not going to tell you the game, 'Uggins. You've heard my proposition. Take it or leave it!'

'Tike it, guv'nor; tike it. Only it—it seems almost ridiclus.'

'It is ridiculous, 'Uggins. You will probably make a most outrageous fool of yourself. But you don't suppose you are going to get that beautiful fish-shop for nothing, do you? Now,' Adolphus continued, 'you are my uncle Peter. The first thing you want is a bath. Come along upstairs. I can lend you some pyjamas and a lounge suit for the morning. It will do until the tailor can fix you up. And look here, Uncle Peter, you put your own clothes in this dressing-

case—every stitch of them. It's an old case, and I will contrive to lose it to-morrow.'

In due course the erstwhile outcast, now garbed incongruously in a suit of pink silk pyjamas, followed his self-adopted nephew into the bedroom.

'This is your room, Uncle Peter,' said Adolphus hospitably. 'My valet will wait upon you in the morning.'

'Ere, guv'nor, I don't want no bloomin'

varlet!

''Uggins,' replied Adolphus with acerbity, 'understand, once for all, that you must not interfere in the slightest degree with any arrangements I may make for your comfort. Goodnight, Uncle Peter,' he added, with his former friendliness.

'Goo'-night, guv'nor!'

'You mustn't call me "guv'nor." I am your nephew. You must call me Dolly.'

'Goo'-night-Dawly!'

'Fency callin' a man Dawly!' muttered 'Uggins as he was left to himself. He sniggered. 'Jest like a bloomin' gell!' He laughed, laughed uproariously, until the tears came to his eyes. In his overwrought state the one thought that stood clear in his mind was the outrageous absurdity of calling a man Dawly. He gazed at the glistening sheets on the bed with sudden sobriety.

'I b'lieve I'm dreamin'!' he exclaimed. Then he crawled reverently into bed. He omitted to

switch off the electric light.

CHAPTER II.

THE first morning seemed remarkably like heaven to 'Uggins. That is not to say that he was completely happy. But then he had always had a shrewd suspicion that he would not be completely happy in heaven. He now experienced all the wonder, the sense of tremendous self-importance, tempered with a strong secret embarrassment, which he had from childhood associated with the blessed state.

After breakfast Adolphus took him to his own tailor. When that august personage addressed him, 'Uggins struggled manfully to avoid the use of the word 'sir,' and succeeded almost every time, although his sentences had a trick of ending with a mystifying hiss.

Then followed the wonderful visit to Moun-

tage's.

After a few minutes' conversation with the manager, Adolphus handed 'Uggins to the charge of an ambassadorial person in a frock-coat.

'Order anything you can see, uncle,' said Adolphus, with deliberate ostentation. 'Bring him back to me in the smoking-room when you have finished,' he added to the salesman.

It is by means of trifles that the imagination can grasp greatness, and Adolphus knew it. If he had given his temporary uncle a catalogue of his own stocks and shares, and told him that for three months he could live at the rate of so many tens of thousands a year, 'Uggins would have exclaimed much and understood little. But now he would understand everything.

The hosiery department was the first visited. Here 'Uggins left matters largely to the salesman, although he wanted to protest that he would feel a fool in the various soft-spun fabrics

that were to form his underclothing.

As they progressed through the huge store 'Uggins was amazed at the number and variety of articles which the salesman discovered him to be in need of. The sense of unreality was strong upon him. But as the list of purchases grew he began to feel afraid. He wanted to tell the salesman to stop, but he dared not. As a fact, the conviction was rapidly growing upon him that the salesman was mad, putting things down like that as soon as wink at a fellow.

On the threshold of the jewellery department

he gathered strength for a protest.

'And of course, sir, you will need a watch,' said the salesman in the most natural manner possible. A moment later he was explaining the mechanism of a gold repeater.

'Ain't much good, strikin' in me pawket,' sug-

gested 'Uggins.

'My dear sir, that is not its purpose. Suppose,' said the salesman impressively—'suppose you should desire to know the time in the

night?

Uggins had never supposed himself desiring to know the time in the night, but (such is the power of scientific salesmanship) he was now prepared to believe that a number of unpleasant things might possibly result from his ignorance of time in the night. And so the repeater was duly booked.

'And now we come to sleeve-links. Diamonds,

perhaps'----

'I never use 'em,' tried 'Uggins desperately.

'Never use them?' echoed the salesman. 'Then, my dear sir, how do you manage to secure your cuffs?'

It was this sort of question that made interference so dangerous. When 'Uggins caught sight of the sleeve-links, tactlessly ticketed at ten guineas, he resolved upon desperate measures. While the salesman's back was momentarily turned, he slipped from the department and literally bolted to the smoking-room.

'Ere, guv'—Dawly, we got ter get out o' this, quick! E'll catch us in 'arf a mo'!'

'What the '---

'It ain't my fault—reely it ain't. 'E kep' writin' them things in 'is book afore I could stop 'im. Gold watches an' sich like! It 'll run yer into 'undreds! Oh lor, 'ere 'e is!'

It was lunch-time before Adolphus could convince him that the whole thing was neither a

joke nor a nightmare.

After lunch another disconcerting experience

awaited 'Uggins. Without ceremony the door of the smoking-room where they were sitting was flung open, and a couple of young men burst in.

'Cheero, Dolly!' cried one of them.

'Hullo, you fellows! Let me introduce my uncle Peter. Uncle Peter-Lord Riverstone-Mr Torrence—Uncle Peter.'

While Torrence was shaking hands with 'Uggins, the latter thought he heard Lord Riverstone say in an undertone, 'Dolly, you don't

mean to say you have '——
'I have,' replied Adolphus. 'And it's going to cost you five hundred, my boy. See if it doesn't!'

His first encounter with Adolphus's friends was not quite such an ordeal as 'Uggins had expected it to be, though he did not realise this until it was over. As a fact, he stood in less awe of Lord Riverstone, title notwithstanding, than of the valet Weston, whom he feared and hated.

Owing to the fact that his dress-clothes were not yet ready, he had to spend the next three evenings alone in the house. In those evenings he suffered agonies of boredom. There was nothing whatever for him to do. Even the flavour of Adolphus's cigars began to pall.

To such a state of longing for human companionship was he reduced upon the third night that he actually decided to make overtures to his

enemy, Weston.

He came to the decision at ten o'clock. At a quarter to eleven he was still hovering around the bell-push. Then he pressed it. With a the bell-push. Then he pressed it. sudden inspiration he made a dive at the bookcase, and laid a weighty volume on his knee. Thus equipped, he waited with a thumping heart for the door to open.

'I—I should fency a drink, please,' he said

apologetically as the man appeared

'Yes, sir,' said Weston, as he solemnly removed the tray containing whisky, a siphon, and tumblers from the sideboard, where it had stood ready to hand, to the table.

'Uggins was no fool, and he perceived at once

his stupid blunder.

"Ave a drink yourself," he tried, struggling to control his voice.

'Thank you, sir, but I never touch spirits,' said Weston.

Then sit down an' 'ave a cigaw,' cried 'Uggins desperately.

Thank you, sir, but I would not so pre-

sume.'

And as 'Uggins mentally staggered under the weight of the blow, Weston added, 'Is there anything further that you require, sir?'

'No, thenks!'

'Blawsted 'og!' muttered 'Uggins bitterly as 'Ain't got a word to say for he was left alone. 'isself! Blawsted 'og!'

He glanced idly at the book on his knee. He read the title, *Principles of Social Philosophy*, and shuddered. He was about to put it away, when his eye fell upon a marked passage.

'The proletariat,' he read listlessly, 'continue to cry enviously for the luxuries of the rich, ignorant that those very luxuries require an education for their proper enjoyment. It may be confidently prophesied that a typical proletarian, suddenly compelled to live the life of a gentleman of affluence, would in a few short weeks demand reinstatement in his former environment, notwithstanding its undoubted hardships.'

'Wonder wot all thet means,' mused 'Uggins

without interest.

In the margin he saw in pencil, '£500, Riverstone,' followed by a date.

(Continued on page 266.)

THE DIFFICULTIES OF INVESTING IN GOVERNMENT STOCKS.

By HERBERT H. BASSETT.

SOME time ago I wrote in this Journal an article showing how the British Government discouraged thrift by penalising the post-office depositor who transferred his savings to Consols. An instance has since come under my attention of another hardship which attends the investment of capital by the small investor in our premier security. R. X., an artisan living at Nottingham, desired to purchase a house for his aged grandmother; and as the date for the completion of the purchase did not fall due, owing to special circumstances into which I need not enter, until a period of two months had elapsed, he purchased Consols in his grandmother's name. Consols were, in his opinion, the safest place for the

principal until he required the money. The Consols, to the amount of £250 nominal, were purchased at a cost of 74 per cent., or £185, 5s., plus the broker's fees. This was early in June. Toward the end of July it became necessary to sell the Consols, as the money was required to complete the purchase of the house. The Consols were sold, and realised $72\frac{1}{4}$, or £180, 12s. 6d., less the broker's fees. It was then found that the grandmother of R. X. must attend personally at the Bank of England, and be identified by the broker as the person holding the Consols, or must give a power of attorney to the broker. As the old lady was practically bedridden, a journey to London was out of the

question; and, had it been feasible, the railway fare would have been very expensive. A power of attorney, which cost 10s. for stamp-duty, was therefore signed, and ultimately the Consols were reconverted into cash for the purchase of the house. Meanwhile the original sum of £185, 5s. had dwindled to £179, 17s. 6d., thus:

Original purchase price of Consols	£185 0	0 5	0
	£185	5	0
Sale price of Consols	£180	12	6
	0	16	6
Net loss	£179 5	16 9	
	£185	5	0

No interest was received during the period the Consols were held, because, although the quarterly dividend was payable on 1st July, the books are closed on 1st June, and the Consols were sold ex the dividend after that date. The loss was, therefore, if we add the rate of interest at $2\frac{1}{2}$ per cent. per annum for the period of two months, nearly £7. The gravity of a loss of £7 to an artisan is best expressed by saying that it represents the saving of nearly 3s. a week for a whole year out of a weekly wage of 37s. 6d., and is economically as grave a loss to him as would be £100 to a manager earning £20 per week.

The foregoing does not comprise all the difficulties which operate against freedom of investment in Consols. The signature to the power of attorney requires to be attested by two witnesses, who, if they are servants or clerks, must give the names and addresses of their employers. In the majority of instances this does not create much difficulty, but it is conceivable that many persons would be rightly annoyed at having to go in search of two witnesses. Transactions involving the transfer of thousands of pounds of securities take place every day on the signature of the seller witnessed by one other person, and it is difficult to understand the reason that an exception should be made in the case of a Government stock.

The filling up of that part of the power of attorney which gives the name and address of the seller is also often a source of endless trouble. A buyer of Consols in, say, 1883, who has instructed his broker to sell, is required to repeat the identical words in which he was originally described in the Bank of England books, without any assistance on the Bank's part. How many persons in a hundred are capable of stating exactly how they described themselves in a document in 1883? Harry Thomas Brown, Mayview, Charles Street, Berryash, Gentleman, is not, in the eyes of the transfer department the same person as Harry Thomas Brown, 51 Charles Street, Berryash, Esquire. The application will

be returned, but the broker will receive no assistance as to where or how the description is inaccurate, and poor Mr Brown will have to cudgel his memory as to where he lived thirty years ago, and how he described his then place of abode and his occupation or position in life in the particular document in which he authorised his stock to be inscribed in the Bank's books.

It may be suggested that the possibility of an unscrupulous person imposing on the credulous makes it very necessary to put every difficulty in the way of easy realisation; but if it is necessary to hedge the transfer of Government stock with so many difficulties, logically it should be necessary in the case of the stock and shares of every other corporate undertaking. As it is, we find the shares and stocks of thousands of companies are transferable on the lodgment of a signed and attested transfer, and the number of instances where forgery or fraud takes place is infinitesimal in proportion to the great number which daily pass through the Stock Exchanges of the country.

The cumbrous transfer system is already being overhauled by the railway companies, who have even gone to the expense of obtaining parliamentary powers to issue bearer bonds so as to Without entering here facilitate investment. into the advantages or disadvantages of bearer bonds, it may be said that the experience of those who have to deal with Stock Exchange matters is that bearer bonds are becoming increasingly popular among the public, who prefer them to inscribed bonds. It is the general feeling that not until the Government also overhauls its regulations concerning the purchase and sale of its stocks will they appeal to the large mass of the investing public who do not wish to be worried with the trivialities, to say nothing of the expense, which attends the transfer of British Government stocks.

In France, Rente—the French form of Consols—can be bought and sold in small amounts at most money-changers', and it is a favourite form of investment even for the poorest peasant, because the capital is safe, and the income is certain. Is it not possible for the Treasury to deal with this matter, in conjunction with the Bank of England? It should not surpass the art of man to strip the buying and selling of Consols, and their transfer from one person to another, of all those departmental and legal regulations which now operate against their popularity, without unduly laying the way open to impersonation or fraud.

[The Editor having submitted a proof of this article to Mr Alexander Cargill, manager of Edinburgh Savings Bank, he pointed out that had 'the artisan living at Nottingham' bought his Consols through a savings bank he would have been saved not only trouble but cost.]

A KNIGHT ON WHEELS.

CHAPTER XIV .- continued.

V.

IT was nearly ten o'clock. Most of the boys were in their dormitories by this time, either in bed or cultivating the rites of Mr Sandow. Only the seniors lingered downstairs. Various young gentlemen who shortly meditated a descent upon one of the universities sat in their studies with curtains closely drawn, painfully translating a Greek not spoken in Greece into an English not spoken anywhere. The Quartette were all together in Philip's study, engaged in one of the commonest recreations of English gentlemen.

Presently Desborough uncoiled his long legs from under the table, and stretched himself.

'Fairly average frowst in here,' he observed.
'Anybody mind if I open the window?'

Silence gave consent. The curtains slid back, and some much-needed oxygen was admitted. A long ray of light shot out into the darkness of the night. It fell across the path of Mr Brett, returning from his bridge-party. The evening breezes played about his brow, but failed to cool it. He was in a towering rage. His management of his own House, his powers of selecting suitable lieutenants—these things had been called into question that night, called into question and condemned. And he had lost five-and-six-pence to Allnutt.

Suddenly his homeward way was illuminated by electric light. It came from the window of Philip Meldrum's study, which was situated upon the ground floor. Mr Brett paused, drew near, and surveyed the scene within. In the confined space of the study he beheld four boys sitting closely round a table.

A minute later he was fumbling for his latch-key at his own front-door. He was in a frenzy of excitement. He did not pause to reflect. Humour was not his strong point, or it might possibly have occurred to him that the present situation possessed a certain piquancy of its own. Had Mr Allnutt been present he would have made an apposite reference to the Old Obediah and the Young Obadiah. All that Mr Brett realised was the fact that Providence had most unexpectedly put into his hand the means of vindicating his own infallibility as a judge of boy character, and—of scoring off Allnutt for all time.

With eager steps he passed through his own quarters, and hurried down the long panelled corridor in which the boys' studies were situated. He opened Philip's door quickly, without knocking, and stood glaring balefully through his spectacles upon the culprits.

Their heads were sunk upon their chests, but not with shame. In fact, they entirely failed to observe Mr Brett's avenging presence.

The first person to speak was Philip, who was sitting with his back to the door. He threw his cards down upon the table and said cheerfully, 'Well done, partner! Three tricks, doubled—that's seventy-two. Game and rubber, and you owe me fourpence, young Laird of Cockpen! Now, what about bed?'

VI.

No one was expelled, though in the first frenzy of his triumph Mr Brett was for telephoning for four cabs on the spot.

The Head gave judgment in due course; and though he had no particular difficulty in dealing with the criminals, he experienced some trouble in handling the counsel for the prosecution.

To him the overheated Brett pointed out that the delinquents had been caught red-handed in the sin of betting and gambling. He explained that smoking, drinking, and cards invariably went together, and that consequently nothing remained but to request the respective parents and guardians of the Quartette to remove them with all possible despatch before they contaminated any of the Classics or cricketers in the House.

The Head heard him out, and remarked dryly, 'Mr Brett, you should cultivate a sense of proportion. It is a useful quality in a schoolmaster. Your scheme of retribution, if I may say so, is a little lacking in elasticity. There are degrees of crime, you know. Under your penal code the man who has been caught playing pitch-and-toss is hurried to the gallows with the same celerity as the man who has garrotted an archbishop. Don't you think that this scheme of yours of a uniform penalty for everything rather encourages the criminal to go the whole hog and have his money's worth? Now observe: the offence of these boys was a purely technical one. A game of cards between gentlemen for stakes which they can reasonably afford '—the Quartette played for twopence a hundred—'is not in itself an indictable offence. I only wish that boys would always employ all their spare time so profitably! added the Head regretfully. 'Personally, I should sincerely like to see every boy in this school grounded systematically in the elements of whist or bridge. It would improve his memory and inculcate habits of observation and deduction, and would at least furnish him with an alternative to the kinematograph on a wet afternoon in the Unfortunately we have the British holidays. parent to deal with. However, that is a digression. These boys are not of the stuff that debauchees are made of. The trouble lies in the fact that they are rather more mature than their

fellows. Do you know, I expect they play bridge because they like it, and find it a more pleasant relaxation at the end of the day than cooking unholy messes over their study fires or gossiping in the dormitory. I must also point out to you that by not appointing them to a position of authority you have thrown them more or less on their own resources. They may not associate with the aristocracy of the House, and they are more than a cut above the common herd. So they form themselves into a very snug and exclusive little coterie, and I for one don't blame them. But send them along to me, and I will deal faithfully with them.'

To the Quartette the Head pointed out that there is a time and place for everything, and that rules, if not enforced, bring mockery and

discredit upon their authors.

'Bridge is an excellent game,' he said, 'and a true mental gymnastic. But there happens to be a regulation here which forbids the playing of cards by boys among themselves. We need not go into the soundness of that regulation; the only relevant point is that you have broken it. You are big boys, and the bigger the boy the bigger the offence. I am going to make the punishment fit the crime by asking Mr Brett to turn you out of your studies for the rest of the term. For the next four weeks you will consort with the profanum vulgus in your House Common-room, where I fancy that bridge and other intellectual pursuits are not much cultivated. Now you can go.'

The Quartette turned dismally toward the door. It was a stiff sentence. But the Head

had not quite finished.

'It would be interesting,' he added dryly, 'to know whether you play bridge because you like it or because you think it a grand thing to do. Come and dine with me on Saturday night, and we will have a rubber.'

'Sportsman, the old Head!' commented Philip, as they walked across the quadrangle.

'My word, yes!' said the other three.

CHAPTER XV .- THE IRON AGE.

MR MABLETHORPE was much interested when Philip told him the story in the holidays.

'The Head is all right,' he said. 'He was only a Housemaster in my day, but there was no doubting his quality, even then. But this man Brett is a national disaster. Do you think you can derive any further profit from remaining his disciple?'

No, Philip thought not.

So Philip arrived at Coventry at last, having started some years previously, it may be remembered. He was enrolled as a premium apprentice at the great works of the Britannia Motor Company. Here he learned to use his

fingers and his fists, his muscles and his wits. He passed through the drawing-office, and the erecting-shop, and the repairing-shop. The last interested him most of all, for the Britannia Company repaired other cars besides their own; so here Philip could indulge in the pleasures of variety. He learned to handle cars of every grade and breed. There was the lordly Britannia car itself—the final word in automobilism—with its long gleaming body and six-cylinder engine, so silent and free from vibration that it was possible to balance a half-crown edgewise upon the faintly humming radiator. There were countless other makes—racing cars, runabout cars, commercial cars, even motor omnibuses. Philip learned to know the inner economy and peculiar ailments of all. There were American cars so cheap that you could not believe it possible that they could be sold at a profit to the maker until it became necessary to put in repairs or adjustments. Then the whole car seemed to fall to pieces like a house of cards. Exasperated mechanics in the Britannia repairing-shop had a saying that if you wanted to take up the engine-bearings in one of these cars, you had to begin by taking down the back axle. There was sufficient truth in this adage to set Philip wondering why such a nation of born engineers should make a point of placing their nuts and bolts in almost inaccessible positions.

'What is the reason of it all?' he inquired one day of a colleague from Pittsburg, who was assisting him to dismantle the greater part of the clutch and flywheel of a cheap American car as a preliminary to adjusting the magneto. 'Why do you make cars like jig-saw puzzles?'

The colleague explained. He was a pleasant youth of twenty, with the studiously courteous manners of the American gentleman—they contrasted quaintly with Philip's shy native brusquerie—sent by a big-headed father to acquire a little British ballast before assuming the position of second in command at home.

'I conclude it is because our national point of view is different from yours,' he said. 'These cars aren't meant to be repaired. We make it as difficult as possible to do so. You in this country like to build a car that will last, like Westminster Abbey. Over there we say, "What is the use of sinking good money in a design that will be out of date in two years anyway? Make it good if you can, but make it cheap, and when it wears out make another. And whatever you do, don't fool around tinkering. Life's too short." At least it is in our country,' he added, smiling. 'Over here you seem to make it go a bit farther, like your automobiles. Unscrew that nut some more.'

They were full and profitable years, those at the Britannia Works. As Philip gradually emancipated himself from the hard manual labour of the shops and rose from practical to theoretical problems, his old mathematical and scientific ability cropped out again. His inventive genius

began to stir. Petrol was going steadily up in price, so Philip set himself to experiment with substitutes. The result was the Meldrum paraffin carburettor, now a standard adjunct of the commercial motor. Later on came the Meldrum fool-proof automatic lubricator, which achieved high favour with absent-minded amateurs who made a hobby of allowing their engines to seize. And later, in fullness of time, came the Meldrum automatic electro-magnetic brake, which was destined to play a tremendous part in Philip's history, as you shall hear.

With all these burning interests to occupy him, Philip had little time for amusement. He played Rugby football regularly for Coventry City; and any one who has had experience of that gentle pastime as cultivated in the Midland counties will realise the testimonial to Philip's muscle and general fitness involved in his selection. Every Saturday he fared forth with his colleagues to do battle with the men of Moseley and Leicester, or even penetrated to London, there to indulge in feats of personal but friendly violence at the expense of Blackheath or the London Scottish. He particularly enjoyed the occasional visits of the team to Oxford and Cambridge, for there he usually encountered some old friend-Lemaire, now a scholar of Balliol, or Desborough, coaching a crew upon the tortuous Cam.

But Rugby football was no fetish with Philip, which would have pleased Mr Brett. heart was centred on his work. To Philip in those days Work was Life—a point of view which in due course Time would correct, or rather supplement. Each night when he said his prayers—he had contracted the habit at the age of sixteen, after a certain Sunday evening sermon from the Head, backed by a particular hymn, which had awakened in his rapidly developing little soul the knowledge that there were more things in heaven and earth than were included in Uncle Joseph's scheme of education —he asked his Maker, tout court, for work, and work, and more work, and health wherewith to perform it. Only that.

In addition to Collier the American, he made other friends about the works. Some were of humble station; others—like himself—premium apprentices who had paid to be taught their business, and hoped one day to direct businesses of their own, or at the worst lounge immaculately in a showroom in Bond Street or Pall Mall, intimidating wealthy but plebeian patrons into buying more expensive cars than had been their original intention. They were a rowdy, sociable, goodhearted crew, addicted to what they called 'jags' on Saturday nights. Then there were the salaried staff of the works. One Bilston, director of the drawing-office, conceived a strong liking for the capable Meldrum, and it was mainly through his representations that Philip, when he emerged from his apprenticeship and began to pass examinations, was kept on at the works and given

a post which combined increased responsibility with further opportunities to perfect himself in his craft.

Occasionally Philip took a holiday. Sometimes he went to Cheltenham, where Uncle Joseph, roaring like any sucking dove, was devoting his reclaimed existence to Territorial Associations and Boy Scouts. To be quite frank, Philip was secretly conscious of a feeling of slight boredom at Cheltenham. A perfectly happy couple are undeniably just a little dull, and Uncle Joseph and the Beautiful Lady were so entirely wrapped up in one another and their daughter—an infant of quite phenomenal wisdom and beauty—that the ordinary pleasures of life were not for them. They held, rightly, that pleasure is the resource of those who have failed to find happiness, and consequently had no need of it; but their nephew, who had not yet arrived at the period when a man begins to ask himself whether he is happy or not, and possessed a frank and healthy appetite for the usual diversions of a young man on holiday, found existence at Cheltenham a trifle too idyllic to be satisfying.

He enjoyed himself more at Red Gables. Mr Mablethorpe remained as incorrigibly Peter Pannish as ever. Although his hair was whitening and his figure becoming more spherical, he declined to grow up. His levity was a perpetual sorrow to his sensitive spouse. Once, in response to a more than usually tearful appeal, he made a resolute effort to reform. He read The Times at breakfast, supplements and all. He dressed himself in tight garments and accompanied his wife to tea-parties. He began to talk of engaging a chauffeur instead of indulging in personal bearfights with Boanerges. In short, he became so unspeakably dull that Mrs Mablethorpe grew more tearful than ever, and said it was breaking her spirit to have to keep on smiling and being cheerful for two. Whereupon Mr Mablethorpe, removing his tongue from his cheek, reverted to his former state, to the great comfort of Red Gables.

Of the Dumpling Philip did not see much. She was usually at school; but when they met during the holidays she always appeared to her former playmate to have lost yet more of her adiposity, and to have shot up another six inches. But they continued to be firm allies; and though in time the Dumpling grew reserved and gauche, after the manner of adolescent maidens, their old joyous camaraderie over such things as Boanerges and birds'-nests was never suffered to die out.

One other haunt of his youth Philip visited—the house on Hampstead Heath.

He went twice. The first visit was paid during one of his school holidays, a trial on a new bicycle affording a pretext. (Philip was too much of a schoolboy by this time to admit even to himself that he proposed to ride forty miles just to see a girl.) It was midsummer. He arrived on the Heath about two in the afternoon, and leaving

his bicycle leaning against the trysting-gate of happy memory, cruised methodically about, stealthily watching the house in the hope that a certain slim figure would emerge from the side-door and come skipping down the road. But no such thing happened. The only member of the household whom he encountered was Montagu Falconer himself. He swung suddenly out of a side-road, walking at his usual frantic pace, and, looking straight through Philip, whom he entirely failed to recognise, shot past him, and was gone. But nothing further happened, and our knight, after lingering until dusk, pedalled home unrewarded by a glimpse of his Lady.

The second visit was paid two years later. This time Philip arrived at Hampstead by tube, and walked boldly up to the Heath, big with resolution. He had decided to ring the bell like

a real afternoon caller, and inquire if Mrs Falconer were at home.

As he drew near the house his footsteps faltered. Young women may wonder why, but the young man who still remembers the agony of his first formal call will not. But Philip walked on resolutely.

Finally he arrived at the house of his Lady. It was shuttered and silent. The garden was weedy and the lawn unsheven. Beside the gate a staring board said:

TO LET.

(Continued on page 260.)

ANTARCTICA.

AMONG the outlying islands over which the Commonwealth of Australia exercises jurisdiction is Macquarie, a little speck in Antarctic waters, known to navigators for somewhat over a hundred years, but now occupying a prominent place in world affairs as the stable centre of the wireless system connecting Antarctica with civilisation.

The meteorology of the South Seas and as far up as the Indian Ocean is affected in important respects by the gales from the regions of perpetual ice. Australia, New Zealand, and many other large settled areas possess weather stations, and have hitherto considerably helped shippers by timely warnings; but their best efforts have fallen far short of what might be achieved were it possible to make known the movements of storm elements at or near their place of birth.

Macquarie Island, nearly one thousand miles south of Hobart, was a couple of years ago selected by Dr Mawson, the leader of the expedition to Adelie Land, as the site of a wireless station to which he could communicate intelligence from the mainland of the Antarctic continent, and from which that intelligence could be wired to the world. It was conjectured that it would be impossible to erect a machine on the bergs or rocks which would transmit a message to Australia, and Macquarie Island was thus relied on not only to keep the expedition in touch with the world, but to serve afterwards as the most valuable of the distributors of meteorological intelligence. As matters have turned out, the temporary wireless structure on Adelie Land has been surprisingly successful. Besides communicating fully with Macquarie Island, eight hundred miles off, the expedition has been able on favourable occasions to send messages direct to Sydney, two thousand miles away. When, however, the expedition has finished its work the island will be looked to as the basis from which to calculate most of the weather elements of the South Seas, and to obtain a better understanding of the circulation of the atmosphere

generally.

This little island - which 'wireless,' the youngest child of Fairy Science, has awakened to usefulness-has had, though for some years it was undisturbed by man, a past of boisterous human industry and passions. It is twenty-two miles long, is mountainous, and covered with a scrubby growth; and as it lies in the great fairway of the sailing circle between the Cape of Good Hope and South American ports, where the weather is often tempestuous, it is somewhat inexplicable that its discovery was not made until the year 1810. Portions of wrecks found here and there about the coast are taken by some to mean earlier visits, but the wreckage may have drifted or been blown ashore from a distance. At all events, Captain Hasselborough was the first to report the discovery and give a full description of the island and its surroundings. On 17th August 1810 he arrived in Sydney in command of the brig Perseverance, at that time owned by the Messrs Campbell, Australian merchants, and soon the then small town was in a ferment of excitement over the news he brought of waters alive with seals and seaelephants, and of an island suitable in every way for treating the skins and extracting the oil. So alluring were the reports that several merchants fitted up ships and sent them south to participate in the spoil, and these were quickly followed by vessels from New York and San Francisco.

The island was given the name of the then Governor of New South Wales, Lachlan Macquarie; and, despite the fact that sea and wind were often tempestuous, it was regarded as a

tolerably enjoyable spot by the adventurous gangs who settled there. On the flat top of the island were lagoons of fresh water, and an edible wild cabbage abounded, while penguins sat on Two reefs to the north, which every rock. they named Judge and Clerk, and two to the south, Bishop and Clerk, bounded their field There was, however, neither of operations. wood nor coal, so that these necessaries had to be imported from Australia. The men's huts were rude stone hovels covered with grass or matting, the chief consideration being the selection of a site as sheltered as possible. The custom was to land a gang, leave two months' supplies, then take the vessel back to port, and return at a stated time to receive the barrels of oil and bales of skins which had in the meantime been prepared. Gangs could take service for a fixed period, or-things being satisfactory on both sides—could stay on indefinitely; and some remained on the island continuously for over six years.

At the outset every party met with great suc-The first season yielded one hundred thousand sealskins, and all the barrels were filled with sea-elephant oil. The health of the men was good and their spirits high; but there seems to have been little thought of the morrow. Seals were killed indiscriminately; old and young, male and female, were shot or knocked on the head as occasion offered. The sea-elephants were similarly butchered, and even the penguins realised that their inoffensive presence invited death. Dogs brought by members of the gangs were left uncontrolled, and penguins' eggs were destroyed Birds of lighter wing that made wholesale. homes in holes of the rocks went elsewhere. In a few years the returns of oil and skins fell away, and in 1815 only between five thousand and six thousand seals were accounted for. Seals and sea-elephants were either reduced in numbers or went farther south for a resting-place. The gangs now became discontented, and many members left as soon as their boats could take them off. Merchants found the enterprise profitless, and, on the ground that the industry was worked out, withdrew their vessels from the trade or merely intermittently sent a boat to find if the men remaining behind had accumulated a stock worth carrying away. In good times men of different gangs were not friendly with each

other; their spheres of work were not definitely marked. It was, indeed, a case of each gang for itself. The bad blood became worse as times hardened; and, as the island was small, personal encounters were frequent. A few seals seen sunning themselves on the rocks or sea-elephants rolling in the surf roused the passion for possesssion, and the creatures often made their escape while their would-be captors fought among themselves. In 1820 a Russian expedition touched the island, and, while describing the seals, seaelephants, and penguins as numerous, found the inhabitants a wretched lot, living chiefly on the paws of sea-elephants, and clad in the skins of The captain's summary is that they looked seals. like fiends.

The hard times among the men were accompanied by unusual convulsions over which they had no control. Whirlwinds and blizzards were of daily occurrence. The Campbell-Macquarie, of two hundred and forty-eight tons, built in Calcutta, ran aground and went to pieces; and, though the crew reached shore, four Lascars and a white man succumbed. No less than twelve earthquakes occurred within a few hours, when rocks were thrown into the air and portions of ridges torn away.

Subsequently various attempts were made to revive the trade in seals and sea-elephants; but though temporarily promising, they failed to establish a regular business. A year ago the last effort in that direction was put forth; but boats and men have been withdrawn, and the project declared hopeless.

Such is the minute rocky speck from which the world is wirelessly fed with Antarctic news. The little company stationed there will, in addition to meteorological work, devote time to other scientific investigations which its unique opportunities offer. Members of the staff will deal with geology, ichthyology, and other branches of science, and their contributions should add materially to the sum of extant knowledge. island may also contain unknown minerals. Recently the wireless mast was smashed in a blizzard, and when it was re-erected it was found that the mineral used in the receiver had run low, and the receiver was practically useless. member of the staff set about fossicking over the island, and returned with a new mineral which gives excellent results.

A WEST AFRICAN STORY.

HE was new to West Africa, an English barrister put into the seats of the mighty abroad by those in the seats of the mightier at home, and it was his first experience as judge in a murder case. Evening had come on, and the candles had been lighted in the little wooden court-room. Above his head the punkah swung

lazily to and fro, driving a feeble current of hot, moist air on to the desk at which he sat. In the dock in front of him stood the prisoner, a nearly naked savage from the backwoods, serene, impassive, and quietly dignified. All around, squatting on their haunches on the bare wooden floor, sat groups of natives perfectly silent.

'You have heard the evidence against you. Have you anything to say?' the judge asked. The question was translated to the prisoner, who listened gravely.

'I slew the woman, as was right,' he answered; and then, pointing to a gray-haired Englishman in the well of the court, he added, 'The big police chief knows. Let him tell you.'

The judge paid no attention to the gesture. 'Have you anything to urge in extenuation?' he

went on.

'I have spoken,' the prisoner replied a little wearily. 'I slew the woman. It was the only thing to do. It was right to slay her. If there is anything more to be said let him say it, for I do not understand.' Again he pointed to the police officer.

The judge looked puzzled. 'That man,' he explained, 'is the Government prosecutor in this case. He is on the other side. He is trying to get you hanged, you know, and he cannot speak

for you.'

'Let him speak. He understands,' said the

prisoner.

The Government prosecutor rose to his feet. 'Your Honour,' he began, 'as there is no advocate for the defence, and as I know the prisoner's story and the customs of his tribe, perhaps you will permit me to explain?'

'I am afraid it is entirely out of order,' the judge answered. 'I cannot permit you to appear

for both parties.

'I have already done my duty by the Government as prosecutor, and perhaps my twenty years' experience of the country will enable me to explain to you'——

'Please sit down,' interrupted the judge; and then he asked the prisoner, 'Have you anything

more to say?

'Nothing, sir!'

'Then you plead guilty?'

'I killed the woman, as was right,' the prisoner

answered doggedly.

There was a short pause. The judge was writing, and but for the scratch of his pen and the slow sough of the punkah the court-room was deathly still and silent. At last he raised his head and began to speak in measured tones, detailing the incidents of the crime.

'By Jove!' whispered the police officer to his neighbour, 'it looks as if he were going to give the

poor fellow ten years at least.'

'Look, Carstairs!' came the whispered reply.
'Did you ever see the like in West Africa?'

Carstairs glanced up at the judge, and saw he was in the act of putting on a black cap. The police officer leapt to his feet. 'Your Honour!' he began excitedly—'your Honour! you do not understand! Allow me to explain. I beg of you to defer judgment until to-morrow. I'——

The judge, obviously angry at an interruption unparalleled in all his experience of English courts in the old country, stopped him. 'This

is gross contempt of court, Mr Carstairs,' he said; 'but I shall content myself for the present with asking you to leave.'

Carstairs again attempted to speak.

'If you persist in interrupting, Mr Carstairs, I shall have you removed under arrest.'

Carstairs walked out of the little room, shaking his head as he went, and the youngster in the seat of judgment went solemnly on; but after a while, perhaps because this was his first big case, and because he found himself dealing with the greatest of all things—a man's life—his voice began to falter a little as he spoke the final words: 'I sentence you to be taken to a place to be named hereafter, and there to be hanged by the neck until you are dead. May God have mercy upon your soul!'

After uttering the solemn old formula the judge hid his face in his hands, and the prisoner, understanding nothing, threw a grave, inquiring glance at the native interpreter. That worthy, freed from the supervision of Carstairs, put the matter very shortly. 'Master on high place says, come next moon, you be choked dead,' he said in the vernacular. The prisoner nodded, smiled quietly, and at a signal from his guard turned and marched out between them, his head high and his step firm.

Ten days later a gray-haired police officer, very weary and travel-stained, was ushered into the

Governor's office at headquarters.

'Glad to see you, Carstairs,' said the great man as he shook hands. 'Anything wrong in the Back of Beyond?'

'It is a matter of a man's life,' said Carstairs; 'our new judge has left his velvet gloves at home, I reckon. He is like the rest of them—all iron hand at first, you know.'

The Governor smiled. 'Rather too conscientious and red-tapey is he? What is the

story?'

'It concerns a petty chief, sir, from the Borderland of Things, away two hundred miles behind my place. He is a fine, big, upstanding fellow, six feet on his naked heels, chest like a bull, and a fighting-man every inch of him, besides being as loyal as they make 'em. One day he was watching a favourite wife of his chopping sticks, leaning over her while she worked, and a splinter flew up and cut his eye open a bit. That would have been all right if the wound had not begun to fester, so that there was some danger of his losing his eye altogether. The wound would not heal, and he was obliged to call in medical attendance—the local witchdoctor, of course. There were the usual expensive ceremonies, and at the end of them the doctor got up and said that the eye was bewitched, and would not get better until the lady who had done the deed had departed this life. So the elders of the tribe were called together, and a great pow-wow was held to decide the manner in which the favourite wife was to pay her forfeit.

Our chief was very sorry to lose her, but the medicine-man had spoken, so of course she must die. The only question was how. Elder No. 1 suggested the good old-fashioned way—tying her up to a tree and shying spears at her. But somebody remembered that a neighbouring chief had got into trouble with the British Government for doing that. So Elder No. 2 suggested that she should be put into a spiked barrel and rolled down the hill. But the same objection held good—the British Government had forbidden it in the past, and somebody or other had got into serious trouble for doing it. Method after method was suggested, and method after method was ruled out of order on the same groundsthat we had caused trouble in the past, and would do so again in the future. At last some one had a bright idea, and a messenger was sent three hundred miles down-country to the sea-coast. He came back with a coil of the best hempen rope, and the lady was hanged with all due ceremony, in the exact manner of a civilised British execution. They did their little best to please us; and when he was dragged up for trial the prisoner said to me, "If I had thought you were going to make all this fuss I would have sent | you!' he said.

you the woman and got you to hang her for me." That confounded new judge refused to listen to me when I tried to tell him this, and lugged out a black cap he had brought specially from England, I suppose, for such an occasion as this, and said, "May God have mercy on your soul!" at the end of it all, as if the poor fellow could understand it! Faugh! Him and his black cap! How are we going to hold the country if he goes hanging our most loyal chiefs, the men who are doing their best to please us?

'I don't think the man will hang,' laughed the Governor. 'Will you take this back to him?' He scribbled on a sheet of paper and handed it

Carstairs glanced at it. 'Reprieved, and to come up for judgment when called on,' he 'That's better than I murmured to himself. expected.' He saluted and turned to go.

'By the way, Carstairs,' said the Governor

quietly, 'what of that witch-doctor?'

'It's a bit dangerous; but I think it can be managed, sir,' said Carstairs, looking his chief straight between the eyes.

The Governor met the glance squarely. 'Thank

GOLFING NAMES: THEIR ORIGIN, AND SOME TRADITIONS THEREOF, MAINLY OF ST ANDREWS.

By F. KINLOCH.

'WHAT does a name matter?' asks the keen, practical-common-sense if you likegolfer of the present day; and so he goes on his way, quite oblivious of his surroundings, save as they affect his game. It was not always thus; indeed, up to within a comparatively recent time, it was usual, whenever a new course was opened, to devise suitable names for the holes and any outstanding hazards. In the rush and flurry of modern golf, and the extraordinary multiplication of golf-courses, this old custom is fast dying out; the holes are only known by their specific numbers, and the hazards by their nature and That is a pity in itself; but the worst locality. of it is that even the old historical names of holes and bunkers are in many cases sinking into oblivion, for a generation of golfers is growing up which knows little and cares less about the traditions of the courses, and takes no interest in the history of the past.

The present article is an attempt to keep green some of the names which used to be familiar on the more famous golf-links, and to give some reason for their origin, along with any traditions connected with them.

Inevitably we must begin with the mother of all golf-links-St Andrews. Here there has been no formal christening. Gradually, very gradually, as the years have grown into centuries

-for golf has been played at St Andrews for six hundred years or more—have these names been evolved and become, by daily usage, associated with the holes and bunkers. Some of the original names are, as we shall see, quite unknown now; many of them are familiar only to those born and bred in the old gray city, or who have golfed there from childhood; but others there still are whose reputation is world-wide wherever golf is played.

How came these names? What paramount influences were at work to determine them? Though the writer has had generous help from various competent sources, it is with considerable diffidence that he approaches this subject, and he does not claim to be correct in every version

that he gives.

So far as the old names of the holes are concerned, it is certain that these originated altogether from their immediate surroundings, and were not born in a night, but came slowly, as men talked of their games. As the surroundings changed, as happened in one or two cases, the old names fell into desuetude. So we may take it that the names of the holes are all topographical. Those of the bunkers are different. Some, of course, spring from the same source; but others and it is with these that the traditions of the links are mostly associated—take their origin from golfing personalities of the past, while fancy or contemporaneous historical events are

responsible for the remainder.

Most golfers, at any rate those who have played at St Andrews, and have devoted any interest to the story of the old links, are aware that up to the first years of the nineteenth century there were only nine actual holes in play, and yet it was a full eighteen-hole course. seeming paradox is explained by the fact that the same holes were played on the homeward journey as on the outward. It is, indeed, probable that at one time there were ten holes, for in ancient maps the last hole is called the Hole o' Hill, and figures as being on the hill where now stands the Martyrs' Monument; and it is very likely that there was another hole between it and the burn. But of that we have no concern What is proposed now is to give the original names of the nine holes, with reasons, speculative in some cases, for their origin; similarly, the names of the full eighteen holes as at present played; and then the names of the best-known bunkers, with any traditions or memories attaching to them.

The first hole was played from somewhere near the present first tee to a green over the burn, which was crossed by the old stone bridge. This hole was called the Bridge Hole or Road Hole, and the reason is, of course, obvious. Before we leave this hole it is worth while calling attention to the spelling of the name of the 'burn;' in all the old maps it is spelt

Swillken, not, as at present, Swilcan.

The second hole was situated practically where the present hole is now, but was of course approached from the left, as in those days whins grew right up to the bunkers on the right, and was known originally as the Hole o' Ba' Field. This name has entirely disappeared; but the writer suggests that in old days the students of St Andrews University used to play at games of ball in the adjoining field, afterwards appropriated by the North British Railway Company, just as they do now in the field beyond the railway.

The old third hole, situated very much on the present site, was called the Cartgate, probably because near by there was a cart-road leading down to the sea, 'gate' being Scottice for road.

The fourth, similarly played down a lane of whins, was called Cunnin Links. That was the name for the benty ground on the left. there be any connection between 'cunnin' and 'coney'? Those links were specially the abode of rabbits in early days.

The names of three of the holes we have just been discussing are not now familiar; but those of the remaining five are still in existence.

The fifth was played over Hell Bunker on to the Elysian Fields, then a second drive past the group of bunkers known as the Beardies (of these bunkers more anon), and then a shot across a marshy desert over a big bunker on to the

great green. It was called the Hole o' Cross on account of that approach shot.

The sixth was played down a lane, not of whin, but of heather; hence the Heathery Hole. It was also known as the Hole o' Shell, because the putting-green used to consist of shelly soil

rolled flat, there being no turf.

The seventh, as now, was called the High Hole, from its commanding position overlooking the Eden. In one old map it is designated the Hole of Rhi; but the writer has not been able to discover any satisfactory explanation for that curious name, and it is not generally accepted.

The last two were, as they are to-day, the Short Hole and the End Hole or Hole o' Turn. It may be interesting for the present generation to know that as late as the 'fifties of the last century the course to the End Hole was barely twenty yards wide in places, cut out of deep heather.

As play increased and the course got wider it became necessary to duplicate the holes, and the course practically as it is just now was The following are the names as instituted. known at the present day:

. Burn Hole. 2. Dyke Hole.
3. Cartgate Hole.
4. Ginger-Beer Hole.
5. Hole o' Cross.

 (Seems to have no name.)
 High Hole Home.
 Heathery Hole Home.
 Hole o' Cross Home. 14. Long Hole. 6. Heathery Hole.
7. High Hole.
8. Short Hole. Cartgate Home.
 Corner o' the Dyke. Road Hole

9. End Hole.

18. Home, or Tom Morris Hole.

Of these, only two require any additional notice—namely, the Ginger-Beer Hole and the Tom Morris Hole. As a matter of everyday golf, it is the fifteenth rather than the fourth which is usually known as the Ginger-Beer Hole; but that is immaterial. The hole, be it the fourth or fifteenth, took its name from the fact that in old days—that is, in the 'forties—there was a stall where ginger-beer, and possibly something stronger, were sold to thirsty golfers. This Hole is immortalised in a picture by Mr Charles Lees, wherein are depicted all the best-known golfing bucks of the day, most immaculately dressed in the fashionable garb of the periodtall hats and swallow-tail coats with wonderful They are parading over the puttinggreen with ladies in their very smartest frocks, while in the background is seen a little girl seated behind a stall selling apples and ginger-One wonders at the appearance of all that rank and fashion far out on the links of St Andrews; but of course the meetings of the club were always well attended by the county folk of the Kingdom of Fife, and it was, as it still is, the proper thing to come into St Andrews on the medal days. Still, this picture of the Ginger-Beer Hole shows no signs of strenuous golf; rather does it suggest a picnic.

The last hole is now hallowed by the revered name of Tom Morris, and nothing could be more appropriate if only one could persuade people to call it so. The old man looked on that green, which lay just under the windows of his shop, as the apple of his eye. No practice putting could be indulged in if he were about, and woe betide the luckless caddie who dared to drive a ball off it!

So much for the holes at St Andrews.

As regards the bunkers, they number, it is said, more than two hundred and fifty, and according to the old maps most of these have some kind of name. Naturally it is impossible to follow them *seriatim*; we can only make mention of the better-known hazards. It is probably best to take these in order from the first tee; and as most of the bunkers were named in the days when there were only nine holes, we had better assume that we are playing that most difficult and narrow course.

The first hole had no outstanding hazard save the Swillken Burn. In front of the tee going to the old second hole, at a distance of about seventy yards, was, and still is, a long bunker with a high bank. This is the Scholars' Bunker, so called, it is said, because boys were very proud when they succeeded in carrying it from the tee.

Farther on, in the middle of the course, is a big round bunker, which is often erroneously called the Corner of the Dyke Bunker, but which should be known as Cheape's, after the original owner of the links. Passing without comment the three hazards that guard the green en echelon, we pause at the little round one just beyond it. Its real name is Jackson's Wig, and the inference is that the said Jackson's wig resembled it; anyhow, it is a memento of the days when some golfers played in wigs.

Between the second and third holes are several bunkers which we must notice. A small one barely fifty yards from the old tee should be known as Grant's Bunker, because tradition says that John Grant of Kilgraston, one of a well-known coterie of golfers some seventy years ago, found great difficulty in avoiding it with his tee-shot. We can almost hear the genial chaff, 'Into that bunker again, Grant. I vow it must be called Grant's Own.'

Beyond Grant is a very tiny pot, which is famous as Deacon Syme. No ecclesiastical dignitary was the said Syme, but one of the deacons of the Trades Guilds, a position similar to that held by Bailie Nicol Jarvie. This bunker is now a terrible trap for the long drivers from the fifteenth tee, and is the subject of much execration.

We now come to the far-famed Principal's Nose. Surely no bunker has been better named. The hazard is triple, a cluster of three, a nose with its nostrils, and one can have no difficulty in imagining some irascible old principal of the university, with a large and bulbous nose which grew from red to purple as he delved in its depths. It is said that the particular principal

who made this bunker so famous was called Haldane.

The bunker short of the hole is called after it, the Cartgate.

On the left, going to the fourth hole, are three little pots known as Rob's Bunkers, but no trace of Rob can be found.

A hundred yards or so farther on is another famous trap-namely, Sutherland's Bunker; and the writer is fortunately able to give at first hand the story of how that bunker—which has suffered nearly as much abuse as Deacon Syme-came by its name. It should first be explained that Sutherland was a very great character at St Andrews in the 'fifties and 'sixties. A good golfer himself, he took a very great interest in the rising generation, and he was also-so far as the links were concerned—most conservative, and any tinkering or filling up of bunkers moved him to great wrath. Some extra long driver on the green committee of the day had driven into this small trap, and the powers that were in authority at the time, on his instigation, promptly filled it up. Forthwith there were loud and deep complaints, and Sutherland was foremost in demanding that the bunker should be opened up again. On the 9th of August 1869 there was a dinner-party at Strathtyrum, a neighbouring country-house, and among the guests were the writer's father, the late Sir Alexander Kinloch, and Mr R. Dalzell, C.B. (both, it may be said, subsequently captains of the Royal and Ancient Golf Club). Needless to say, the one topic at dinner was the vandalism of the green committee. It was not to be allowed. So after dinner the guests sallied forth in their evening clothes, routed up the gardener, persuaded him by promise of gold not only to supply them with spades and a wheel-barrow, but to give them his help, and made their way to the links, a good mile distant. They laboured all night, and by morning the bunker was restored. Then on a piece of paper they wrote the name Sutherland, put it in a prominent place in the bunker, and went off to a well-earned rest. Of course every one thought it was Sutherland's work, and by the name Sutherland the bunker is known to this day. The two conspirators remained mute for many years; but their friends wondered why they played so badly for a week after that night in

Beyond Sutherland, the Cottage Bunker stretches across the links; while short of the hole are the Students' Bunkers. Why these, more than any others, should have been selected as the particular hazard of the students it is hard to say, unless it be that they often used to play four holes out and four holes home, turning at this point.

The Hole o' Cross must surely, in the old days, have been as fine a hole as any golfer could wish for. First there came three coffinshaped bunkers, very bad indeed to get out of,

called the Graves. It must be said that this part of the course is gloomy in its nomenclature, for the great Hell Bunker comes next. prime this was the mightiest bunker known. There was no shirking it, no playing round it for safety. Somehow or other the golfer had to carry its depths. How are the mighty fallen! The days of Nowadays Hell has no terrors. Calvinism are past. There is no Hell at St Andrews, so they say—at least not on the links; Calvinism are past. and in truth the great hazard is a travesty of its former self. Nevertheless there was a time when it was indeed a terror to the evil golfer, as one may judge from the following verses composed by that gifted, though practically unknown, genius and philosopher, Patrick Proctor Alexander:

What daring genius first did call thee Hell? What high poetic, awe-struck grand old golfer? Misdeem him not, ye pious ones, a scoffer; Whoe'er he was, the name befits thee well. 'All hope abandon, ye who enter here,' Is written awful o'er thy sandy jaws, Whose greedy throat may give the boldest pause; And frequent from within come tones of fear, And—for mere mortal patience is but scanty—Shriekings thereafter as of souls in pain, Dire guashings of the teeth, and horrid curses.

Just beyond Hell is the subsidiary Devil's Kitchen or Devil's Pot.

Once, however, safely over Hell, the ball lay teed on the softest, greenest sward imaginable, stretching for three or four hundred yards like a putting-green all the way. Here was the golfer's true happiness; it was Elysium, and the Elysian Fields stretched before him. But even now he had to exercise caution; he had to beware of the Beardies, those four queer-shaped, deep holes which still seem to suck the ball into their clutches if it comes at all near them. writer has been at pains to attach some fantastic, mysterious origin to the curious name. It was suggested to him that it might mean the home of the gnomes or elves; but a diligent search of Jamieson's Scottish Dictionary lent no support to this rather fascinating notion, so we must fall back on the more prosaic reason that the benty grass used to grow in beard-like fashion down the steep sides of the bunkers. Once the player was past the Beardies the stroke was still critical, and it is rather remarkable that the hazards which had to be crossed have no name of any significance.

The straight road from the Hole o' Cross to the Heathery Hole was, as it is now, beset with bunkers large and small. The best known of these is perhaps Walkinshaw's Grave, on the face of the plateau. The said Walkinshaw was a left-handed player who had a rooted dislike to the bunker, which in consequence bears his name. Under the green there is a small, almost invisible, trap which collects balls from every quarter. The proper name for this hazard has given rise to a diversity of opinion. Some call it the Lion's Mouth, others the Cat-Trap. The writer has

always known it as the Cat-Trap; the Lion's Mouth, so far as his recollection is concerned, being a bunker farther on, most of which was filled up long ago. Both these names are, of course, fanciful.

Farther on, to the left, is Nick's Bunker; but who Nick was is not known.

From the Heathery Hole to the High Hole a bunker with a high facing bank had to be carried, and this used to be known as the Stroke Bunker, the reason being easy to guess.

Short of the hole are three bunkers which lie in a parallel line. The small one in the middle is historic under the name of Strath, and the large one to the right is the Cockle. Of these, Strath deserves a word to itself. In the early 'seventies Davie Strath was the one man who could stand up to young Tom Morris, and many is the tussle they had. It is fitting that the memory of so fine a golfer as Strath should be kept alive on his native links, even though it be by a bunker. Strath Bunker has been responsible for the loss of many medals; and in last year's Amateur Championship the ultimate winner, Mr H. H. Hilton, was in this same bunker six or seven times out of the nine rounds he played. If it had not already a name, surely it should be called Hilton.

The Short Hole has no hazard with a name, but the End Hole has three which are worth noticing, because they are the only modern or artificial bunkers having names which will last. These are historical, and will always commemorate the Boer war. Side by side, to catch a topped ball off the tee, nestle Kruger and Mrs Kruger, while a hundred yards farther on is Cronje.

And now we have done with St Andrews and its names. It is because no other course in the world can compare with it in this respect that we have devoted so much detailed attention to them. Nevertheless there are names of interest on many other courses.

At North Berwick, for instance, Point Garry is of Gaelic origin, garbh meaning 'rough,' harsh,' or 'rugged;' hence Point Garry—'the rugged point.' Carl Kemp, again, the fourth hole, takes its name from the old fir-wood adjacent. This is Scots, carl being a 'man,' and kemp a verb signifying 'to strive.' What is probably the origin of the name is the fact that in the field where golf is now played the old North Berwick annual games used to be held, and there many a carl strove for mastery. Many golfers have wondered why the sixteenth hole is called the Gate, as there is now no gate near it. The reason is simple. Before the present villas were built along the links there was a farm road, which still exists, leading down to the sea, and a gate opened on to the course quite close to the hole. The Redan is the big bunker facing the fifteenth hole, not, as many imagine, the deep barricaded one on the left of the hole. Judging from the name, one would

have thought that the Redan Hole came into existence about the time of the Crimean war, but that is not so. The hole dates from about 1869, when the first extension of the course was made. The second extension was in 1878, at the time of the Russo-Turkish war, and the narrow pass between Carl Kemp wood and the sea, which has now been much widened, was called the Shipka Pass; but the name is now almost forgotten.

Unlike St Andrews, few of the bunkers have any personal names; but there is one, short of the twelfth or Quarry In Hole, which is called after a very well-known North Berwick character, the late Provost Brodie, and it should be known

as Provost Brodie's Grave.

Musselburgh, once the best nine-hole course in the world and the scene of several championships, has some names of interest, notably the first hole, which is known as the Graves. History has it that many of the soldiers who fell at the battle of Pinkie were buried here, and certainly the mounds over which one putts give some verisimilitude to the tale. The third hole will always be known as Mrs Forman's, after mine hostess of the inn close by. Many a golfer has slaked his thirst at the window opening on to the third green. Then there is that great bunker Pandy, a corruption of Pandemonium, which had to be carried from the fifth tee. It used to be a dreadful hazard, as it was full of stones and the sand was very heavy. It was probably so called in imitation of Hell at St Andrews.

Oddly enough, there are no traditions that can account for any of the Prestwick names; but then Prestwick is of comparatively modern origin, only going back to about 1852. Of course the Alps and Himalayas are easily accounted for, as also the Sea Head-rig, the name of the thirteenth hole, meaning the long, narrow hole stretching like a furrow ('head-rig') along the sea; but one would like to have some reason for the Cardinal's Nob, unless it be simply the desire on the part of the Prestwick golfers to go one better than the Principal's Nose.

At Hoylake the holes have all been named, and these names are in general use, but I am told that the bunkers have none. The interesting names—interesting insomuch as their origin is not patent—are the Dowie (the seventh hole), called after a founder of the club, and one of the first captains in the early 'seventies; and the Dun Hole (the sixteenth hole), also in memory of one of the best known of the early Hoylake golfers, the late Mr John Dun of Warrington.

Not knowing Westward Ho! the writer begged for information regarding the names there, and received a courteous reply, in which regret was expressed that though when the course was laid out every hole, in imitation of St Andrews, was named, these names were now extinct, the only one still retained, and that only among the older members, being the sixth, which is called the Alligator, because of the bunkers which gape at a golfer off the tee. One other name survives; there is a certain patch of ground on the course of the seventeenth hole which is happily known as Abraham's Bosom, because the lies are better there than on the rest of the course.

There are good names on some of the less famous courses. Thus at Machrie, in Islay, the third hole, which is so difficult as almost to be unfair, is known as Mount Zion, because it is so hard to reach. Another is called Willie's Fancy, because Willie Fernie, who laid out the course, declared it was the best hole he had come across. At Newcastle, in County Down, there is a great sandhill which originally had two peaks, appropriately called the Matterhorn. At Machrihanish there is a grim reminder of the Zulu war in Rorke's Drift, while there are Spion

Kops by the dozen.

Yet, comparing these modern names with the old ones of St Andrews, there seem to be an artificiality, a lack of originality, and above all a lack of humour about the former which reflects the spirit of the golfing age. Who would now dare to insult a golfer, especially a bad one, by nicknaming a bunker after him, as is the case of so many bunkers at St Andrews? It has been attempted, to the writer's knowledge, but oddly enough the honour has not been appreciated. Yet the old-time golfer, conscious of his shortcomings, never resented such delicate chaff; on the other hand, he rather enjoyed it. It is to be feared that the succeeding generation will become so matter of fact that even the bunkers will be known by their numbers. That possibly might save a lot of trouble. Instead of saying, 'I got into the bunker short of the green, you could say, 'I was caught in No. 11.' But the romance of golf would be gone, if indeed it has not even now vanished.

THE VALLEY.

HERE, in the valley close and gray,
I longing look to the far-away;
Fain would I to the mountains climb
From the misty lights and the things of time.

Fain am I to breathe purer air,
To gaze on a world more grand and fair,
To look from the mountains and vaulted skies.
To the depths below where the blue sea lies.

The valley is narrow and dark and chill; I often climb to the farthest hill.

Oh exquisite moment! I gain from it

One swift soul-glimpse of the Infinite.

I wonder oft if my life shall be Spent in this valley that prisons me; Or if, through the years I shall patient wait, I shall find at last there's an open gate.

MARY M. CURCHOD (MYRA).

ALGIERS.

THE HEART OF THINGS.

By HENRY LEACH.

LONDON, Yesterday. T has happened twice recently that immediately after travelling in the United States and associating intimately with its people for some time, I have engaged in irregular wanderings on beaten tracks and off them in parts of Europe which count for most in modern development or give promise of doing so. It is when one leaves Fifth Avenue in New York for the Alcala in Madrid, couples fashionable Newport in the same thought with San Sebastian and Cannes, and comes incongruously when in Rome by a remembrance of something seen and done in Washington, that one is made fully to realise the terrific change that is pending in the world and that is coming quickly on. Great enough, sad enough, are the troubles that afflict the Continental Powers in these times, with their greeds and jealousies and constant wranglings; but the mistake that is surely made by the readers of newspapers, and those who only study life and action within the limits of their private gardens, is that by the building of battleships, the strengthening of armies, and the construction of swarms of aeroplanes, the destiny of nations and empires is being steadily shaped and properly guaranteed. The Powers, it is believed, are marking time in a grand wisdom and in a slow and sure development, as they may appear to think, of a new stability of Europe. It is put forward and believed by most students of affairs that at no distant time from now there will be a crash of arms between two of these Powers, perhaps with more than two involved, and that thereafter, with the payment of some indemnities and the transfer of patches of landed property, causing a little change of tinting in the atlases of the world, there will be peace and quietness established for a long period to come. Europe, which has been in a state of rearrangement ever since human beings crawled and lived and fought upon it, is to reach its goal at last. Such confidence would be too utterly stupid if it were real; but every statesman knows that until there is a grand cataclysm of an immensity that is hardly to be conjectured now, there can be no rest and contentment in Europe, and the national progress of the most civilised and cultured people must be pitifully retarded. Subconsciously, if not No. 174.—Vol. IV.

otherwise, every capable man engaged in the higher statesmanship of Europe understands that this cataclysm is sure to come, and all the work that is done now in the way of preparations and of threats and wars is merely temporary. And so the European states go on with their negotiations and their attacks, even though they may be a little conscious that Europe in the bulk approaches some overwhelming change of vaster dimensions and consequence than any that has taken place Those who have not realised the hitherto. coming of this change have failed either because they have not gone about and thought, or because they have not seen anything about it in the newspapers, or because the statesmen on whom they most depend have not mentioned it. Change is so rapid in these days, and the needs of present moments are so intense, that there is some excuse for modern statesmen being so much opportunists as they are, and for their outlook being seemingly so narrow. Just as so many politicians fail to think imperially, and members of Cabinets are not statesman-like in their views and attitudes, so the fault of rulers seems to be that they do not consider sufficiently in terms of eternities or a more intelligible something short of them that is suggested by the property vendor's period of nine hundred and ninety-nine years. Change in these days is terrific in its speed. Men are flying, words unfastened to wire or paper are being sent thousands of miles through plain air, just now I hear that the great inventors have begun to light lamps many miles away simply by the despatch of wireless electricity through space, and the beginning of some amazing changes and controversies is indicated. a hum in all the world, the signs of the great transformation are in the sky and on the earth, and the mind of every human being of intelligence is conscious of the beginning of an upheaval in the state and arrangements of mankind such as the world has never known before. If any reader of these notes has not already put it to himself in this way, he will probably, upon a moment's reflection now, admit the reason in this proposition. In America everywhere, north and south, in Britain's over-sea dominions, and even in the Eastern world there seems to be a strong general tendency to prepare and adapt and be ready for the change. The feelings of the people [All Rights Reserved.] MARCH 28, 1914.

toward the problems of life are different. Conceptions are wider, greater, freer. Only in Europe, one feels, is there hesitation in grappling with the new circumstances, and that is because of the intense and stifling conservatism that pervades the whole European system, its arrangement of Powers and territories, its petty jealousies and its fears, its littleness of design and method.

If this should seem ant-like criticism of an elephantine subject, let us consider two little affairs of recent occurrence. There was the One European Power is in Zabern matter. possession of land taken from another in war, and holds it now in a security which does not always appear absolute. The people living on that land are not wholly favourable to the new possessors, and the old possessors are generally believed to have thoughts of recovery at some future time. As worlds and empires go, the property, though good enough, is hardly worth a nation's perpetual worry; but there it is. Hatreds and jealousies are hotly maintained, soldiers stalk the streets, swords are drawn with little excuse, and, lo! when a young lieutenant thinks that somebody is laughing at him—he is not sure, but he thinks it may be the casethere is tumult and riot, a crisis is brought on, great inquiries are held, and nations nearly shake with anxiety. That is an aspect of the European system and its littleness. I have noticed another affair, suggestive enough in its way, but not of a sort to cause commotion. At a point in the Franco-Belgian frontier there are little towns on either side, and each has fire-engines for the usual protective purposes. The local authorities, for their mutual benefit, have been in the habit of looking upon the frontier line as a theoretical rather than a very effective division in many matters, and have co-operated amicably in various affairs. Particularly when there has been a big fire on one side of the line, the authorities on the other have been in the way of sending their fireengine across to give some help. At these times it has been forgotten that there are such separate entities as France and Belgium, and remembered only that these are men and friends, and that lives and goods are in danger. But something has recently happened—it occurred in February—to disturb this happy state of things, and to remind the people that, even though France and Belgium be excellent friends, the niceties of the European system must be preserved. A big fire broke out on one side of the line, and a call for help went The fire-engine was quickly over to the other. got into order, and it dashed to the frontier line; but there was then a hitch of a kind that had never occurred before. Either because the friendly engine was now propelled in the way of an automobile instead of by horses, or because of some new regulations or warnings that had come along to the guards on the line, it is the fact that the engine was stopped by the military and

Customs authorities across the border, and those in control informed that it could not proceed to the big blaze that was making enormous havoc unless it paid a substantial duty for the petrol that it was carrying for its self-propulsion. point was insisted upon; it was in vain that the men of the friendly fire-engine argued that they had neither the money nor the disposition to satisfy the demands that were made, and that they only desired to use their petrol in the good cause of assisting their friends across the border. The military and the Customs said, 'No; the fire-engine people must pay or go back; and as to the fire, why, what did it matter so long as the European system in its detail and red tape was maintained intact? Greater sacrifices for it had been made than that,' So the fire-engine did go back, and the fire burned splendidly for a long time, and did the most enormous damage. If it is said that there was not much commonsense in this, it must be added that there is not much common-sense in the whole European This fire-engine story is a stupid trifle, no doubt; the Zabern bother may not be much better; but such things as these do illustrate the littleness of the Old World system, and surely also they suggest the impossibility of its continued existence.

* * *

If Europe could only understand the contempt with which the peoples of the New World view these triflings, while these people, with a laugh, get on with their business of shaping the world and making it anew! In Europe we quite understand and appreciate such matters as the Zabern disturbance and the frontier fireengine; and it even seems reasonable to maintain enormous armies and to make a fresh and bigger lot of battleships in every great country every few years; but in America it looks as if Europe in its old age were mad; and when a European goes to the States or Canada for a little while, and becomes impregnated with the New World system and feeling, he too thinks, on his return to the old state of things, that Europe is partly mad. Nothing in the arrangement of the world appears more ridiculous to him than the separation of the Continent into such a large number of complete countries, and all the tremendous cost in money, lives, and hindrances to labour that are involved by such a system. It is not until you contemplate it on the other side of the world, and look at Britain, France, and Germany as they appear on the map, that you realise the monstrous futility of the existing order of things. And just lately they have been making another new arrangement on the Continent, and starting off a new king and kingdom. We may be assured by Europeans that history, tradition, race, language, custom, and also the stimulus of envy and competition in trade demand this arrangement of separation. History and tradition have little to do with the case, since arrangements are being

continually changed, and the tendency is ever toward aggregation. We now have a united Italy and a united Germany, and it is only a little while since there were many little states in place of them. Before the end of their recent troubles the Balkan States felt for a moment a new idea and hope flashing through their mind -the United Balkan States; but they were not strong enough to reach forward to it. Being intensely European, they preferred a little more war and permanent separation, with the prospect of more wars to follow. But yet, in spite of the separatist efforts of the peoples, there is a natural tendency all through Europe toward international collectivism; and if the sun continues to rise and the Europeans continue to live, it is as certain as can be that in due course of time, the result of tremendous pressure of circumstances, there will be a United States of Europe. Racial feeling between the nations, discovered to have been largely fostered by ruling and other interested classes, is largely breaking down as the result of increasing commerce, faster and more thorough means of communication, the increase of travelling and intermingling, the widening of thought, and the spectacle of the wondrous blending of blood that is going on in America, and the splendid results thereof. The language difficulty is slowly breaking down; it would disappear quickly enough if the nations would agree on the best to adopt. There are only three practicable propositions before us: English, French, or some such 'universal' language as Volapuk or Esperanto. Whether it is so or not, the idea of the new language appears to most people as too faddish and whimiscal; they want a language that is already in use. French has prestige because it is the 'diplomatic' language, and also it is in fairly common use throughout the European countries-more so, certainly, than any other language, except English. The latter has the enormous advantage of being already the chosen and universal language of the greater part of the New World; and when we come to a New Europe the influence of the New World will be paramount in such matters as this. Depend upon it, when we have a United States of Europe, the language which will surely make itself the universal one will be English Then Socialism and the doctrine of the brotherhood of man is destined to have a quick and enormous influence in bringing about the collapse of the present European system and the federation of states as they exist at present. Socialism, as it is practised at present, abounds in faults, injustices, and impossibilities; but it is becoming fairly clear that it will soon have the power absolutely to prevent war, and will exercise it. Do people in general properly realise that as soon as ever war becomes impossible the system of the separation of states must collapse for want of reason, and the United Europe is in full view? The travellers from afar that wander from capital to capital in the Old

World, just as they do from Ohio to Arizona in the New, see in the separation of the states, the different languages, coinages, and customs only an absurd nuisance, and they do not appreciate it in any other way. When the principle of unity is spreading in every department of life and thought throughout the world, and exercising enormous influences, it is not applied only to that subject where it would be most effective and powerful in its good to humanity. The Great Powers adopted the grand air of might and superiority toward the little Balkan States when the latter were at war with each other, and partly in the interests of humanity, but more chiefly in the interests of themselves, they intervened. But in effect how much better are the European Powers than the Balkan States? The New World sees only this difference, that the Powers conduct the same principle on a larger and grander scale, and one far more disastrous to humanity.

America has her little troubles of war, but she does not seek and does not provoke them. One of the most striking differences between the outside appearance of life in America and the same in Europe is that in the former there is no trace of militarism, while in the latter the picture is blotted with soldiers. There are soldiers, soldiers everywhere, and the guns of battleships at practice boom right round the Continental shore. But in the New World they just go on with their work and try by progress to make life a better and a brighter thing. The American system abounds in faults, but mostly they are the faults of youth and inexperience. Art has already begun to have a strong refining influence throughout the country. The graces of life are finer in Europe now than in any other part of the world; but if the American system embraces less of such graces, it has more greatness, more fullness, and more moral health. American life and its value are seldom properly represented by British critics; there is too much either of flattery or stupid contempt; seldom fair examination and proper appraisement. Because this is so, and knowing something of the subject, I have been deeply impressed by some thoughts upon it which have been infused into a popular novel of the moment, and they have led to these wandering reflections upon the European system and the inevitable change that must take place. I was sitting out in the sunshine recently, not far from Toulon, and I read this book by Mr H. G. Wells to an accompaniment of the thunder of battleship practice in the distant harbour. While these trials were proceeding, and as I passed lightly over a piteous love-story, something went wrong with one of the cruiser's guns, there was a crash of enormous intensity, and the lives of a few more Frenchmen, martyrs to the European system, were stopped. Those who read Mr Wells only for his story, or criticise him for his art, will

probably have much to complain about in his lengthy interpolations about the New World; but to those who know it and understand it. they are as a refreshing and welcome truth. He tells us that New York at the beginning was extraordinarily stimulating to him—to his chief character, that is. 'And New York,' he says, 'keeps the promise of its first appearance. There is no such fullness of life elsewhere in all the world. The common man in the streets is a bigger common man than any Old World city can show, physically bigger; there is hope in his eves and a brave defiance. New York may be harsh and blusterous and violent; but there is a breeze from the sea and a breeze of fraternity in the streets, and the Americans of all people in the world are a nation of still unbroken men.' Mr Wells is fascinating when he goes on: 'This amazing place had never had a famine, never a plague; here were no temples, no priesthoods dominating the lives of the people-old Trinity Church embedded amidst towering sky-scrapers was a symbol for as much as they had of all that; and here too there was no crown, no affectations of an ancient loyalty, no visible army, no traditions of hostility; and every one I met had an air as if he knew that to-morrow must be different from to-day, and different and novel and remarkable by virtue of himself and such as himself. I went about New York with the incredulous satisfaction of a man who has long doubted, to find that after all America was coming true. The very clatter pleased me, the crowds, the camp-like slovenliness, a disorder so entirely different from the established and ac-

cepted untidiness of China or India. Here was something the Old World had never shown me, a new enterprise, a fresh vigour. In the Old World there is a change, but it drives men before it as if it were a power astride them, and not in them. they do not know, they do not believe; but here the change is in the very blood and spirit of mankind. . . . That sense of incurable servitude to fate and past traditions, that encumbrance with ruins, pledges, laws, and ancient institutions, that perpetual complication of considerations, and those haunting memories of preceding human failures which dwarf the course of destiny in Europe and Asia vanish from the mind within a week of one's arrival in the New World. . . . All America, North and South alike, is one tremendous escape from ancient obsessions into activity and making.' I have made such a lengthy extract because in reading it for the first time I felt an indescribable sense of elation as one who finds truth at last through congested masses of obstacles. Nearly every honest man who has visited America has felt these same sensations, though he could not have expressed them. Some people have not liked them; the obsessions of Europe, after all, are a great habit, and they go deep into the nature of the European. Mr Wells will not expect everybody to share his spirit and his fancies in this matter. To me they so very well stand as truth told for the first time, and they have brought up from the bottom of my mind many thoughts, impressions, and beliefs that were planted there as I wandered through the States, and which have lain in a subconscious state since then.

A KNIGHT ON WHEELS.

CHAPTER XVI. -- OMEGA, CERTAINLY NOT!

MISS SYLVIA MABLETHORPE—'also known to the police,' to quote her unfeeling papa, as Dumpling, Dumps, Daniel Lambert, and The Tichborne Claimant—sat upon the high wall which enclosed the demesne of Red Gables, gazing comfortably up and down the long white road. In her lap lay cherries, in her hand a novel. It was a hot summer afternoon. She had exchanged greetings with the local policeman, various school children, and the curate, all of whom had passed by upon their several errands within the last half-hour. For the moment the road was clear, and Dumps had leisure to resume the pursuit of literature.

But she had barely covered half-a-page when there fell upon her ears the sound of a horse's hoofs. Dumps, however, did not raise her eyes from the not very interesting volume before her; though it may be noted that she had looked up readily enough upon the advent of the curate, the policeman, and the school children. All of which was a sign that Dumps was growing up. Indeed, she was now sixteen, and was to go

abroad in a few weeks to undergo that mysterious feminine process known as 'finishing.'

The clatter of hoofs grew louder, slowed down, and came to a stealthy stop just opposite to that part of the wall whereon Dumps was seated. She looked up lazily, to find a pleasantly sunburned youth of twenty-two removing his cap.

'Hallo, Derek!' she observed casually. 'That

you?'
Master Derek blushed guiltily.

'Yes,' he said. 'Good-afternoon. I only got back from Aldershot last night.'

'Oh! Have you been away?' inquired the heartless Dumps.

'Four months,' replied Derek, in tones of respectful reproach.

'And now you are home for the holidays?' remarked Miss Mablethorpe brightly.

'Long leave,' corrected Derek in a humble

'What fun it must be,' continued Sylvia, 'living in a tent for weeks and doing nothing!' Second Lieutenant Rayner, who had just spent

four strenuous months under canvas or on manœuvres, ending with a route march in which his battalion had covered a hundred and thirty miles in four days, smiled wanly. No man is a hero to the girl with whom he has played in infancy.

'Topping weather, isn't it?' he observed pre-

sently.

Dumps agreed, sunning herself luxuriously. 'Does your mare eat cherries?' she asked.

'No; but I do,' said Derek with great boldness. Dumps threw him down a couple, and continued, I am waiting for dad. He is correcting proofs—very cross. When he has finished we are going out in Boanerges.'

'Have you still got Boanerges?' asked Derek

incredulously.

'Yes; but he is on his very last legs. have a new car coming.'

'What sort?'

'A Britannia. It has been specially selected for us,' said Dumps with pride, 'by-by an official of the company. The front seat is being put a little forward, so that I can drive.

A few years ago Master Derek Rayner would have greeted this announcement with some exceedingly witty and caustic comments. Now he merely murmured reverentially, 'I expect you will make a ripping little chauffeur.'

'I shouldn't wonder,' agreed Dumps com-

placently. 'Where are you going?'

'Oh, just for a ride,' said Derek. 'Are your people quite well?

'Yes, thank you.'

'Tell Mrs Mablethorpe I was asking for her,

will you?'

'I will make a point of it,' said the impervious Dumps. Then, relenting slightly, she inquired, 'Are you going to tennis at Oatlands on Thurs-

'Yes,' said Derek eagerly. 'Would you mind

being my partner in the mixed doubles?

'Is that a sudden inspiration?' asked Dumps. 'No-really. I have been meaning to ask you for weeks. That's why I rode over here this afternoon,' blurted out Derek.

'I thought you said you were just out for a ride,' remarked Miss Mablethorpe. (It is quite a mistake to suppose that it is only small boys who are cruel to the humbler members of creation.)

Derek floundered helplessly, and was dumb. From afar came the melodious toot of a wellmodulated Gabriel horn. Dumps sat up, and looked sharply up the road.

'Well, anyway, will you be my partner?' asked Derek, lifting his eyes once more. He was surprised and not a little gratified to observe that Miss Sylvia had turned excessively pink.

'Yes-perhaps. No. All right,' replied the girl shortly. 'I must go now. Good-bye. See

you on Thursday.'

By way of intimating that the audience was terminated, Miss Mablethorpe swung her ankles

-they had grown quite slim those days-over the wall, and disappeared with a thud. Mr Rayner, on the whole much puffed up, galloped away.

Two minutes later a motor-car, consisting chiefly of a chassis, with a single wooden seat lashed to the frame, slid to a standstill outside the gates of Red Gables. On the back of the seat, in bold letters, was painted the legend, 'Britannia Motor Company, Coventry.' In the seat sat Philip.

The car had already stopped when the gates were swung open, and Dumps appeared, smiling welcome. 'Hallo, Philip!' she said. 'Is this

our new car?'

'Not quite,' said Philip, surveying his dingy, workman-like equipage. 'This is my service They are sending yours on Monday.'

By this time the girl had clambered on to the back of the chassis and ensconced herself upon the petrol-tank. Philip, turning the car in through the gates, drove up the short straight avenue to the front door. The purring of the big engine ceased, and the pair, having alighted, passed arm-in-arm, like brother and sister, into the presence of Mr Mablethorpe.

That excellent but volcanic author was discovered tearing his hair with one hand and digging holes in a long galley proof (employing a fountain-pen as a stiletto) with the other. 'Hallo, Philip!' he began at once. 'Will you

have a bet with me?

'Certainly,' said Philip. 'What about?'

'I bet you one million pounds,' said Mr Mablethorpe with great precision, 'that the condemned printing firm employed by my unmentionable publishers has taken into its adjectival employment an asterisked staff of obelised female compositors. Consequently I shall have to retire to an asylum. It is a nuisance, because I have just bought a new motor.'

'How are you so certain about the female com-

positors?' asked Philip.

The author pathetically flapped the long printed slip in his face. 'I don't mind correcting misprints,' he said. 'I am used to it. Male compositors cannot spell, of course; in fact, very few of them can read. But they do understand stops; at least, they put in the stops that an author gives them. The female of the species, on the other hand, only recognises the existence of two—the comma and the note of exclamation. These she drops into the script as she would drop cloves into an apple-tart—a handful or two when she has finished setting up the type. At She also sets her face least, I suppose so. against the senseless custom of using capital letters to begin a sentence. Otherwise she is admirably suited to her calling. Look at this!'

He exhibited a corrected proof—a mass of red

ink and marginal profanity.

'I am feeling better now,' he said. 'I have written both to the publisher and printer. The letter to the printer was particularly good. Have a cigarette? What have you come to see us for -business or pleasure?

'Business,' said Philip. 'Public or private?'

Philip considered. 'Private.'

Mr Mablethorpe turned to his daughter. quisitive female,' he thundered, 'avaunt!'

'Oh, it's not private to Dumps,' said Philip. 'I have been offered a new billet, that's all.'

'Then let us all sit down and argue about it,' proposed Mr Mablethorpe with zest. He threw his proofs upon the floor. 'My wife is upstairs, reading the mendacious prospectus of a new Continental spa, and I don't suppose she will develop the symptoms it professes to cure much before six o'clock. Go ahead, Philip.'

'The directors want me to take charge of the

London offices,' said Philip.

'What are the London offices, where are they, and why do they require taking charge of?' inquired Mr Mablethorpe categorically. Like all unmethodical and scatter-brained persons, he had a high opinion of himself as a man of affairs.

'The London offices,' said Philip, 'are in Oxford Street. They consist of a showroom full of new cars—the company gets most of its orders through this showroom—and a biggish garage and repairing-shop at the back, opening into somewhere in Soho.'

'And do they want you to tell untruths in the showroom or wash cars in the garage?' inquired Mr Mablethorpe.

Dumps stiffened indignantly, but Philip

laughed.

'They want me to boss the whole place,' he 'Hitherto they have had a man in charge of the showroom and another in charge of the garage, and there has been everlasting trouble between them. I gather that the showroom man is young—an old public-school boy'

'I know! Wears white spats, and sends for an underling to open the bonnet of a car when a customer asks to see the works,' said Mr Mable-

thorpe. 'Go on.'

'And the repair-shop man is elderly, and Yorkshire, and a ranker. I fancy they parted brassrags from the start, with the result that working expenses are too high '-

'Surprising!' murmured Mr Mablethorpe.

'And I have been told off to go to town and supervise the pair of them,' concluded Philip. 'Shall I?'

'Why not?'

'Well, I shall be giving up my other work,

'What is your other work? Describe one of

your ordinary days in detail."

Philip did so. When he had finished, Mr Mablethorpe said, 'Well, if that is the sort of life your tastes incline to, why not go the whole hog, and get ten years' penal servitude right away? That strikes me as an equally suitable and much more economical method of satisfying your desires. Consider! You would get ten years of continuous employment, of a kind almost identical with your present occupation, and the State—people like me—would maintain you into the bargain. No rates, no taxes, no extortionate tradesmen, no women of any kind! Regular hours, rational diet, and free spiritual consolation! What more could a man ask? True, your hours of work would be shorter than at present; but I dare say that if you were good they would allow you an extra go at the oakum when no one else That's the plan, Philip! Put the was using it. thing on a business footing at once, and get arrested! Don't overdo it, of course. It is no use committing a crime they could hang you for; that would be trop de zèle. Supposing you burn down the Houses of Parliament, or, better still, the Imperial Institute; or get to work on some of your personal friends with a chopper, and carve ten years' worth out of them? Start on Dumps here. She would make a capital subject for experiment.

Miss Mablethorpe turned to the visitor with an 'He will be all right presently, apologetic smile. she said, indicating her parent. 'He is always a little strange in his manner after correcting

proofs.'

She was right. Presently Mr Mablethorpe, who had been ranging about the room, to the detriment of waste-paper baskets and revolving bookcases, sat down and said, 'And you are reluctant to give up your present berth, Phil ?'

'Yes,' said Philip, 'I am. You see,' he added

a little shyly, 'it's my Work.'
'Quite so,' agreed Mablethorpe, suddenly 'You believe that work is the key of serious. Labor omnia vincit—eh !'

Philip nodded, but Dumps inquired, 'What

does that mean, please?'

Her father translated, and continued. 'Philip, let me tell you something. You are in danger of becoming a specialist. Life, roughly, is made up of two ingredients-Things and People. At present you are devoting yourself entirely to Things—to Work, in fact. How many years have you lived in Coventry?'

'About five.'

'Very good. And how many people do you know there? I am not referring to your fellowstokers. I mean people outside the place. How many?'

Philip pondered, and shook his head. 'I don't know,' he said.

'Half-a-dozen?'

'Perhaps.'

'There you are, right away!' said Mr Mablethorpe, with the intensely satisfied air of one who has scored a point. You have spent five years in a place, and barely know half-a-dozen people

there. You are becoming a specialist, my son-a specialist in Things. That is all wrong. Yo are lop-sided. Man was never intended to devote himself to Things to the exclusion of People; least of all you, with your strong gregarious instincts and human sympathies. Isn't that true?'

Philip considered. Long-dormant visions were awakening within him. His thoughts went back to the days when he had decided to follow the calling of a knight errant. That decision had not occupied his attention much of late, he reflected.

'And therefore,' continued Mr Mablethorpe, 'I counsel you to go to London and take up the new billet. Go and reason with the Yorkshire foreman, and pulverise the gentleman in spats, and argue with creditors; go and study People. Study the way they walk, the way they talk, the way they think, the way they drink. You won't like them. They will shirk their work, or blow in your face, or tell you anecdotes which will make you weep. But they will restore your balance. They will develop the human side of you. Then you will be really rather an exceptional character, Philip. Very few of us are evenly balanced between Things and People. All women, for instance, have a permanent list towards People. Things have no meaning for them. A triumph of engineering, or organisation, or art, or logical reasoning makes no appeal whatever to a woman's enthusiasm. She may admire the man who achieves them, of course; but only because he happens to have sad eyes, or a firm mouth, or a wife in an asylum. If the personal touch be lacking, Things simply bore Woman. I once showed an aunt of mine—a refined and intelligent woman-round the finest cathedral in England, and the one solitary feature of the whole fabric which interested her was a certain stall in the choir where a grand-nephew of hers had once sat for eighteen months as a choir-boy! Yes, women are undoubtedly lopsided. Men, as a whole, are predisposed the other way, which largely accounts for what is known as sex-antagonism. Heaven help all novelists if no such thing existed!

'Shop!' remarked the unfilial Dumps.

Mr Mablethorpe, recalled to his text, continued, 'Very well, then. We agree that Things -by which we mean Work-are not the Alpha and Omega of Life. Alpha, perhaps; Omega, certainly not.'

'Don't you mean "Archibald, Certainly Not!"

daddy?' inquired Miss Dumps, referring to a popular ditty of the moment. Mr Mablethorpe took no heed.

'Labor omnia vincit,' he said, 'is only half a truth. There is another maxim in the same tongue which supplies the other half. You can easily commit it to memory if you bear in mind the fact that it ends a pentameter, while the other ends a hexameter. It is: Omnia vincit

He translated for the benefit of his unlearned daughter, and swept on. 'Now consider. If it is true that Work conquers All, and equally true that Love conquers All, what must be our logical and inevitable conclusion?

It was Dumps who answered.

'That Love and Work are the same thing,' she said. Her eyes met Philip's, and dropped quickly.

Mr Mablethorpe nodded his head gravely. 'Philip,' he said, 'you hear the words of this wise infant? They are true. That is why I want you to go and mix with People. You are getting a bit too mechanical in your conception of Life. You are in danger of becoming an automaton. You must cultivate your emotions a bit—Love, Hate, Pity, Joy, Sorrow—if you want to turn into a perfectly equipped Man. Taking them all round, it is impossible to get to know one's fellow-creatures without getting to love them. That is the secret which has kept this old world plodding along so philosophically for so many centuries. So start in on People, my son. Go to London, and take up that appointment. You will regret your old workshop at times. Machinery is never illogical, or unreasonable, or ungrateful; and though it may break your arms and legs, it will never try to break your heart. Still it is only machinery. If you want to attain to the supreme joys of Life you will have to be prepared for the deep sorrows too, and you can only meet with these things by consorting with human beings. You have discovered for yourself—or think you have—that Labor omnia vincit. Go on now till you realise the meaning of the other phrase of which I spoke. When that happens you will have found yourself. You will be poised and balanced. In short, my son, you will be a Man. Now let us scramble for muffins.

(Continued on page 277.)

THE EVOLUTION OF THE HERRING-BOAT.

By W. DUFF.

THE change which the craft engaged in the herring-fishery of Scotland have undergone within the past fifty or sixty years forms one of the most striking and one of the most satisfactory features in connection with the fishing industry. The equipment of the steam-drifter | the gap if they were laid alongside of each other

of the present day is luxurious in the extreme when compared with the open boats of half-acentury ago. From these small open boats of thirty to thirty-five feet keel to the steam-vessels now in use is a far cry; and so great would be

that it would be difficult to find the missing link. Yet the evolution of the herring-boat has been a gradual process.

In the small boats the comforts were of a very antiquated nature; there was not even a 'den' to shelter the crew from the conditions of the weather while snatching a few hours' sleep as the boats hung on to their nets. The only fireplace was an old pot laid upon a few stones in the bottom of the boat, and the sole cooking utensil was a kettle, and some did not even possess that. Along both sides of the boat, two er three feet from the gunwale, were two planks resting upon supports for laying the nets upon, and for the crew to stand on while hauling or shooting the nets. These boats ready for sea cost only from eighty to one hundred pounds. Early in the 'sixties a very marked improvement took place when the 'den' or half-deck was introduced, which added very materially to the comfort of the fishermen at sea. In these dens there were sufficient beds to afford comfortable sleeping accommodation for the crew, a marked contrast to sleeping in an open boat wrapped in a fold of one of the sails. Shortly after, the fulldecked boat came into vogue, which contributed considerably to the prosperity of the herringfishery. Fishermen were, however, very conservative, and were slow to adopt this new and improved build of fishing-craft. As an instance of this, when the full-decked boat came first on the scene it was ridiculed by many of the fishermen along the shores of the Moray Firth, and indeed all along the east coast of Scotland, as being dangerous and unsafe for life at sea. course there was a good deal of truth in this; but though safety-rails were invented and exhibited throughout the principal fishing-towns, for some reason or other they were never adopted. But the spirit of emulation gradually took hold of the fishermen, and a boom in the building of full-decked boats of an increased size took place, while a number of the larger-sized half-decked ones were converted into full-decked vessels, with the result that those who had protested most against them were now most loud in their praise.

The craft at this time were of the 'scaff' or 'fifie' build; and as fishermen were no longer engaged in fishing only on their own local grounds, the question of the best form and build of fishing-boat began to receive great attention. On the shores of the Moray Firth the excellences of the old 'scaff' and 'fifie' were amalgamated; and this produced the model fishing-boat known as the 'zulu,' whose fine lines and yacht-like appearance drew forth the admiration of all. These 'zulu' boats proved very safe, serviceable, and speedy, and were the pride of the fishermen for many years. As far as the writer remembers, the first 'zulu' boat was designed by one William Campbell, fisherman, Lossiemouth, and built to his instructions by Alexander Wood, boatbuilder, of that town. In the principal fishing-towns

and villages south of the Moray Firth the 'fifie' boat, in an improved form, still continued to be used.

As already mentioned, sail herring-boats were gradually increasing in size and value, their dimensions having reached from seventy to eighty feet in length over all, and their value from six hundred to seven hundred pounds. Owing to the great size of these first-class sailing-boats, it was found necessary to introduce into them a steam-capstan for the purpose of saving part of the manual labour incidental to the hauling of the nets and the hoisting of the sails, the foresail alone having a spread of canvas of three hundred and forty square yards. The idea of still further utilising the power of the steam-capstan was frequently conceived, and a Mr Randall of Wick invented a portable propelling screw which was tested in one of the large boats belonging to that port. But the experiment did not prove a success, owing to the fact that the boiler was not large enough to generate sufficient steam.

As the large herring-boats now found it necessary to proceed farther and farther to sea annually, and as they were too heavy to be propelled by oars when overtaken in a calm, their catches of herrings were frequently spoiled and rendered unfit for human food. This led to the idea of applying steam-power to boats engaged in the herring-fishing, and several men of eminence who were entitled to speak with authority on the subject—such as the late Professor Huxley and Mr R. W. Duff, M.P. for Banffshire—frequently pointed out how steam could be utilised to enable herring-boats to reach and return from the fishinggrounds in all kinds of weather. But for a considerable time their proposal did not find favour among practical fishermen. The initial cost of a steam fishing-boat was, of course, much greater than that of a sailing-boat, and so also was the cost of maintenance, since the former required an engineer and fireman, and a large supply of coals. The fishermen, however, like the handloom weavers, were not to be allowed to decide the question of the introduction of steampropelling power into herring-boats. Others interested took the matter in hand, and for several years, from 1882, trials were made with boats driven by steam; but as the venture did not prove very successful, the experiment was abandoned.

Ten years elapsed before steam was again applied. This time the experiment was due to a Mr Stewart, who returned from abroad to his native town of Wick. While sitting on the South Head one day in July in the year 1898, watching the boats lying helplessly becalmed, with their sails flapping against the masts, he determined there and then to order a boat to be built and steam to be applied to it as a motive-power. The order was at once given to a firm in Lowestoft, where the new venture was speedily inaugurated; and by January 1899 the new steam herring-drifter, the *Peep of Day*, was ready for sea,

and put under the command of Robert Cook, who was one of the best and most practical fishermen belonging to Wick. The splendid success of this vessel led to the building of others, and infused such enthusiasm into the fishermen along the east coast of Scotland, even among those who ridiculed the idea of steam, that a boom in drifterbuilding was the result. Such was the demand for the new type of vessel that for several years thereafter every boatbuilder's yard on the east coast was busy turning out steam-drifters with the greatest expedition possible to cope with the urgent demands of the fishermen. This important departure from the long-established system of fishing evoked considerable differences of opinion, which were somewhat emphasised by the fact that former attempts in the same direction did not come up to expectation. In none of these ventures, however, were the boats of such a description as to enable them to prosecute the fishing industry successfully. They were rather small, and their engine-power was so deficient that they were unable to steam against a strong headwind.

The steam-drifters of the present day are handsome vessels, well engined, and can attain a speed of nine or ten knots an hour. general dimensions are: length, eighty to ninety feet; breadth, seventeen to eighteen feet; depth, nine to ten feet. Their cost, ready for sea, varies, of course, according to size and materials. Most of the vessels are constructed of wood, and these cost from two thousand to two thousand four hundred pounds; while a number are built of steel, and range in price from three thousand to three thousand four hundred pounds. contain all the latest improvements, and comply in every particular with Board of Trade requirements. As an instance of their safety and superiority, it may be mentioned that the fatalities in connection with the herring-fishery have been infinitesimal within recent years compared with fifty years ago. It is also worthy of record that these vessels scarcely ever remain in harbours through stress of weather—which is another strong testimony to their seaworthiness. The accommodation for the crew is provided in a commodious cabin aft, there being berths for the whole crew of nine men; while the forecastle is fitted as a storeroom for gear of all kinds. The cabins are furnished with tables, lockers, mirrors, and all the necessary fittings; while the floors are covered with fine linoleum. The bridge is surmounted by a wooden wheelhouse, which encloses the steering-gear, compass, and engine-room telegraph. The skipper, in this wheelhouse, looks as important when making for a port as a captain of a large American liner.

It must be admitted that the intelligence and concentrated watchfulness which the new type of vessel requires have been wonderfully mastered

by the fishermen. The advent of the steamdrifter has completely changed their outlook and condition of life; it has filled them with new aspirations and ideals, and made them ambitious in many ways. In fact, the bulk of the fishing population is now living in an environment which in former years would have been considered out of the question. That the change has been altogether for the better many of the older fishermen will not admit. They maintain that under the old system of working they were their own masters, managing their affairs in their own leisurely fashion. Still, no one who has had any experience on board the modern drifter would care to go back to the sailing-boat, with its hazardous ways of working. But, alas! the picturesqueness of the brown-sailed boats which were often seen on a summer forenoon leaving the harbours of such fishing centres as Fraserburgh, Peterhead, and Wick will soon be a thing of the past, as in a few years the sail herring-boat will be entirely superseded by the steam or motor drifter.

It may be of interest, in connection with the great progress which the fishing industry has made, to compare the value of the fishing-boats and their gear of fifty years ago with that of the present day. In 1862 the value of all fishing-boats and their gear belonging to Scotland was estimated to be seven hundred and forty-seven thousand eight hundred pounds, while at the present day it amounts to the enormous sum of four million seven hundred thousand pounds. The number of boats, owing to their great size and value, is of course reduced, and the number of fishermen engaged in the various branches of the fishing industry is three thousand less than the number employed fifty years ago.

Though it is hardly to be expected that for some time at least there should be still further improvement on the present efficiency of the herring-boat, who knows what may yet be the future of the turbine-engine? With regard to the motor-boat, fishermen did not take kindly to it, especially for the prosecution of the herringfishing. As no suitable motor was invented before the introduction of steam-drifters, fishermen would not now be content with anything short of the most powerful and efficient craft in the prosecution of their calling. The writer some years ago was explaining to a Banffshire fisherman the economical advantage of putting a motorengine into his 'zulu' boat, and the latter replied, 'Na, na; I maun ha'e steam or nane ava.' However, great progress has been made since then, and motor-power is being gradually introduced into a few of the remaining large-sized sail-boats; but it requires to be brought to still greater perfection before the majority of the fishermen can be induced to accept it in their deep-sea herring-boats.

'UGGINS.

CHAPTER III.

MONTH passed, and no one but 'Uggins was aware of the full extent of his discomfort. Outwardly, things seemed to be moving with unexpected smoothness.

The very impossibility of adapting himself to his new environment proved his salvation as far as appearances were concerned. He was too crude to attempt to hide his crudity, and so, unconsciously, escaped vulgarity, with the result that he awakened in those who met him not

scorn but amused pity.

Adolphus was the more surprised of the two. He had believed it possible that his temporary adoption of 'Uggins as his uncle would ruin his own social standing—in England at any rate. He contemplated the prospect with perfect equanimity; he had, in fact, several epigrams in course of preparation to do justice to his expulsion. But the expulsion never came, for the general feeling in his set was that his action, though a little too daring, was by way of being magnificent. Of course they believed that 'Uggins was a real uncle.

'What I mean is,' said General Haydock to Lady Bamfield, 'that it's jolly decent of him not to be ashamed of the old man. "I-am-an-upstart, my-father-was-a-pauper, take-me-or-leave-me" sort of thing, don't you know. And, dash it all! for my part I am content to take him at that.' And such, with a few exceptions, was the pre-

vailing sentiment.

Lady Bamfield had certain subtle reasons of her own for agreeing whole-heartedly with the General; and, further, for impressing his opinion on the rest of her set-reasons not wholly unconnected with the fact that she possessed a marriageable daughter, and that Adolphus was a bachelor. 'Such a dear old man—no pretence!'

was a phrase constantly upon her lips.

In the mistaken belief that Adolphus cherished a very deep affection for his uncle, she went out of her way to be nice to 'Uggins, and to put him at ease. At the Opera one night, for example, she chatted to him in a confidential undertone at the back of the box during the whole of the second act of Tannhäuser, leaving Adolphus to her daughter, and was not the least offended when she discovered that 'Uggins was sleeping.

Before they parted she had invited Adolphus and 'Uggins to spend a week at her country-house. Adolphus at once accepted for them both.

'Yer don' mean ter say as I've got ter go an' stay wi' them, do yer?' asked 'Uggins miserably when they were alone again.

'Of course! We've accepted. You need not

worry. You are doing splendidly.'

'Ho, am I?' replied 'Uggins. A moment later he added, 'I shall be jolly glad when the three months is up, thet's all!'

'You aren't very gracious, Uncle Peter. And

you have another five weeks yet, you know.'

It was the first time that 'Uggins had openly confessed, even to himself, that he would be glad when the three months had passed. The novelty of having an unlimited amount of food had worn off with satiety. This, together with similar comforts of a purely physical nature—of which he soon became unconscious-was the only immediate compensation for the nervous strain and the boredom of his position.

The days dragged on with increasing weari-In the morning he would accompany Adolphus in the process of dropping in upon some of the latter's numerous acquaintances. In this way a small party would be formed for the day's amusement. They would lunch at a restaurant, whose entire staff of waiters ceased their normal functions, as 'Uggins firmly believed, to watch his efforts with the assortment of knives and forks, specially jumbled beforehand for his further confusion. Then they would perhaps motor to Ranelagh.

Now and again one of the party would throw him a remark, thereby increasing his discomfort. For the most part he would sit silent, an odd blend of surliness and deference. From time to time he would cast an envious glance as the

motor passed a crowded public-house.

The evenings he found hardest of all. some gastronomic reason—probably the result of his sudden feasting after long abstinence—he was invariably assailed, immediately after dinner, with an almost unconquerable sleepiness. Wherever he happened to be-at the house in Park Lane, at the theatre, or anywhere else-his head would begin to nod, and, unless Adolphus were within easy reach, he would soon be snoring; from which state it was extremely difficult to arouse him.

He had one secret source of strength that nerved him to continue the struggle; beneath his pillow he kept the current copy of The Fish-Vendor's Gazette. It helped wonderfully. He would produce it during the tiresome and meaningless process of dressing for dinner, when it would help him to conquer that growing desire to slip quietly out of the house and disappear.

When the time came for him to spend the week at Lady Bamfield's house at Goring he had

just a fortnight left.

'It caun't last for ever, thet's one thing!' he repeated to himself constantly as he and Adol-

phus motored down.

Now, although Lady Bamfield, since giving the invitation, had assiduously boomed 'Uggins as a dear old man, she realised that the novelty of him might soon wear off, and so resolved to leave him with her other guests as little as pos-There was only one way of doing this, and that was to monopolise him herself.

'UGGINS. 267

She was at heart a devoted mother, and in the furtherance of her project was not going to stick at trifles. On the first morning she took 'Uggins for a walk to Pangbourne. Between lunch and tea she punted him up and down the backwater. She almost succeeded in making 'Uggins comfortable, for which he showed an obvious and almost pathetic gratitude. He confided in her that he did not care for high life. He even told her about the fried-fish shop—told her about it at great length. And she flattered his own good sense and the generosity of Adolphus.

Really, Lady Bamfield deserved success. She had foreseen everything, except 'Uggins's fatal sleepiness. It may perhaps be argued that she ought to have been on the lookout for 'Uggins's sleepiness in view of her previous experience at the Opera; but the fact remained that she was not.

It happened, of course, after dinner—a more than usually excellent dinner. Bridge was in progress in the hall; and 'Uggins was sitting beside his hostess on a dangerously comfortable divan.

Under the combined stimulus of her chatter and a system of self-administered pinches, 'Uggins managed to keep from dozing, although his expression may have been a little strained. But when the local doctor—who had been asked to complete an odd table—was called to an urgent case, Lady Bamfield was compelled to take his place, leaving 'Uggins alone—alone on the divan!

Gradually the severity of the pinches was relaxed; then they were forgotten; and a couple of minutes later 'Uggins, losing his balance with his consciousness, was sprawling, open-mouthed, on the divan, and snoring abominably. He dreamed that he was walking peacefully along the Pangbourne road, when suddenly a ruffian sprang out from the hedge and seized him by the collar, shaking him violently and kicking his shins. It was an unprovoked attack, and he was naturally very indignant, and he expressed that indignation in very pointed terms.

He awoke to consciousness to find that it was Adolphus who was shaking him and kicking his shins. Instantly the horror of the position brought him, wide awake, to the full possession of his faculties. Had they heard what he said?

He caught the eye of Lady Bamfield. He thought that she looked at him reproachfully. Evidently, he reasoned, they had heard what he said. And then 'Uggins was filled with panic.

The divan was at the far end of the hall, only a few feet from the door. 'Uggins made for the door, and, before Adolphus could follow him, he had rushed into the darkness, and was tearing blindly across a ploughed field. He ran as long as his wind lasted, and then crouched under a hedge in fear of pursuit. But Adolphus must have missed his tracks, for in half-an-hour there was no sound but his own breathing. Later he found a road, and walked several miles until he came to a town whose name he did not know. Here he waited for the early morning train to London.

He had decided that he would end it all then. He had quite determined to end it. Only his arrival at Paddington at seven in the morning in muddy evening-dress, without coat or hat, rendered it impossible for him to return to his old haunts. He would have to go to the house in Park Lane to secure a lounge suit.

Here he met Adolphus, who had motored home, knowing that 'Uggins would be bound to

return precisely as he did return.

'I've 'ad enough o' it,' he announced defiantly.
'My dear 'Uggins,' replied Adolphus calmly,
'in twelve days' time the fish-shop will be
yours. If you throw it up now you will receive
nothing.'

'I don' care. I tell yer I've 'ad enough o' it.'
Adolphus renewed his arguments when 'Uggins

had changed.

- 'You needn't worry yourself about what happened last night, you know,' he said. 'Without wishing to hurt your feelings, 'Uggins, they didn't think'——
- 'Oh, I know wot they thort, right enough,' interrupted 'Uggins. 'They bin' enjoyin' their-selves, your friends 'ave—ever since I took this on. Thort I was very hinterestin', they did! 'Eard one of 'em say so! But it ain't them that matters. It's 'er!'

'Who?' demanded Adolphus, in surprise.

'Why, 'er—Lady Bamfield. She—she'd took a fency to me.' Adolphus kept a perfectly straight face as 'Uggins continued. 'P'r'aps you didn't see it. Fack remines! When I was abaht she didn' seem to tike no notice o' them others. Them bein' in 'er house an' all! We was gettin' on fine! Nothing wrong, mind jer! An' then I go an' make a blawsted 'og o' meself—in 'er 'ouse! Well, I ain't goin' to chaunce seein' 'er again arter thet—not for all the bloomin' fishshops in Lunnun! I'm done. Thet's all! I give up! Good-day, guv'nor.'

'Here, I say, 'Uggins! Wait a minute!'

Adolphus heard the front-door slammed, and knew that 'Uggins had gone. For a couple of hours he struggled with the awkward thought that he was a cad. Then he went round to Lord Riverstone's rooms.

'Riverstone,' he said, 'you have won. He bolted this morning. That confounded book was right after all. I've brought your cheque.'

right after all. I've brought your cheque.'
'By the way,' said Lord Riverstone as he took the cheque, 'you were entitled to offer him a substantial reward if he stood out for the three months. Did you?'

'Yes. He seemed to want a fried-fish shop more than anything else in the world. So I promised him that. But he was to receive nothing if he failed to stick it out. I intended to give him something, of course, but the begger bolted.'

Lord Riverstone fingered the cheque for five hundred pounds. 'I suppose I shall be able to dig him out,' he said half to himself.

THE END.

EDUCATION IN FOOD VALUES.

AN important and far-reaching method of public education is that exercised through the Department of Agriculture at Washington, by means of which the United States Government has achieved fame and extended usefulness for the comprehensive character of its advice. Its official pamphlets cover many varied fields of human activity, and are full of useful advice by leading specialists for the benefit of one and all. Probably no official handbooks have achieved such a widespread popularity and success as those dealing with cookery. These guides to household economy have been printed in millions, nearly three million copies of that dealing with the Economical Use of Meat in the Home having been distributed. Another bulletin, of which over half-a-million were circulated, deals with breadmaking; while another one treating of cheese has found nearly half-a-million readers. As these may be had for only a few pence each, it is not surprising that the American housewives, in the eternal struggle to keep expenses down and to increase efficiency, make use of the knowledge disseminated by their paternal Government.

No country, we are told, has a greater variety of readily accessible foods of good quality than the United States, and in none is there a more general use of a wide range of articles. The acknowledged energy and achievement, the general health, and the physical well-being of Americans are said to show that in the main they have used food advantageously. This in spite of the quick-lunch method of bolting food, which cannot be commended.

An ideal diet is described as that combination of foods which, while imposing the least burden on the body, supplies it with exactly sufficient material to meet its needs. The pamphlets referred to are based on a wide field of experiment in food values to help toward this ideal dietary. The printed index and price-list of documents arranged under subject headings provide easy reference to what may be wanted.

The principal contributor to these public documents relating to health and hygiene is Dr Charles F. Langworthy, who has been chief nutrition investigator for the United States Department of Agriculture since 1905. He has also been a contributor to encyclopædias on his own subjects, and has written in conjunction with other specialists a Digest of Metabolic Experiments and Occurrence of Albumen. Miss Helen W. Atwater, in summing up her teaching on Bread and Breadmaking, says that, as compared with most meats and vegetables, bread gives practically no waste, and is very completely digested; though it is always too poor in protein to be fittingly used as the sole article of diet; but when eaten with due quantities of other food it is invaluable, and well deserves the title of 'the staff of life.' As far as is known, for a given amount of money, white flour yields the greatest actual nourishment, while the various food ingredients are in good proportion. Digestibility appears to depend largely on the lightness of the loaf, and more indigestion has been caused by heavy, badly raised bread than by badly cooked food. Regarding wheat-flour which contains a large part of bran, it is not certain that the extra amount of mineral matter is of the same value as that in the interior portion of the grain. Dr Rabagliati, in his Air, Food, and Exercise (which is a British book), sounds a note of warning as to overeating bread-stuffs, and is inclined to trace some serious ailments to bread forming the staple food.

Dr Langworthy and Miss Hunt, in Economical Use of Meat in the Home, say that from the earliest times man has used animal foods, and his whole bodily structure is adapted to the use of such articles of diet. Though some people, for various reasons, do not favour the eating of flesh, the consensus of opinion among physiologists is that this widespread habit is the result of experience, and that it has its foundation in bodily Meat is in general one of the most digestible food materials, and recent experiments indicate that all kinds are thoroughly digested, the less expensive cuts as well as the more costly. Meat constitutes one of the most expensive items in the family food-bill, and furnishes about 16 per cent. of the total food consumed in an ordinary American family. Moderation in its use is recommended for those who lead sedentary lives. The same contributors write on Mutton and its Value in the Diet, from which we gather that the flesh of the sheep does not hold quite the same place in public estimation in the United States as with us, and that there is no reason why it should not be more generally used. Lamb is always appreciated, however. As far as nutrition value is concerned, it is usually classed with beef, having nearly the same composition. amount of waste is about 20 per cent. in both; and the percentage of protein in the edible portion is practically the same—18 per cent. in beef and 16 per cent. in mutton. In the experiments recorded, mutton, like beef, was almost entirely assimilated. The characteristic flavour of mutton is commonly said to have its origin in the fat. Meats, as a whole, rank as very digestible foods, 97 per cent. of the meat protein and 95 per cent. of the fat being retained in the body, while 87 per cent. of the energy of the meat is available for bodily uses.

In the pamphlet on Eggs and their Uses as Food, also by Dr Langworthy, eggs are characterised as nutritious food, containing more water than cheese, and being more concentrated than milk or oysters, so that the instinct of mankind in using them as diet in the same way as other animal

foods, for their nutritive value, is justified by experiment. Eggs consist chiefly of two nutrients, protein and fat, in addition to water and mineral matter. Carbohydrates are present in small amounts. In composition, eggs of all sorts resemble such other animal foods as meat, milk, and cheese more than vegetable foods like flour and potatoes. The flavour is influenced by the food of the hens. Fresh eggs have the finest flavour, and, as we all know, they deteriorate with keeping. In experiments made, hard-boiled and fried eggs required three and a half hours for digestion, soft-boiled eggs three hours, roasted eggs two and a quarter, raw eggs two hours, and raw whipped eggs one and a half hours. Eggs at one shilling a dozen are cheaper than beefsteak for a family. In Cheese and its Economical Uses, Dr Langworthy says that, either raw or carefully cooked, cheese is as thoroughly digested as other staple foods, and is not likely to produce physiological disturbance. An ounce of cheese is, roughly, equivalent to one egg, to a glass of milk, or to two ounces of meat. Suggestions are given as to how cheese may be introduced into bills of fare in many ways, for the making of menus with cheese as a central dish is less understood than the usual food combinations. Judged by digestibility and wholesomeness, it is a nutritious and economic food. In Poultry as Food, Miss Atwater says that, on the average, poultry is somewhat more easily digested than beef or mutton. Dr Langworthy, in Fish as Food, points out that it is essentially a nitrogenous food, and the only considerable difference between it and meat is in the flesh of fish having water where meat has fat. Experiment shows that fish is more rapidly digested than meat. One investigator includes white fish, in respect of rapidity of digestion, in the same class as roast chicken and pigeon, roast-veal, and cold underdone roast-beef. Salt fish is less thoroughly digested than fresh. There is no scientific foundation for the widespread notion that fish contains a larger amount of phosphorus than other foods, and no evidence that it is better for the nourishment of the brain. It is commended, however, as a desirable food for persons of sedentary habits.

There are many interesting points mentioned in various other pamphlets. Of the five cereals most commonly used for breakfast foods, oats contain the largest quantity of important nutrients. Intelligently used, fruits are commended as a valuable part of a well-balanced diet, and may well be eaten in larger quantities than at But what of their price in Great present. Britain? The best fruits are seldom cheap. Of nuts, which are a very concentrated food, it is recommended that it is wiser to use them as part of a regular diet than as a condiment or supplement to another meal. The value of green peas and other vegetables is duly set forth. Onesixth of the total food of an average family is said to be furnished by milk and its products. In a study of the cost of living in American towns, the average retail prices are stated to be 38 per cent. higher than in Great Britain, the dietary of workmen in the United States being more liberal and varied than of those in the United Kingdom. Such a series of pamphlets would be extremely serviceable if adapted for use in Great Britain.

THE MONTH: SCIENCE AND ARTS.

A COMBINED SHAVING AND MASSAGE BRUSH.

THE operation of shaving is an easier task and has a better result if lathering is done properly, especially in the case of a stiff growth. The usual method of softening the hair is to rub in the lather with the fingers; but this is merely a makeshift. An ingenious brush has recently been placed on the market which not only facilitates lathering, but also enables a very clean shave to be obtained. Attached to the brush by means of a swivelling arm is a rubber disc provided with thick bristles or fingers. The lather is applied with the brush, the attachment being turned down out of the way; then the disc of fingers is moved upon its swivel and brought alongside the end of the brush, and the lathering continued. Owing to the thin rubber fingers having a taper and being short, the lather is worked down between the hairs, and thereby softens them close to the skin, where the razor takes effect. Consequently, when the razor is applied the hairs are removed completely and without the slightest discomfort. Upon the completion of the shave a health-giving massage can be given to the face with the softening attachment, the rubbing being continued until the skin glows and tingles. If a massage cream is used the effect is very considerably enhanced. It is a novel brush, and cannot fail to be appreciated, since effective softening of the hair is the secret of easy, painless, and perfect shaving. Furthermore, it is a more hygienic method than that generally adopted.

ELIANITE, AN ACID-PROOF MATERIAL.

Electricity is responsible for the commercialisation of many useful products, such as calcium carbide, carborundum, aluminium, &c. According to report, it is responsible for another material which should prove of value in certain industries. This substance, which has been named elianite, is a product of the electric furnace, and its important property is its resistance to the action of acids. It is about 50 per cent. harder than cast-iron, has a very high melting-

point, is readily cast, and is said to be a firstclass material for the construction of apparatus and vessels of large size required in the manufacture of acids. It should enable many processes in the acid industries to be carried out with commercial advantage which hitherto have been impossible owing to the absence of a suitable material.

THE 'VINERIE' SYSTEM OF WINE-MAKING.

This system, one of the many recent developments in the manufacture of wine, has made great advance, and formed the subject of an important paper read before a meeting of the Australasian Association for the Advancement of Science. It may be described as a process for wine-making which is not unlike that of brewing; that is to say, the raw material may be harvested rapidly, but the production of the wine can be deferred and carried out with more deliberation. This is achieved by sterilising the grapes as soon as they are gathered and crushed, fermentation being arrested by treatment with sulphurous acid. In this condition the grapes may be stored as long as desired, the sulphurous acid being removed by desulphiting under suitable conditions, the process being accomplished in a column and in a way somewhat similar to rectification in a still, whereby the bubbling of air through the liquid under reduced pressure, and at a temperature of about 158 degrees Fahrenheit, removes practically the whole of the sulphurous acid. The process has no illeffect on the wine—in fact, it has many advantages; while the cost of handling is considerably reduced.

ROLLER-SKATES IN THE UNITED STATES POSTAL SERVICE.

Roller-skating is generally regarded as a pastime; but the United States Government has found it very useful in the postal service. In one of the large post-offices in Chicago the postmen store their uniforms, bags, and other requisites in the basement. There are fourteen hundred lockers in an apartment measuring three hundred feet in length. It was found that checking the equipments during the rush hours imposed a severe task on the clerks. In order to facilitate the work the chief of the department suggested that the clerks should use roller-skates, so that they could traverse the floor quickly and with less fatigue. The employes soon came to appreciate the innovation, as it also effected a welcome reduction in the wear and tear of boot-leather. The experiment proved a complete success, because the clerks equipped with the skates performed their checking duties in a quarter of the time formerly occupied. Rollerskates were next supplied to those who have to carry parcels in the sorting departments, and there again a great saving in time and effort is observed. The authorities are now considering the propriety of introducing the skates into other departments of the service.

DID THE PHŒNICIANS DISCOVER AMERICA?

The problem of the original discovery of America has been carried farther back than to the Scandinavian rovers who left traces of visits to that great continent. In a sojourn among the Pacific islands that stretch from the coast of California to the shores of New Zealand, the attention of Mr Thomas Crawford Johnston of San Francisco was drawn to evidences there of what he believed to be early civilisations of the eastern Mediterranean. He made a communication to the Geographical Society of California on the subject. In continuing his researches he studied the remains which the Phœnicians have left in other parts of the world-on the shores of the Levant, of Spain, and of Britain. The result he has gathered into a very interesting volume, Did the Phænicians Discover America? (Nisbet & Co.). The author attempts to show how legendary lore often contains a kernel of historic fact. He accounts for the regular absence for three years of the ships of Hiram and Solomon, and suggests that the Phœnicians discovered the western coast of America, and that the Land of Ophir may have been in these latitudes. He notes the Greek and Phœnician names transmitted to the islands of the Pacific. His conclusions in the chapter on America are that it was discovered by the Jews and Phœnicians, and that communication so established continued throughout a period of probably three hundred years. A list is given of some of the apparent correspondences between the people of the eastern Mediterranean and those of Central America. The illustrations show an Aztec calendar or water-stone and a chart of probable Phœnician travel to Central and South America.

AN ELECTRIC CLOTH-CUTTING MACHINE.

In establishments engaged in the manufacture of uniforms and other clothing on a large scale electricity is rapidly coming into use for several operations, especially cutting. A cutting-machine which has been introduced recently is compact and easy to handle. The current is derived through an adapter and flexible connection with an ordinary lamp fitting, the consumption being about the same as that of a thirty-two candlepower lamp. The cutter is made in two forms: one for several thicknesses of cloth superimposed, as when several suits of the same size are to be cut; the other for use when the roll of cloth, of single thickness, upon which the patterns are marked out, is extended upon a long table. The machine for cutting several thicknesses of cloth is provided with a moving vertical knife capable of cutting through layers up to six inches in thickness; the other, for cutting a single thickness, has a rotary disc cutter. The machine is simple and easy to manipulate; it is held and

guided by a handle, the switch being so placed that a movement of the thumb will start or stop the mechanism. The machine is also fitted with a lamp which throws a strong focussed light upon the cutting-line, so that the marks may be followed accurately and with facility. In both machines the cutting-blades are guarded against accident or injury. Sufficient lengths of flexible wire are provided to enable the operator to manipulate his cutter through a considerable radius, so that a long length of cloth uncoiled upon a bench may be cut as easily as several thicknesses superimposed and in one place, where little movement is required.

SKY-SCRAPERS AND TRAMWAY TRAFFIC.

Do tall commercial buildings affect tramway traffic? At first sight such an inquiry may appear somewhat trifling; but the writer has been assured by an eminent American traffic authority that they influence street transporta-tion adversely, and to a far greater degree than is generally believed. In American cities, where lofty buildings of sixteen floors and upwards line the streets, each pile probably houses several hundred persons. If there are, say, ten of such buildings placed side by side, as many people are accommodated therein as would be required by nearly twenty-seven six-floor buildings similarly placed. In the latter event the street frontage, from one end of the range to the other, would be considerable—nearly three times as long as that of the group of sky-scrapers. Consequently, when intercommunication occurred, use would be made of a passing tramcar or omnibus to save the journey of perhaps half a mile. But in the case of the sky-scrapers, intercommunication does not involve a walk of more than three hundred and fifty yards at the utmost-certainly not a sufficient distance to require a public vehicle. As intercommunication between these sky-scrapers is continuous throughout the day, it will be seen that there is a very great loss to the tramcars. It is computed that if eight floors above street-level were made the maximum in New York, and if all the sky-scrapers in the city were reduced to this level and placed in a single street, a journey of about three miles would have to be made to pass from the first to the last building. As a friend of the writer tersely put it, 'Instead of spending money travelling in a horizontal direction, American business people travel up and down.' The significance of this statement is realised on a visit to the Woolworth, Singer, and other buildings, where the array of lifts in ceaseless operation, running upon schedules like those of the railways, emphasises the immense amount of local traffic there is in a sky-scraper.

PORCELAIN HOUSES.

The porcelain house is the latest development in domestic architecture and construction. There

is much to be said in its favour, provided the cost is so adjusted that it compares satisfactorily with the expenditure incurred on a house of similar size built of the usual materials. Porcelain is non-hygroscopic, is germproof, offers no refuge to insect life, and is fireproof; so that the porcelain house possesses all the essentials necessary in a hygienic dwelling. A wall of porcelain one inch thick is more effective for keeping out the cold in winter and the heat in summer than a brick wall of eighteen inches. In principle its erection is also somewhat different. The framework is a skeleton of rust-proof metal; and the porcelain slabs measure six feet in length by three feet in width, with a weight of about five pounds per square foot. Being glazed on both sides, the porcelain slabs are completely weather-proof; and if desired the inside walls may be decorated in any design, which is burnt in beneath the glaze, and therefore permanent. The walls, ceiling, and floor may be washed with a leather or cleansed with a hose. The windows and doors are hung upon the metallic framework; and, as wood is not employed in any form, a draught-proof fit is obtained. The joints are made of coppercoated asbestos tape, as are all openings for chimneys, &c. The work of erection is simple, with only a screwdriver and a spanner as tools, all the parts being screwed or bolted together. Such a house can be erected in a very few hours by unskilled labour, and should be in great demand in the Colonies and tropical climes. For isolation hospitals and similar institutions porcelain is an ideal material, owing to the facility with which perfect cleansing may be carried out.

COLOUR-MATCHING BY ARTIFICIAL LIGHT.

The matching of colours by artificial light probably constitutes one of the most difficult operations in the textile industries. In fact, in many instances it is an impossible task, especially with delicate art shades. A German firm has now perfected an electric arc lamp whereby colour-matching may be done and constant colour values given as accurately as by daylight. The difficulty with any form of artificial lighting is the production of a spectrum similar to that of daylight. In this latest device the lamp, which is of the flame-arc pattern, is fitted with a filter formed of glass strips of different colours, so arranged that a mosaic effect is produced. By this means the light emitted from the burning carbons is broken up into small beams of different tints. These are then passed through a translucent screen, whereby they are blended and diffused in such a manner that the light thus obtained corresponds very closely to the daylight spectrum. The lamp is as useful for shop-window lighting as for matching and comparing colours, because the filter can be so adjusted as to enhance the colour values of the goods displayed.

AN INNOVATION IN CURTAIN MANUFACTURE.

Dressing the windows is probably one of the items of domestic life in which the lady of the house manifests the greatest pride. A welldressed window is an index to a well-kept house. Curtains, however, have undergone very slight changes in recent years. The edges are still scalloped, and the design is continued right up But the preservation of the to the border. symmetry of the edges is a constant difficulty; they invariably become distorted in cleaning, with the result that the pattern is thrown awry. Moreover, the scalloped edge probably constitutes the most vulnerable part of a curtain. Recently one of the foremost Nottinghamshire firms has introduced an innovation which will have the housewife's approval. This is a straight hem border varying in width according to the design of the article. The edge, being turned over and hemmed, is very strong and quite straight, which is a decided novelty, and tends to throw the pattern into greater relief, forming a kind of frame to the design. Apart from its artistic advantages, it renders the curtain much stronger; while in the cleaning of the curtain it assists very materially in the stretching whereby the curtain is extended to its designed length and width, so that there is less difficulty in bringing the pattern into line. The improvement is protected by patent.

THE WORLD'S LONGEST STEEL-ARCH BRIDGE.

An engineering work of considerable magnitude is being completed in the United States. This is the Hell Gate Bridge, which is being thrown across the East River between Long and Wards Islands to provide the New York, New Haven, and Hartford Railroad with a connection with the Pennsylvania Railroad in New York City. The structure will have a span of one thousand and seventeen feet between towers; in the centre there will be a clearance of one hundred and thirty-five feet above high water, the depth of the crown being forty feet. arch rises in a graceful curve. Some nine thousand tons of steel will be used in its construction. When completed, the bridge will be the longest single-span steel structure in the world, and will carry four lines of road.

SIR JAMES CRICHTON-BROWNE AND BABY CLOTHING.

The all-round training of girls, the future mothers of the race, for their prospective home duties is a matter of national importance. The loss in respect of infant mortality through ignorance or neglect, the waste by unhygienic methods and bad cookery, which bring ill-health and unhappiness in their train, are quite incalculable, but only too self-evident. There is no lack of helps and instructors in domestic subjects for the rising generation. To name one, Miss Wilena

Hitching, Organiser and Inspector of Home Management to the Derbyshire County Council, is author of a very useful book on Home Management which has met with wide approval. later book by Miss Hitching is on Baby Clothing, to which Sir James Crichton-Browne has written a foreword. His remarks on the book are both interesting and instructive. He says that 'Miss Wilena Hitching has done an exceedingly useful work in preparing a treatise on Baby Clothing, and in showing how the human infant may be suitably and economically encased. The garments she has designed of wool, flannel, or wincey secure at once necessary warmth and necessary ventilation. They exclude draughts, but promote transpiration. They afford protection to the skin without interfering with free movement of the muscles. They support, but do not constrict. They are sufficiently dressy and artistic to satisfy the proud mother's soul, and sufficiently cheap to accommodate themselves to her purse, even when that is very shallow. Miss Hitching starts with the cradle, and swathes the nursling in vestments admirably adapted to its primitive requirements. Nor does she stop there, but provides for the next stage; for her "longs" are capable of being converted into "shorts," at a great saving of trouble and expense. She makes the baby thoroughly comfortable, and does not constrain any of its functional activities, and thus leaves ample room for the growth of both body and mind. She shows how the knitting-needle and the crochet-needle may be manipulated in the production of the genuinely hygienic little wardrobe she suggests. Those who have had experience in children's hospitals, and have seen the strange and manifold wrappings in which babies are often brought to them-wrappings which have to be unpinned, unhooked, untied, unwound before an examination can take place—will cordially welcome Miss Hitching's simple and sensible coverings, which all fasten in front. This little book, with its clearly intelligible illustrations, should be a boon to mother and child alike in many a home.'

To Correspondents who wish fuller information regarding new inventions mentioned here, addresses will be furnished, when possible, provided a stamped and addressed envelope or post-card be sent to the Editor, 339 High Street, Edinburgh.

. TO CONTRIBUTORS.

- 1st. All communications should be addressed 'To the Editor, 339 High Street, Edinburgh.'
- 2nd. For its return in case of ineligibility, postage-stamps should accompany every manuscript.
- 3rd. To secure their safe return if ineligible, ALL MANU-SCRIPTS, whether accompanied by a letter of advice or otherwise, should have the writer's Name and Address written upon them IN FULL.
- 4th. Poetical contributions should invariably be accompanied by a stamped and directed envelope.

MISS PETERSEN TAKES CHARGE.

A TALE OF THE THAMES.

By George Frederick Cotton.

CHAPTER I.

MISS PETERSEN sat at one end of the breakfast-table; old Petersen sat at the other. From old Petersen's lowering brow and Miss Petersen's complete air of detachment, it would have been evident even to a deaf man that a lecture was in progress; and it is also certain which would have claimed the deaf man's sympathy, for it was obvious that not from her father did Miss Petersen inherit her rosebud mouth and dimpled chin, and the wealth of sunny chestnut hair that rioted over the merriest face in Lewisham.

Old Petersen paused to take breath. Then he drew his bushy eyebrows down over his small, keen eyes, snorted once or twice, and resumed: 'That's about all, miss. You've 'ad your warnin', and that ought to be enough. I'm not agoin' to see my pretty darter, with all the eddication and accomplishments which I've paid for, thrown away on any common tug-master, 'owever much of a fine gentleman 'e may think 'imself. No, miss.'

Old Petersen stopped, pulled out a big red bandana handkerchief, and blew his nose loudly.

Miss Petersen, apparently withdrawing her thoughts from a great distance, looked at him, and broke suddenly into a little rippling laugh. 'Another cup of tea, dad, before you go?'

Old Petersen got up hurriedly. 'No,' he grunted. 'I've got a busy day afore me, and'—he shot a quick glance at his daughter—'I'm a-thinkin' of runnin' over to Hamburg for the week-end.'

Miss Petersen looked quite unconcerned. 'Then you'll be a bit late to-night, dad,' she said cheerfully.

'Mebbe—mebbe. Where's the Combers' rentbook?'

'All ready on the hall table, with Rigg's letter, the Deptford statement, and your gloves. Am I not a perfect private secretary?'

Old Petersen's rugged face relaxed in a little smile of pride. 'Humph! you're not a bad girl—so far,' he admitted somewhat grudgingly.

'How could I be, with such a dear old dad?' said Miss Petersen, holding up her tempting lips for a good-bye kiss.

No. 175.—Vol. IV.

She watched him stump solidly down the broad stone steps, and then turned to her flowers, with a little meditative smile flickering across her sunny face.

'He is a dear old dad,' she said to herself; 'but I always get my own way, and I mean to this time. He thought I should blush or something when he spoke of running over to Hamburg—of course with Jack—but not I. And although Jack is only skipper of his pet tug, dad's awfully fond of him, all the same—and so am I—heigho!'

From which it will be seen that those folk were right who said that if Molly Petersen had all her mother's good looks, and more, she inherited one thing from her father in full—his obstinate temper.

Samuel Petersen, Esquire, owner of much property and many barges, spent, as he anticipated, a busy day. Saturday being pay-day in one business, he made Friday rent-day in the other; and as he made a point of collecting most of his rents himself, it was usually with slow steps and a heavy bag that he finally reached his office in Great River Street.

The rents of Friday he locked away in a special safe of his own devising, and the amount of cash in that safe was often of considerable proportions, for old Petersen had much faith in his own invention, and little in other people's credit, and was a little bit of a miser into the bargain.

On this particular Friday sundry would-be defaulters made his round take longer than usual, and seven o'clock was striking on the clock of St Anselm's when he came slowly round the corner and halted opposite the place, half-shop, half-office, which bore his name.

In the gathering dusk the office was dark and empty, for the clerks had all gone home. Only a light glimmering in the basement showed where the caretaker was having his evening meal. The lamps in the street shone upon a thoroughfare silent and deserted, for to all except old Petersen the long day's work was done.

Old Petersen, however, was unconscious of all these things. To him work was recreation, and his only recreation was more work. It is true he

[All Rights Reserved.]

APRIL 4, 1914.

often ran over to the Continent in his favourite tug; but it is questionable whether these trips did not involve more work than pleasure, for Samuel Petersen had considerable interests in Hamburg and its neighbourhood.

His mind was running on one such forthcoming journey as he halted before his dark and sombre office, fumbling for his key. A few seconds later the door had swung to behind him, and the street was more silent and deserted than ever.

John Stranger, known to some as B.Sc. of London University, and author of a most illuminative work on the application of gas-explosive engines to marine purposes, known to others as skipper of the screw-tug Coronation at thirty shillings a week, received the telegram about half-past eight. He left his Thurston's Dynamics and his mutton-chop, opened the buff cover, and growled 'No answer' somewhat irritably as he read the contents:

'Meet midnight train, Tilbury.—Petersen.'

'Confound him! and I was counting on a free Sunday,' said Stranger, as he hastily adjusted a pair of trouser-clips, and glanced across the room at the uncertain back-tire of his well-worn bicycle.

A quarter of an hour later he was standing in a small boat just above the Victualling Yard at Deptford, holding a hasty conference with the *Coronation's* engineer, who usually slept on board. And about nine he and his bicycle were in the lane at the back of The Laurels, Lewisham; from whence, after sundry hootings of a mysterious owl, daintily tripped Miss Molly Petersen.

'Jack!' she exclaimed reproachfully. 'And I told you not to come except when'——

'I know,' said Jack; 'but, look here, isn't it too bad, just as we had schemed Sunday afternoon so nicely?'

Molly Petersen took the telegram and bent down to read it by the light of the bicycle-lamp. Jack seized the opportunity to take what Molly described as a mean advantage.

'I couldn't help it,' protested Jack. 'It will take a lot to make up for that lost Sunday.'

'He said something this morning about going,' mused Molly. 'But I didn't think he meant so soon. I suppose this means he won't be coming home. What time was the telegram sent?'

Both heads bent down together.

'Jack!' exclaimed Molly.

'Ten minutes to eight,' said Jack.

'Why didn't he send me one at the same time? He usually does,' said Molly thoughtfully.

'I expect he sent this in a hurry, in order to.

give me time,' said Jack.

'Y-e-s,' said Molly slowly. Then she shook herself free of her thoughts, and put her hand

on John Stranger's arm. 'What am I thinking about, to keep you here like this?' she said briskly. 'Please go; but I wish I were coming too.'

'So do I,' said John Stranger mournfully.

Molly Petersen watched the bicycle and its rider until the red side-light disappeared round the end of the lane; then she entered the garden-gate and walked slowly and thoughtfully toward the house.

At the casement window a maid appeared, with cap awry and a white, scared face. 'Oh miss! miss!' she cried stupidly, wringing her hands.

'What is it?' said Molly sharply, with sudden apprehension.

'Oh miss! the master!'

Molly Petersen pushed the girl aside and rushed into the house. The front-door was open. Through it came a confused murmur of gruff voices, and she could see the figures of several men stepping slowly, with a curious harmony of movement.

Molly Petersen stopped short with a little, gasping cry. Her sight grew blurred, she swayed from side to side, and everything nearly faded into blackness around her—nearly, but not quite. With a great effort of will she kept herself from fainting, and moved on toward the door.

"E wouldn't go to the 'orspitle, miss. 'E was bent on bein' took 'ome. So we puts 'im in a cab and brings 'im, pore old chap!'

Molly stood, still half-dazed, while the mournful procession moved slowly up the wide stairs toward old Petersen's room.

'I've sent for the doctor, Miss Molly. He'll be here directly,' said a quiet voice at her elbow.

Molly realised that it was the cook, a capable motherly person, who had been in the family for many years. The girl turned to her now with eager thankfulness. 'Oh cook, what is it? What has happened?'

'The police found him, miss, about half-past seven, in the office. It had been turned upside-down, and he was lying stunned in a corner. When they brought him to, nothing would do for him but to come home. He's had a nasty blow on the head. But don't you worry, miss. He's fainted again, but he'll be all right, never fear. It's the shock more than anything; and, though he's an old man, he's got a lot more in him than many young ones.'

The blow on the head was somewhat ghastly to look at; but Molly, assisted by the cook, bathed it with firm, steady hands. Now that she had something to do she was herself again. A noise outside the door made her look up.

'Dr Larkin, miss,' whispered the cook.

The doctor came in, brisk and matter-of-fact. In a few words Molly told him what had happened. He nodded and moved over to the bed.

'Nothing to be alarmed about,' he said, as he wiped his hands after he had finished. 'Much more pleasant to put in the stitches while he is unconscious. He'll come round directly, though. Keep him quiet and his mind easy, and he'll be all right. Good-night.'

Old Petersen came round very soon after the doctor had gone. At first he looked about him wildly, and struggled to rise. Then he caught sight of Molly's anxious little face, and he sank

back with a sigh of relief.

'It's all right, daddy dear,' said Molly tremulously. 'Don't think about anything. I'll take

charge.

Old Petersen lay back quietly with closed eyes. Presently he spoke in low tones, but quite clearly. 'Ay, take charge, my girl. See John, and take charge.'

See John! Molly started. She had forgotten John. And John was to have met her father at Tilbury that night! Then, in a sudden flash of memory, came the recollection of the time at which John Stranger's telegram was despatched—just before eight—and the time when old Petersen was found by the police.

Molly's heart beat fast with excitement, and the hot blood rushed to her face. Her father could not possibly have sent the wire. What could it mean? But perhaps her ears had played

her false. She walked softly across to the cook, who was still in the room. 'What time did you say father was found?'

'Half-past seven, miss.'

'Are you sure that was the time?'

'Yes, miss. I thought it was strange they were such a long time bringing him home, so I asked again. They said it was some time before they got him round, and then they couldn't get a cab.'

Molly was convinced, and with conviction came the knowledge that she must act, and act promptly. The police? No, they would not move quickly enough; and John Stranger must be stopped somehow before he got to Tilbury. There was only one thing to do, and Molly promptly decided to do it. She went up to the prostrate figure on the bed. 'Dad, I'm going to see John, and take charge. Cook will take care of you while I'm gone. Good-bye, dear.'

The old man nodded, seemingly quite content.

Molly bent down and kissed him, and went softly from the room. In a few words she explained to the cook that she must go out, and might be gone some time. 'I leave everything entirely in your hands, cook,' she said. The cook nodded. If she felt any surprise, she showed none.

(Continued on page 296.)

FRONTIERS AND FRONTIER-MARKING.

By A. HILLIARD ATTERIDGE.

IN the lands of the Balkan Peninsula diplomatists and experts in military topography are busy just now with a series of complex frontier questions. The revised boundaries of half-a-dozen old-established states and the limits of the new principality of Albania are being settled, as the result of a twelvemonth of sanguinary fighting. On our maps frontier lines are marked out with a helpful diversity of colouring; but those of Europe have all been marked in red in the course of centuries—for which of them has not been defined at the cost of blood?

The untravelled Briton, happy in the possession of the only really 'natural' frontier—the sea—hardly knows what a Continental frontier looks like. Even when he makes a summer tour abroad, if he travels by railway he seldom notices the actual border-line. All he sees is the frontier station, which may be some miles inside the actual boundary. Thus the traveller from Ostend to Cologne and the Rhineland only realises that he has left Belgium for Germany when the train stops at Herbesthal station, and he sees German uniforms on the platform, and has to explain to Customs officials that he has 'nothing to declare,' and puts his watch back an hour to adjust it to 'mid-European time.' If you want to see the actual frontier you must not travel by train.

Then there are places where you can change the Government under which you live more than once in an hour's walk, as you traverse the windings of an irregular frontier line, and can stand with the right foot in a different country from the left. A few miles west of Metz, on the slopes that saw the hard fighting of the battle of Gravelotte in August 1870, the frontier that divides the French Republic from the German Empire wriggles in a broken line across the unfenced fields. I suppose that what we would call parish boundaries determined its actual outline. It is marked visibly here and there by posts. In a walk of a couple of miles one crosses and recrosses it. On the way one meets here and there a French or German Customs guard, with short carbine carried under the arm or pistol on belt. They are very good friends. One may even find the Frenchman and the German having a quiet chat, one of them for the time being out of his own territory. For they help each other in counterplots against the wiles of the smugglers.

On the verge of the long plateau that looks down on the border-line there is a grim record of the cost of marking it out, for there are the huge green mounds that are the graves of thousands of the soldier dead. Go up the slope and pass along a field-path between the mounds, and

you are in a village that was officially known as Amanvillers before 1870, and is Amanweiler now. But, despite its German name, the villagers mostly speak French. Political boundaries and those of race and language do not always coincide.

One of the national songs of Germany proclaims that the bounds of the German Fatherland are those of the German speech. Such a rule applied to the German Empire would cut out Posen and Metz, and take in big slices of Austria and Switzerland. The language rule is not observed in practice. Neither is the geographical rule—the theory of 'natural boundaries'—a guiding principle in frontier-marking. It is a theory held by many as an ideal, and it has cost much bloodshed. French schoolboys are still taught as part of their geographical training that the 'natural boundaries' of France are the Channel and the Atlantic, the Pyrenees, the Mediterranean, the Alps, and the Rhine. When they come to read history they learn how much this idea of a natural right to the west bank of the Rhine has cost their country.

The same idea of 'natural frontiers' prevails to some extent in the United States. The newer interpretation of the Monroe Doctrine is almost an assumption of it. Half-jocularly and half-seriously a prominent American politician once declared that the boundaries of the United States were the ocean to east and west, northward the Aurora Borealis, and southward 'eternal

destiny.'

The greater part of the United States frontier between the Republic and Canada—namely, all of it that lies west of the Great Lakes-is marked on the map by a straight line. A similar line marks the division between the United States and Mexico west of the upper Rio Grande. These lines are parallels of latitude very easy to draw on a map when statesmen meet at a conference round a green baize table, but not so easy to mark out on the ground. Some years ago the dividing-line between British Columbia and Oregon was marked for many miles by felling a lane of trees through the pine-woods. On the open prairies lines of posts define the boundary. These posts, a mile apart, were set up some fifty years ago. There are nearly a thousand of them, and they were all supposed to stand along the forty-ninth parallel of latitude. But the fixing of the precise position of hundreds of posts along a parallel of latitude means that a great number of careful and accurate astronomical observations have to be taken. Six years ago the operations of the Canadian and American Government surveys showed that here and there, over distances of many miles, the posts had been fixed too far north or too far south. The positions have been gradually rectified, with the result that, without moving their homesteads, Canadian farmers have found themselves transferred to the United States and American frontier settlers have become British citizens.

Even when a mountain-range or a river is chosen as the dividing-line, awkward questions sometimes arise when the actual marking out of the frontier is taken in hand, especially in non-European countries where comparatively rough maps are used for the first definition of the border-line. On the map the ridge of the mountain-chain and the course of the river seem definite enough lines. On the actual ground it is very different. The mountain-chain proves, it may be, to be a mass of parallel ranges. Which is the main ridge? Or in places it is a wide plateau, into which the torrents have cut ravines and valleys that wriggle about in a way that is the despair of the surveyor. Where is the main line of the water-parting? On the upper course of the rivers, which of the many branches is the main stream? On the lower course there are puzzling places where the river divides, to unite again lower down. Which of the branches is the frontier stream? Whose is the land between the river-arms? Worst of all, in many tropical lands, with rivers fed by tor-rential rains and often in flood, the river itself has an awkward trick of changing its course from time to time.

Frontier-marking was carried out on a most elaborate and gigantic scale by some of the Old World empires. They were not content to mark their border-line; they fortified it along its whole length—not a very wise proceeding, for to watch every point for hundreds of miles is to be weak everywhere against a concentrated attack. But these fortified borders were mostly erected to check the inroads of barbarian tribes, and were effective so long as these were capable only of Such fortified frontiers were the isolated action. borders of the old Roman province of Britain, now marked by the vestiges of the Roman walls that once ran from the North Sea shore to the western coasts; the barrier-line that ran from the upper Rhone to the Danube; and in Far Eastern Asia the Great Wall of China and the stockade that for hundreds of miles divided Corea from Manchuria.

In more modern times there was a frontier line, not indeed fortified throughout, but marked by a chain of fortresses and watch-posts, along the border between Austro-Hungary and the Ottoman Empire. It was the dividing-line between the West and the East, guarded as jealously in time of peace as during war. For it was also an international quarantine line to protect Europe against the dreaded Oriental plague. The strict watch of the line seems to have been given up shortly before the Crimean war. Kinglake, who visited the East in 1840, tells how he entered the Ottoman dominions by crossing the Danube at Belgrade, and notes that Semlin on the Austrian and Belgrade on the Turkish side, though not a cannon-shot apart, were divided as by an abyss. They held no communication, and the traveller, as he pushed off from the

Austrian shore, was warned that he would incur the death penalty if he recrossed except under the supervision of the quarantine authorities, who would keep him prisoner at Semlin till all fear of his having brought back the plague infection with him was over.

In Europe, frontier questions only come up for settlement after a war has upset prior arrangements; but in colonial regions and newly explored countries there is a continual 'rectification of frontiers' going on, as occupation and exploration, problems of trade, railway-making, and the rest bring up this or that local question for settlement. Happily most of these questions are decided by arbitration. The first great issue of the kind arose at the close of the fifteenth century, when Spain and Portugal were rivals in discovery and conquest beyond the seas. The famous Bull of 1493, which fixed the line of demarcation between the Spanish and Portuguese empires at the meridian one hundred leagues west of the Azores, is sometimes represented as an arbitrary exercise of papal power, parcelling out the earth as the dominion of the papacy. It was really an early triumph of the principle of arbitration, the two Catholic kings appealing to the Pope as an authority that both of them respected. It is not generally known that the arrangement was afterwards revised by negotiation between the two Powers. By the Treaty of Tordesillas, Spain agreed to move the dividingline to the meridian three hundred leagues west of the Azores, with the result that Brazil was given to Portugal.

In modern times the doctrine of the 'hinterland' has been generally accepted, the state that occupies the coast of a new region having a right to the lands 'behind' it. This was the basis of much negotiation in the partition of Africa between the European Powers; and disputes arose chiefly on the question how far these 'hinterlands' extended, and where the dividing-line was to be marked between 'hinterlands' starting from opposite coasts.

In Europe a frontier is now marked not only by its lines of posts but by the establishment in its neighbourhood of fortresses, and great railway stations with long platforms that are beyond all the requirements of peace traffic and are intended only for the rapid detraining of troops when war There is a vigorous police system of watchfulness against espionage; and, besides this, a network of Customs posts to prevent smuggling. Theoretically, the frontier is a line drawn on the ground and extending skyward like an invisible wall. This quality of the frontier did not much matter till the recent development of aerial navigation. Now the frontier guards and Customs officials have an anxious time looking out for adventurous voyagers in aeroplanes and navigable balloons. These may be used for purposes of espionage and also for smuggling. Hence a multitude of new regulations as to the points at which the travellers of the air may pass a frontier, the necessity of coming to the ground for examination if challenged by signal, and the duty of being provided with passports and other papers defining the identity of the voyager and the object of his journey. Even we, with our sea frontier, have had to fall into line with the mere Continental Powers in this respect, and mark out entrance-places on our wave-girt borders for the passage in and out of aircraft.

A KNIGHT ON WHEELS.

By IAN HAY, Author of The Right Stuff, A Man's Man, Happy-go-Lucky, &c.

CHAPTER XVII.-THINGS.

THE Euston Road, which is perhaps the most funereal thoroughfare in Europe, furnishes the first glimpse of London to fully fifty per cent. of all who visit our capital.

Philip was no stranger to London, for he had spent his youth in the wilds of Hampstead; and, later on, like most young men, had formed a tolerably intimate acquaintance with that portion of the Metropolis which lies within a radius of one mile of Piccadilly Circus. Still, as his cab hurried away from the unspeakable hideousness of Euston Station, and turned into that congeries of tombstone-makers' yards and unsavoury lodging-houses which constitutes the Euston Road, even Coventry seemed pleasantly rural by comparison. Most of us are inclined to feel like this at the outset of a new undertaking. Fortunately we can support ourselves through

this period with the reflection that every success worth winning is approached by a Euston Road of some kind.

His first few weeks in the London offices were a prolongation of this journey. The young gentleman in the showroom proved to be unspeakably offensive and incompetent; the Yorkshireman in the repairing-shop was incredibly obstinate and secretive. The staff were slack, and the premises dirty. Letters were not answered promptly, and the accounts were in a shocking mess. Finally, every soul in the place—with the possible exception of the lady typist—greeted the intrusion of the new manager with undisguised hostility.

Philip, reminding himself of the period of time in which Rome was not built, set to work, in his serious methodical fashion, to master departmental details. He went through the repair-shop first, and, mindful of Mr Mable-thorpe's admonition to study People rather than Things, spent much time in studying the character of each of the men employed. As a result of his investigations, two mechanics, props of their Union, were tersely informed that unless their standard of performance was raised at least one hundred per cent. their services would not be required after the end of the current month.

Next came a brief but painful interview with Mr Murgatroyd, the Yorkshireman, upon the subject of perquisites and commissions. The motor industry lends itself to the acquirement of pickings more, perhaps, than any other trade of to-day except politics; and the long-headed Mr Murgatroyd had made good use of the opportunities thrown in his way for something like ten years. Henceforth, Philip explained to him, there must be no more clandestine douceurs from tire agents, no more strictly private rebates on consignments of petrol, and no more piling up of unconsidered trifles in customers' bills. Before undertaking a repairing contract of any magnitude, Mr Murgatroyd must present a detailed estimate of the cost, and the work was not to be put in hand until the estimate was approved and countersigned by the owner of the car.

To this Mr Murgatroyd replied almost tearfully that if Mr Meldrum proposed to run the establishment upon Sunday school lines the sooner they put up the shutters the better.

'Does that mean that you want to resign your post, Mr Murgatroyd?' asked Philip hopefully.

Mr Murgatroyd scratched his ear. 'Not at all, sir,' he said. 'I dare say we shall take a little time to get used to one another's ways, that's all; but in the end I'm sure we shall get along grandly.'

What Mr Murgatroyd meant was: 'You are a new broom. In a short time your youthful zeal for reform will have abated, and we can then slip back into the old comfortable groove. For the present I must make a show of complying with your idiotic commands.'

Philip understood this, and calculated that six months of commercial austerity would set his manager looking for a softer berth. Both sides having thus decided to wait and see, the interview terminated.

Philip next introduced his broom into the somewhat Augean garage. Car-washers were straitly informed that their duty was to wash cars and not to rifle the tool-boxes and door-pockets thereof. The current price of that fluctuating commodity, petrol, as fixed from day to day by the brigands who hold the world's supply in the hollow of their unclean hands, was chalked up in a conspicuous position every morning, in order that consumers might purchase at the market price and not at one fixed by the foreman. Sundry members of that well-organised and far-reaching Society for the Acquisition

of Other People's Property—the brotherhood of chauffeurs who used the garage—were put through a brief but drastic course of instruction in the elementary laws of meum and tuum; and one particularly enterprising member of the craft, to whose possession a new and expensive jack, recently the property of a gentleman from the country who drove his own car, was traced after a systematic and quite unexpected official inquiry, was directed to remove himself and his vehicle to other quarters as an alternative to prosecution.

Having in the space of three weeks achieved a degree of unpopularity almost incredible to a man who has hitherto encountered only the genial side of his fellow-creatures, Philip turned from the garage to the office. Here his troubles were of a different kind. Commercial arithmetic had no terrors for him; the systematic filing of correspondence and the compilation of crossreferences appealed readily to his orderly soul. His difficulties arose not so much from these mechanical aids to commerce as from the human agents who wielded them. Mr Atherton, the young gentleman who presided over the showroom, was, as already indicated, a square peg-The careers open to a younger son of a wellconnected but impecunious house are strictly limited in number. Presuming, as is probably the case, that the family resources are already fully taxed in maintaining his elder brother in the army, and that he himself is debarred through insufficiency of gray matter from entering one of the three learned professions, young hopeful is forced to the inevitable conclusion that he must earn his living in some less distinguished field of effort.

'Not in *trade*, of course, dear,' says his lady mother, with the air of a female Euclid throwing off an elementary and self-evident axiom. 'But anything else you like.'

The unsophisticated observer might be excused for imagining that the maternal proviso extinguishes our young friend's prospects of a career altogether. Not so. To the upper classes of this country there are trades and trades. You may become a land-agent, for instance, without loss of caste, presumably because you cannot possibly make any money out of being a land-You may also become a stock-jobber, possibly because a stock-jobber's earnings cannot by any stretch of the imagination be regarded as the fruit of honest toil. You may go to India, or Ceylon, or Canada, and there, in the decent obscurity of a foreign clime, live by the work of your own hands. You may even go upon the stage, in a gentlemanly sort of way. But you must not go into trade. You must not buy or sell merchandise in the open market, though, as stated above, you are perfectly at liberty to sell what you have not got, and buy what you could not pay for if you received it, in the world of Bulls and Bears.

However-no one seems to know why, but the undisputable fact remains—you may sell motorcars for a living and remain a gentleman. It is not known who discovered this providential law of nature; but ever since its establishment wellborn young men have swarmed into the profession; and now the humblest purchaser of a motor-car may quite reasonably hope to have his cheque endorsed, and mayhap a cigar accepted, by the descendant of a duke.

The innovation has proved a commercial success, too, or we may be sure that it would not have endured in the unsentimental economic world for a twelvemonth. Pace Mr Mablethorpe, the immaculate young man who attends to our wants in showrooms knows his business. He is a fair mechanic, a fearless driver, and an excellent salesman. Customers of his own walk of life confide their wants to him as to a brother. while plutocratic but plebeian patrons frequently purchase a more expensive car than they originally contemplated through fear of losing his good opinion.

But there are exceptions, and Mr Atherton was one. He was grossly ignorant of the elements of mechanics, he was unbusinesslike in his management of correspondence, and he was rude to customers without being impressive. He was also a frequent absentee from his post upon matinée days. The indoor staff, down to the very office-boy, took their tone from him; with the result that Philip, in the execution of his duty in the office and showroom, was enabled without any difficulty whatever to eclipse the degree of unpopularity already achieved by him in the garage and repair-shop. But he ploughed resolutely on his way.

In order to be near his work he rented a small flat in Wigmore Street, and furnished it according to his ideas of what was requisite and necessary. He cooked his own breakfast, and took his other

meals at Frascati's.

Each afternoon an elderly and incompetent female called, and—to employ her own grim expression—did for him. That is to say, she consumed what was left of Philip's breakfast, and made his bed by the simple expedient of restoring the bedclothes to their overnight

His bedroom furniture he bought en suite in Tottenham Court Road for seven pounds fifteen. In his sitting-room he installed a large table upon which to draw up plans and specifications -and an arm-chair. It did not occur to him that he required any more furniture. He cooked his food at a gas-stove, and ate it off a corner of this table, sitting on the arm of the chair. The sole ornament upon his mantelpiece was a model of the Meldrum Carburettor, recently perfected and patented. He made no friends, and went nowhere. A woman would have (and ultimately did) shed tears over his ménage. But he was happy enough. Things, not People, still held him bound.

And yet he was not utterly at peace with his world. It is said that a woman is always happy unless she has something to make her unhappy, but that a man is never happy unless he has something to make him happy. Up to this period of his life Philip had never had to hunt for the sources of happiness. His work, and the ever-developing interests of youth, had kept him well supplied. But now, at times, he was conscious of a shortage. Under the increasing cares of existence mere joie de vivre becomes insufficient as a driving-power, and demands augmentation. Philip's present life—if we except odd hours in the evening devoted to the perfection of the Meldrum inventions—was an ungrateful business at best. He had few friends, and was not of the breed which can solace itself with the companionship that can be purchased in great cities. And therefore he began, inevitably, to draw his necessary happiness from the bank of the Future. Most of us come to this in time, for few are fortunate enough to be able to subsist year in, year out, upon our current income. When we are young we draw upon the Future, and when we are old we fall back (please God) upon the Past. So Philip began to live for the day upon which his reforms should come to fruition, and the work in the London offices find itself running forward on oiled wheels. As for the Present—it was a rotten business, but difficulties were made to be overcome. En avant /

But beyond these practical aspirations lay a fairer region. Philip was in love. Not with any material pink-and-white charmer, but, after the perfectly healthy and natural manner of the young man before he grows cynical or blase with experience, with Love itself. Only that. At present he was more concerned with the abstract than the concrete.

At this period he was inclined to regard matrimony much as a child regards cake-namely, as a consummation to be achieved only after a long mastication of bread-and-butter. At present he was in the thick of the bread-and-butter. But when he had worked strenuously for perhaps ten years he would assuredly encounter his Lady -he had no clear idea what she was like, but he was absolutely confident of her existenceand would marry her. Then he would be paid in Troubles would be halved and joys doubled, and life itself would be the sweeter for the long years of hard service and clean living and high endeavour that lay at present between the dream and its fulfilment.

Meanwhile he was content to hitch his wagon to a star and proceed with the day's work. Business first.

(Continued on page 291.)

A HOME LIBRARY OF MODERN FICTION.

I have read novels with the most fearful contentment of mind. . . . How do you like your novels? I like mine strong, 'hot with,' and no mistake; no love-making, no observations about society, little dialogue except where the characters are bullying each other, plenty of fighting, and a villain in the cupboard who is to suffer torture just before the Finis.—THACKERAY.

THE quantity of fiction which pours from the press is greater than ever. The wheels of the fiction factories, energised by author and publisher, turn out five or six volumes daily of new books and new editions for the delectation of the modern reader. In the United States about one hundred novels and two thousand short stories are issued every month. Out of every hundred novels written it has been said that only one gets into print, so the publishers are to be thanked for damming back this stream. To remember even the titles of this steady flow of light literature is a sheer impossibility. To attempt to sample them is equally so. When we find that not less than 80 per cent. of the books borrowed from circulating libraries are comprehended under the heading of fiction, the necessity for guidance and self-restraint is evident. The habit of reading only light literature in the form of fiction is one of the dissipations of modern life. It forms, however, one of the best relaxations we have, and is greatly educative as well. Anthony Trollope, a master-craftsman himself, used to deliver a lecture on 'English Prose Fiction as a Rational Amuse-M. Anatole France has said that England is the home of the novel: that in its nature it is intimate, cordial, and homely, and that the English mind is homely, intimate, and cordial.

The general level of excellence is wonderfully high; the number of those who can with credit to themselves and interest and delight to the reader write a satisfactory story is on the in-Yet the pitfalls are many for the indiscriminate reader. We hear of these when certain novels are put under the ban of the Libraries Association, a certain method of causing them to be asked for, and therefore increasing their circula-Martyrdom might await the ancient prophet who cried aloud against the diseased moral conditions of his time. The modern novelist who throws the limelight of realism on the seamy side of life expects to be paid abundantly in coin of the realm. The novel is made the vehicle of all the ideas and burning questions that seethe in the minds of men and women. Every human interest is represented; sex problems, socialism, politics, religion, travel, and adventure all have their place. Love, marriage, and the romance which hangs around them are staple themes. R. L. Stevenson has said that the writer who knows his trade might start with the kitchen table as a subject. A simple classification of novels is that by Henry James into those which have life and those which have it not. Some people, for excellent reasons, he says, do not like to read about carpenters; others, for even better reasons, do not like to read about courtesans. The novelist has all life for his province, and every taste is catered for. He is a public benefactor when he writes a pure story that grips the reader without too great a strain on the attention.

Besides the variety and abundance is the cheapness of fiction. Think of stories by the best modern writers from sixpence, sevenpence, one shilling, two shillings, to six shillings! Are there any products of modern life, of equal value, to be had so cheaply? The 'three-decker,' as the three-volume form was called, at a guinea and a half, disappeared towards the end of last century. It was purely for circulating library consumption, and was at its best in the mid-Victorian era. To-day the bookseller is made to do more work for very little profit in stocking and selling cheap editions. The sevenpenny novel has not to him been an unmixed blessing. Such cheapness is only possible with a universal sale.

Three months is given as the average life of a modern novel. It is a success if it lives through a season. In two years it may be put into a series. When a publisher selects a novel for a place in a cheap series, he does so with a certainty that it possesses life, is interesting, well written, and calculated to make a wide appeal.

George Meredith, after writing for nearly forty years, said that in England he was encouraged by but a few enthusiasts: 'In my branch of the profession of letters the better the work the worse the pay.' George Eliot is an exception to this; she did good work and had good pay. Anthony Trollope, with no very high ideals save to amuse and entertain, and tell a story well, received from English publishers for his works a little under seventy thousand pounds. His American receipts were three thousand and eighty pounds, and he earned seven thousand eight hundred pounds from other sources. For his Claverings he had a single cheque from the Cornhill Magazine for two thousand eight hundred pounds; The Small House at Allington, which also appeared there, yielded him three thousand pounds; two other works brought him three thousand two hundred pounds each; Can You Forgive Her? made three thousand five hundred and twenty-five pounds. It is a pity that Trollope did not write his proposed history of English prose fiction, beginning with Robinson Crusoe.

When an author determines to write, not for posterity, but for the demands of the hour, he may, like G. A. England, turn out many thousands of words annually from his fiction factory, and earn

something more than a living wage. 'My eye,' he says, 'is ever open, also my ear, for every bit of good material coming my way. Into the note-book goes now a bit of scenery, a face, a phrase; again some new idea, a plot germ, an odd garment, a deformity, a beauty.' Like the rest, he picks up material for his stories everywhere! And thus, as Thackeray says, fiction often carries a greater amount of truth in solution than the volume which purports to be all true!

Both entertainment and instruction may be gained by starting an interested group of people upon the discussion of their favourite novels or favourite characters in fiction. All present may take part, and violent likes and dislikes will find expression. Criticism seldom strays far from the truth, however, and there is a consensus of opinion as to what is best regarding the books that matter. A lecturer on novels or novelists is certain of a hearing. In these days of cheap editions any private person may select from the cheap series a list of excellent novels. For some years past the present writer, after sampling them himself, has made friends and acquaintances free of the collection on his bookshelves containing between three and four hundred modern stories. They could take what they pleased, and return them at convenience. convenience of some borrowers meant a year, of others months or weeks. In only a few instances did the volumes entirely disappear. For the classics in fiction, Scott, Dickens, Thackeray, Meredith, Hardy, or George Eliot; for Mrs Barclay of Rosary fame, Hall Caine, Marie Corelli, and other well-known names, they had to look to their own shelves or elsewhere. strong and well-known representatives of modern fiction can look after themselves. The story was always the thing for my readers, let it be written by whom it might. But indeed the classics in fiction were seldom asked for. Are there not readers to-day who unblushingly say they cannot read Scott, do not care for Dickens, and leave Thackeray severely alone? Theodore Roosevelt has made this true observation, that 'the reader, the book-lover, must meet his own needs, without paying too much attention to what his neighbours say these needs should be.' He found endless satisfaction in reading The Semi-Detached Couple, but never met any one outside his own family circle who had read it. So the stories that delight you and me are not, of course, all written by the great names in literature.

A writer with a gift of humour is friend to every one. Spanish Gold, by G. A. Birmingham, never failed to tickle readers and give amusement; while the books of Dorothea Conyers, such as The Strayings of Sandy, and those of Somerville and Ross, never failed to captivate. Another master in adventure and Irish humour is Mr H. de Vere Stacpoole, who found many readers for The Pools of Silence (my copy has sunk in that

pool), The Ship of Coral, and Garry Owen. His Patsy, alas! disappeared after helping the gaiety of many. Though Mr W. W. Jacobs was represented only by Captains All, Light Freights, and Odd Craft, he was a favourite with most readers. The works of Sir J. M. Barrie and Ian Maclaren seemed so well known to my clients that they reposed on my shelves unasked for. The works of Sir A. Conan Doyle were likewise well known. John Galt was only once asked for, and that by a lady. Not so with what we call the American group of stories, which were fresh and exceedingly popular, by Stuart Edward White, G. Stratton-Porter, Rex Beach, Meredith Nicholson, and Ralph Connor.

The Century Company of New York, when handling a short story by E. H. Abbott, entitled Molly Make Believe, thought that it was one of the best stories of the kind they had ever seen. Most of those who read my copy were of the same opinion. It is a pity that in the English reprint the fine and suitable illustrations of the American edition have not also been carried over. A later volume by the same writer, The White Linen Nurse, is said to be equally piquant. All the stories by Kate Douglas Wiggin (Mrs Riggs) were well liked, particularly Rebecca of Sunnybrook Farm and Timothy's Quest. So were Mrs Wiggs of the Cabbage Patch and Lovey Mary, by Alice Hegan Rice. The Lady of the Decoration, which now has a sequel, gave pleasure to many; those bright and charming letters of an American lady in Japan never failed to please. Pa Gladden, by Elizabeth Cherry Waltz, full of the milk of human kindness as it is, always made an impression. After reading A Shepherd of the Hills, by H. B. Wright, some of my readers did not wonder that his books had reached the four million mark in the United States. The Virginian, by Owen Wister, has gone and left no address. We had ourselves, however, to borrow H. S. Harrison's Queed and V. V.'s Eyes, both remarkable American novels.

Many have asked the secret why the works of Gene Stratton-Porter are so popular; over three millions of her books have been sold in the United States, while they have also had a vogue here. Born on a farm in Wabash County, Indiana, in 1868, she was educated at home, and in 1886 married Charles Darwin Porter. She has acted as natural history and photographic expert on two open-air periodicals, and wrote Moths of the Limberlost, that swamp in Indiana with the flora and fauna of which her readers are made so familiar. Her stories are incitements to self-help, clean living, and high thinking; while the characters live near to nature's Nature is a living thing to her. Her books have also found thousands of readers in Great Britain, where Freckles (the story of an Irish boy), Girl of the Limberlost (that of an American girl), and The Harvester have been prime favourites. The suggestion for this last came from the life of Henry David Thoreau. Its amazing vitality, beauty of description, and romantic setting have caused this to be the most popular of her books with many readers. She herself is the 'Bird Woman' of these stories. While in search of birds and moths she has gleaned and gathered dramatic stories which have charmed millions of readers.

The other books found to be pleasant and popular in my free private library included those of George MacDonald, particularly Alec Forbes and Robert Falconer. Arnold Bennett was represented by some of his ethical books, by Anna of the Five Towns, Teresa of Watling Street, and a masterpiece of its kind, The Old Wives' Tale. John Oxenham was another favourite. We had not all his thirty stories on hand; but Barbe of Grand Bayou, Profit and Loss, The Long Road, Giant Circumstance, and some others found many readers. This writer always makes a careful study of plot, characters, and scenes, in which, like John Wesley, he has 'the world for his parish.' The breezy, open-air feeling and old-world atmosphere, reminiscent of Borrow or Stevenson, in the works of Jeffery Farnol are charming; and the Kentish highways and byways are again full of life in The Broad Highway, The Money Moon, and The Amateur Gentleman. M. Pickthall's Said the Fisherman is, of its kind, a wonderful story, with a true Eastern atmosphere, less favourable to Turkish conditions than Pierre Loti's Disenchanted. In Concerning Himself, Victor L. Whitechurch tells an uncommon story which

grips the realities in a commonplace life, but not in a commonplace way. The Baroness von Hutten, in Pam and What Became of Pam, was popular; but we have also been asking what became of our Pam. The Countess von Arnheim (Beauchamp), in her Elizabeth and her German Garden, A Solitary Summer, Elizabeth in Rügen, and their successors, charmed more than most. Leonard Merrick (Miller) shows himself master of the short story in The Call from the Past. Miss J. E. Buckrose, with a Hull background, was much liked in Down our Street and A Little Green World; the first went down our street and did not return. F. Marion Crawford, a born story-teller, has always a story to tell, and seldom disappoints. B. M. Croker, Flora Annie Steele, in their stories, and Maud Diver, in Captain Desmond and The Great Amulet, bring India close to the reader. All these were popular: The Scarlet Pimpernel, by the Baroness Orczy; Call of the Wild, by Jack London; Peter's Mother, by Mrs H. de la Pasture; Daft Days, by Neil Munro; Pip, by Ian Hay; The Weavers, by Sir Gilbert Parker; The Street of Adventure, by Philip Gibbs; The Saint, by Fogazzaro; and Nancy Stair, by E. M. Lane.

As the shelves got congested there were gradual clearances. Some hundreds of volumes of miscellaneous literature had to go back to the booksellers for next to nothing, but the overplus of fiction was generally bestowed on grateful recipients at home and abroad. The most grateful were those abroad, in North India, Burma, South America, or Switzerland.

JERRY'S PRAYER.*

By Mrs George Crichton Miln (Louise Jordan Miln).

AT last she was alone, free to sit and think it all out calmly—to realise it, face it, if she could. If she could? She had to face it. The axe had already fallen.

It was nearly midnight; but, tired to extinction as she was, she had no wish for bed. Tomorrow she must confront the glare and the pain, and do the best she could-for the children's sake-with such poor shreds and patches of possession and opportunity as the thievish law had left her. To-night she might sit alone, unwatched, unpitied, and unadvised. There was some balm in that. The children were abed, the servants too, an hour ago and more. The night and the silence were hers. She was too worn out, too distraught, to keep her mind to the paramount subject upon which it was imperative that she should keep it. For she must decide here and now where they were to go, what they were to do.

Thinking of the Law-her smarting sense of

its injustice made it personal—swung her unsteady, pendent mind to law-breakers: the great outcast, skulking class of the professional lawbreakers. And to-night her sore sympathy was with its branded Breaker rather than with the majestic Law. What thief, enterprising housebreaker, or petty pickpocket was half so criminal as the Law that had stolen this, their home, from her and from her three helpless children? None. None could be.

She shivered a little. The great room was growing cold. She mended the fire, piling the big logs on with a reckless hand. She was glad to think that she was wasting Greville Sloan's The thought warmed her more quickly fuel.

than the upspringing flames.

Edith Ramond's story was very brief, very simple, very commonplace. To her and to her three children it was a tragedy. A penniless girl-governess, in Rome, she had married John Ramond, an English artist, almost as young as herself, and quite as poor. His father, well-todo and insular, had disowned him; angered by

^{*} All rights reserved by the Author.

a succession of undergraduate pranks, angered beyond repair by the son's persisted-in determination to be a painter. And there seemed no reason to hope that the elder Ramond would ever relent.

Indeed, there was more right on his side than on the son's. The younger man was stubborn, lackadaisical, visionary, opinionated, and lazy. He had little or no talent. He had wasted his time at Wellington and at Oxford, and after his marriage he wasted it at Rome. He had worked, after a fashion, rather than starve, when he first broke with his father. But soon after the imprudent little wedding, Edith, who had a delicate wrist and an industrious soul, in an evil hour began timidly to design Christmas cards and menus. Her work sold readily-for a pittance; and her big sloth of a husband sank back on the pittance and lived on it, till goodluck and Roman fever translated him to a realm where it is to be hoped he was compelled to shovel coal vigorously.

Edith grieved bitterly. She had believed in him, and in the slowly germinating great picture, to the last. She did not even try to sell the few daubs he left behind him; she could not bring herself to part with them; but she set herself to work harder than ever, and contrived to keep herself and her three tiny children almost decently.

A year later her father-in-law, who had been in Australia when John died, came to Rome 'to reconnoitre,' as he told the British Consul. The old man was just. He in no way blamed Edith or her innocent children. Moreover, he formed a high opinion of his daughter-in-law, and little John looked like the dead woman whom Greville Ramond had loved very truly.

The usual hackneyed old things happened, of course. Edith and her children went back to England with her father-in-law, and settled down in the old house where John had been born.

A distant relative, Greville Sloan, was already living with Mr Ramond at Brookfield House. He had lived there from his babyhood. He was several years John's senior. Undoubtedly he would have been Ramond's heir had John died childless, or had his children remained in exile and unclaimed. Nothing that Greville Ramond had was entailed.

Indeed, about six months before his own death, which had occurred six months ago, and three years after John's, the old man had called Edith and Sloan into this very room where she now sat, and had slowly read to them two wills. One was dated back five years, and left everything, without qualification or reserve, to Greville Sloan.

When Edith and her children had first lived at Brookfield and won Mr Ramond's heart, he had made a will leaving everything to her children and to her. But on second thoughts he felt that was needlessly hard on Sloan, unfair indeed, and

believed that he had done the just thing in following his more deliberate wish in the matter, and leaving his kinsman a comfortable sum.

This third will which he then read to them was of very recent date, and left Sloan twenty thousand pounds, and left everything else, in varying proportions and with various conditions, to the grandchildren and their mother.

'I should not give Grev so much,' the old man said to Edith, 'had he not at one time expected, and had every right to expect, to have everything. I have done what seems to me to be right and fair. I shall destroy the old will—the first one; the new one will stand, for the present at least, and I hope always. The second will I seem to have already destroyed, or to have mislaid'—he had always been a careless custodian of papers—'but that is immaterial. The last will stands, of course.'

Edith was perfectly satisfied, and Sloan tried to be. But he found it hard, for he was desperately in love with a mercenary woman, and, money quite aside, he did not like Edith or her children. And as a sensitive boy he had suffered unforgettable things from his selfish and brutal cousin John.

Greville Ramond, careless again, forgot or neglected to destroy the first will; or, as some believed, he destroyed by mistake the one he had intended to preserve. He died suddenly. One will was found—and only one; that one which gave Greville Sloan everything.

Sloan behaved well, at first. He begged Edith to use, for six months at least, the old place as if it were hers, and told the housekeeper to send all bills to his solicitors. And he stayed away himself. Of course he would want the house for the home-coming of the woman he now hoped to marry. But he let it be understood that Mrs Ramond would have a suitable income. And it also somehow got rumoured that, just before his death, and very much in his right mind, Greville Ramond had destroyed his last will and instructed Sloan that only under certain circumstances was Edith to be provided for, and then not extravagantly.

Some few believed this, or affected to do so. More shook their heads. And yet it was not without good vivid colour. For it was a fact, and a well-known one, that a few weeks before the old man's death he and his daughter-in-law had very nearly quarrelled.

John the grandson was now nearly ten, and, to his mother's delight and his grandfather's disgust, showed a strong bent for crayon and brush. Edith was determined that he should have an art education; his grandfather was equally determined that he should not. Mother and grandfather disputed the point hotly, and the irascible old man let out a good round threat more than once.

Had Greville Ramond lived, the daughter-inlaw must have prevailed, for she had grown very dear to the old man; and, strangely enough, John, the son of John the daubster, had a very real and rare talent. But Greville Ramond died, and the bolt fell from the blue.

To-day Edith had seen her solicitors and Sloan's, and knew definitely that she must go at once, and without the half-promised income.

This last she had brought upon herself. She was terribly disappointed at the disappearance of the latest will, and she let her tongue run away with her. She knew that Mr Ramond had had no thought of disinheriting her or her children. She knew that his reputed farewell instructions regarding herself to Sloan were a fabric of lies. She knew that Sloan had the latest will somewhere, and was afraid to destroy it lest the intermediate will, of which her father-in-law had spoken, should turn up, even now, and deprive Sloan of the twenty thousand pounds which the last will secured to him. All this, and a great deal more, she said, and just enough of the county people applauded her to make Sloan very bitter.

And then she went quite too far. Greville Ramond's wife had had a priceless collection of jewels. The last will had left them to John's only daughter, who had been named after her grandmother. Edith refused to give them up when asked for them. Of course Sloan got them, but not until Edith had made the whole matter conspicuous and disagreeable, in a way that caused him to fear that Lady Dorothy might not consent to accept them after all. Edith had fought for her 'rights,' as she called them, more tempestuously than wisely, and now she was beaten at every point.

Three further weeks' grace was given her, and then she must go, unless she preferred to be put

out.

Indeed, yes, her sympathies to-night were with the outlaw, the——

Hark! what was that? Nothing, of course, except the wind, or her imagination. She

laughed mirthlessly.

She was afraid of nothing to-night; and as for burglars, a whole regiment of them might come—and be welcome—and loot the house. The very spoons in the sideboard in the next room were Sloan's. She would stay no thief for him, raise no alarm.

The silence was absolute. Across the park

the old church bell rang twice.

Again her mind rambled away from the essential to the irrelevant. She had known a thief once; at least he had become one. She wondered where he was now—in jail or out of it? She wondered whether he remembered the little girl who had helped him at such woeful cost to herself years ago; and whether, if he knew her plight, he would do as much for her as she had done for him in their childhood's long ago—steal five pounds to buy bread with.

Known a thief! Why, she had been a thief,

and her aunt Matilda had made no bones at all about calling her one. Well, she had taken the severe whipping stoically, and never told what she had done with the gold. She swore she had What a little fool she had been to own that she had taken it! And, after all, what a vixen she had been to steal it from poor, hardworking Aunt Matilda, the only friend her childhood had ever known! It was the quarter's rent, as it turned out; and after the whipping Aunt Matilda had sat down and cried pitifully. She had never forgotten the uncanny picture of the grim, gaunt old woman swaying convulsively in her grief. Edith felt guilty now, as she must have done then had not her spirit so tingled in answer to her tingling flesh.

She wondered, and then she screamed. Some one—something—was coming in through the library's long window. Stiff, and dumb with fright and threatening hysteria, she clung desperately to the arms of her big chair. She tried to

scream again, but she could not.

"Ush, laidy," said the rough, furtive fellow who almost instantly slipped into the room. 'Doan't ye make no noise. An' doan't ye be

cared. I ain't goin' to 'urt ye.'

Edith Ramond pulled herself together a little. Perhaps he wouldn't hurt her or her children if she told him where everything was; she had heard of such things often enough, and she could be his confederate with right goodwill and a clear conscience too, since that arch-thief the Law called everything here Greville Sloan's.

'The silver is in the dining-room, and in the

safe.'

'I ain't wantin' anythink to-night, laidy. I've called to pay a debt—a debt o' honour. Now doan't ye look so scared. I ain't boozed an' I ain't balmy. You spotted me all right, an' my trade is jest what ye savyed it wos. But this ain't no business call. See, laidy, I ain't got a single tool with me, so 'elp me!'

'What do you want, please?'

'I'ad to come this way or not at all. It ain't 'ealthy fur me in these 'ere parts by dyelight. I bin watchin' for ye some considerable nights now. I'ad to see ye. I could ha' posted ye the dockyment all right. But I didn't see sendin' my address by post, an' you may want it. Ye may need my hevydence. I 'ope as 'ow you doan't. But then, again, ye may. Laidy, I've called to pay a debt. I bin owin' ye five quid for twenty-two year'——

'Jerry!' she cried—'Jerry!' Then that was why she had been thinking of him so persistently as she sat before the fire. She had sensed his

coming.

'Yes, Miss Hedith, mam, it's me—it's Jerry. Ye guessed it the first time. An' ye ain't forgot?'

'I was thinking of it as you came in.'

'Was ye, though? Well, Miss Hedith, I've come to pay hup.'

'You've brought me five pounds?' said Edith, gazing curiously at the poor, shabby figure.

'More'n that, laidy,' said the convict proudly. But Mrs Ramond interrupted him. She had seen the prison pallor, and had misunderstood it. 'Sit down, Jerry!' she exclaimed. 'Sit down at once! You are tired and ill.'

'It doan't seem right,' he said awkwardly.
'An' I guess I'd rather not.'

'Do as I tell you, Jerry.'

'You doan't seem much afraid o' burglars, Miss Hedith, mam,' he said.

'I'm not afraid of you, Jerry.

'You ain't got no cause to be,' he said proudly. Then he obeyed her with an apologetic cough.

'Now, Jerry,' said his hostess, 'before you say another word, I'm going to get you some food. You are cold and hungry.'

The man half-started up, and then sat back

with a strange, silent laugh.

'Thank you kindly, miss. I ain't 'ad more 'n I could eat comfortable to-day.'

She hurried from the room.

As she went he spoke again. 'Miss Hedith,' he said, 'you ain't goin' to call nobody, or give no alarm loike?'

'Jerry!'

'You'll excuse me for mentionin' it, an' I'd be the last to blame ye. But you 'ave a little talk loike with me first. You may want my hevydence.'

'Jerry!'

Then he let her go.

At first he sat quite still. Then he thought better of it, and got up, saying, 'Arter all, she's a woman. I'll mike sure.'

He moved about the room swiftly, with practised noiselessness. He was looking for something. A great Bible rested on an ebony pedestal. Jerry drew from an inner pocket a long manila envelope, very much such an envelope as those that form a chief extravagance of unsuccessful authors, and thrust it in between the sacred leaves. It is probable that he had never heard the old Provence proverb: 'Ce que Dieu garde est bien garde.' It was even possible that he did not recognise the Book.

Presently Mrs Ramond came. She brought him bread and game and wine—the best port

that she could get.

He ate and drank awkwardly, and he was not long.

The church clock struck three.

'It'll be loight soon,' he said. 'Let me tell ye now.'

Edith nodded.

'I doan't know as I've 'ad but one real kindness done me in all me life, miss,' he said gravely, 'so it ain't strange if I remembers it some. We 'ad a powerful bad name in the ole place, we 'Awkins, an' no won'er! There wouldn't no one but you 'ave 'elped me that time w'en mother an' Laura was down sick, an' the ole

man an' Jim both' on 'em in jail. That five quid saved Laura's life loike—it did, sure to Gawd, Miss Hedith. I doan't know w'y I was so powerful fond o' that kid sister o' mine, but I always wos'——

'Where is Laura now, Jerry?'

'She went to the devil, an' then she died,' was the gruff answer. 'I'd ha' kept straight but for that, so 'elp me. I always meant to. But that ain't biz,' he added hastily, 'an' I came 'ere to talk biz. A week ago a pal o' mine an' me, we cracked a crib in a swell flat 'ouse near Cavendish Square.'

Edith started.

'Yes—'is. You never 'eard nothin', cause it's been 'ushed up, the perlice 'opin' to come hup to us better that way. Well, along wi' the rest o' the loot wos w'at purtended to be a music-box, an' the top part wos. It didn't look wurth much, but my pal 'e got a kid as is mad for music, so we thought we might as well tyke it along loike, seein' as 'ow we wosn't in no kind o' 'urry, the gent bein' away fur some dyes an' the 'ead porter a friend o' mine. Oh 'ell! that was a rum break fur me to maike; but ye won't split—no'ow?'

'No,' said Edith hoarsely; 'I won't split.

Go on.

'Well, as I wos sayin', miss, we took Pad 'ome.'

Edith looked puzzled.

'Paderowski in a box; an' w'en we got 'ome we bu'st open the drawer part at the bottom, 'cause it didn't look like a drawer none, an' yer never knows yer luck.'

'You broke it open, and you found a will?'

'Sure we did. You guessed it first time again, miss.'

'Give it to me, Jerry! Give it to me!'

'That's wot I come fur.'

'Oh Jerry!'

'You was mighty good to Laura oncet,' he said slowly. 'It wur considerable trubble I tuk, miss. An' it were a pleasure to tyke it. I doen't recall as 'ow I've enjoyed pyin' a debt afore. Per'aps as 'ow this un wos a debt o' honour hit makes me feel such a toff. We know considerable law in our biz, miss. We 'as An' we picks hup a lot more andy loike. Well, I seed yer name. I bin back to the ole county now an' then, an' I knew the name o' the gentleman yer 'ad married wi', an' I knew 'is father's county. W'en I seed yer name I read that dockyment mighty careful. Next dye I 'ad a friend wot reads writin' jest loike rollin' off a log, an' wot ain't got nuthin' agin 'im jest now, go to Somerset 'Ouse, an' look up ole Mr R'mon's last will an' testiment, the one as 'ad ben promoted, an' bring me wurd. w'en he did I jes' looked hup trains an' 'ooked it fer 'ere quick. I hain't no bloomin' Turney-General, but I sees easy 'nuf as you has been played mighty darned low down.'

He had said his say, and he sat quite still.

For a little Edith Ramond could not speak. When she could, she said, 'And the will you found, Jerry—where is it?'

If the thief felt any disappointment that the lady had not found time to thank him first he showed none. Perhaps he felt none, since, as he said, 'Arter all, she's a woman.'

'Ye'll find it all O.K., miss, in that big black volum' on that 'ere sawed-hoff thing.'

'Why, how on earth'-

'Well, ye see, axin' yer pardon, Miss Hedith, w'en ye went to get the grub I thought as 'ow, bein' a laidy, ye moight get nervous loike, an' 'phone hoff—w'ere I couldn't 'ear yer—fur the perlice, or somethin' o' that sort. An' so I jest popped it in that there w'ere ye'd be sure to foind it. Hif I'm hany jedge, you could prove it genewine all right, hany'ow; but I thought as 'ow ye'd find it hall smooth fer sailin', hif 'ow has hit wosn't reserrected loike on me.'

The woman's eyes swam. She laid a hand on the convict's rough sleeve. 'Jerry,' she began

brokenly, 'won't you'---

'No, miss,' he said gently, with brisk clair-voyance. 'I think I wonat. If Laura 'ad a lived it 'u'd be different; but she didn't, and has I sizes it hup, the way I'm goin' suits me roight enuff. Miss Hedith'—and his shifty eyes sparkled for a moment—'ow can ye be so cruel loike as to want to tyke the bread from so many noble men an' wimmen an' their innercent children?'

Edith looked blank, and he explained gravely, 'W'y, Miss Hedith, mam, perlice an' the lawyers an' the jailers an' the jedges, an' all their wimmen an' children, 'u'd clean starve if me an' all me mates wos to lead a "new life." Yer niver thought o' that now, did yer? They has a rare lot o' wives them sort o' fellers. At least one a piece mostly'——

But Edith shook a sorrowful head at him.

'Come now, miss, doan't you feel bad. I'm right enuff. Hin jail or hout, hit's about the syme to me. Hit's toime fur me to be off now, mam. But'ere's w'ere a letter'll reach me hany toime—if yer needs me hevydence. Hif yer doan't, ye'll burn this, an' ye'll be perticularly careful o' it hanyway? I doan't reckon as ye'll need me. But if yer do, I'm ready!'

'And send yourself to jail again, Jerry?'

'Oh that!' the man said contemptuously.

'I'll not need you, Jerry,' Mrs Ramond said firmly.

He turned toward the window.

'Oh Jerry,' she cried, 'not without letting me do something for you? Not without telling me what I can do '——

'Jest that way, mam, please. I can't tyke pay fur this job.'

'Pay! Oh Jerry! as if I'd offer it! But you'd let me—as a friend'——

'Thank you fur the word, laidy—has a friend,

miss!' He seemed to turn the thought over in his mind.

'Ye've got three kids, Miss Hedith—them as the ole gent's will names?' he said slowly, presently.

'Yes, Jerry.'

'Does they say their prayers? Then, miss, has a friend I'd tyke it very kind if sometimes, w'en they sez their little prayers, ye'd let 'em mention my poor girl Laura. I've 'eard tell as Gawd 'as a very special way o' listenin' to wot little kicksers asks o' 'Im. I doan't know 'ow to talk to 'Im no'ow, an' fur myself I doan't want nuthin' no'ow. Jail 's good enough fur me hany dye. I'm bin hin more 'n I've bin hout since I seed yer. But fur Laura, Miss Hedith, w'y, I'd heat 'ell fire—so 'elp me Gawd, mam, I would—an' swear it wos nice an' coolin', if it 'n'd do Laura hany good hup yonder; but only I doan't know 'ow'—

Edith held out her hands to the thief, and he took them in his crime-stained clasp. For a long moment they stood silent. Then he said brokenly, 'Gawd bless you, laidy!' And she whispered back, 'God bless you, Jerry, dear

old friend!'

Surely God heard. Then Jerry went.

In a moment Edith went to the old, old Book. She took the long envelope to the fireside.

Yes, this was the will.

His father's home was saved to the boy!

Poor Jerry's address had fallen to the floor. She picked up the crumpled paper and smoothed it out tenderly. She would burn it at once; but first she would make some secret record of the address. She must try to help Jerry presently, in spite of himself.

She looked about the big room. Where could she jot down, in a way that would tell nothing to any one else, the somewhat suggestive address? She had no thought of needing it, but Jerry

might need her.

She wheeled out the library ladder, and from an upper shelf took down an old Latin Primer that had been her husband's. Greville Ramond, even in his anger, had hoarded everything that had once been John's.

Then she put the school-book back. Her boy should have that some day, just as his father had left it. She would not write on its margins. What was this? 'Farm Accounts.' An old account-book, by its date. Her father-in-law did hoard such rubbish! She carried it to the table, found a pencil, and copied on a half-blank page Jerry's address, without his name.

As she took up the account-book to replace it—better so than to move it or take it away, she thought—a paper fell from its fat bulk.

Edith had found the other will—the second of the three—the will that gave everything to her and hers, leaving Sloan beggared!

Revenge was to her hand. She could burn

which will she chose. None would ever know. Greville Sloan could prove nothing. Sloan! He could not come into court with clean hands! And Jerry would swear, if necessary, that he had found this will. Or, no need even of that. To-morrow she could contrive that the old housekeeper should find either will. Sloan's tongue was tied.

She sat and thought and thought. The old church clock struck four.

Edith went to the fireplace and quietly haid

on the still smouldering embers, and watched them catch and burn to ash, Jerry's address slip and the earlier of the two wills. Why? Perhaps because she was overwrought, hysterical. Perhaps because she thought of Sloan's hungry love for Lady Dorothy. Perhaps because she thought of the old man who had been good to her, and honoured what she knew to be his ultimate will even more than she hated the man who had so wronged her and hers! Perhaps it was because God had granted Jerry's prayer.

POISON FOR GOLD.

HOW A DEADLY ACID ASSISTS THE WORLD'S WEALTH.

By ROBERT T. PATERSON, Editor of the Transvaal Critic.

IT will probably be as surprising, as it is doubtless new, to the average reader to learn that the material and assured success of at least one of the greatest goldfields of the world is due to the assistance of one of the most deadly poisons known to man. The chemist plays a far from inconspicuous part in the world's drama, and it is not too much to say that he is the magician of the modern gold-mine.

It is perhaps unnecessary to point out that gold is not dug out of the earth as one extracts, say, potatoes or turnips. No; it is literally 'won' after a hard battle with the elements with which Nature has seen fit to guard her treasures. On the great goldfield of the Witwatersrand, in the Transvaal, six thousand feet above the level of the sea, nuggets remain, as they have ever been, a dream, whatever the experiences of the 'fortyniner' of California or the 'fossicker' on Australian El Dorados may have been. The golden lure which has made Johannesburg the most cosmopolitan of cities is nowhere 'visible;' while its actual existence is only evidenced by unsightly, belching smoke-stacks and mountainous masses of 'tailings,' or fine white sand. It is with these latter, or rather with their evolution, that it is proposed to deal in this short exposition of a deadly poison's active but beneficial influence.

It is an accepted fact by those whose knowledge of the conditions is no greater even than that of the average layman, that the nature of the gold deposits of the Rand is such as to render most of the individual mines anything but paying propositions under systems, at one time at least, found perfectly feasible in other parts of the globe. There, on the Ridge of the White Waters, whence comes at least one-third of the world's wealth, visible gold is a thing of the past, and the precious metal is hard-held in what may be termed an iron hand; for, not content with imprisoning it in mere crushable stone, Nature has still further secreted her gold in what is known to geologists as iron pyrites. In these tiny shining specks, which to the uninitiated seem the 'real thing,' the life-pursuit of millions is contained, and no amount of crushing will extract it. It is here that our friend the chemist comes upon the scene with his stuff, three drops of which in solution would suffice to kill a grown

Not all the gold, however, is so tenaciously held, and to obtain this from what is known as the 'free milling' ore, the rock is beaten under mighty iron stamps, weighing two thousand pounds each, until—in a fine sand, and mixed with water-it is poured in a muddy flood over copper plates covered in mercury (quicksilver). These catch up the 'free' gold, leaving the still water-borne sand to be carried away in little wooden canals or flumes, until, in huge vats capable of holding hundreds of tons, it is collected in order to undergo medicinal treatment.

Now, while the water is being drained off the vats, a word about the origin and nature of this mysterious agency which liberates gold almost as quickly as it can destroy the life of man and beast. As a salt, in beautiful snowy cubes, it is known as cyanide of potassium, and is a salt of hydrocyanic acid, or prussic acid, the well-known swift and deadly poison. In minute quantities it is found in the kernel of the otherwise luscious peach, and is what imparts that bittersweet flavour known to the inquisitive who break open the stone of that fruit.

For purposes of commerce, however, other methods of production have to be resorted to; and thus to prescribed quantities of carbonate of potash (the common pearl-ash of commerce) are added horns of animals, blood, feathers, hair-This weird in fact, anything nitrogenous. mixture—almost worthy to rank with the contents of the famous witches' cauldron of Macbeth—is subjected to a fierce heat, and the resultant product is cyanide of potassium.

The vats being now ready, and quantities of the cyanide having been dissolved in water to an approved strength, the solution is poured upon the sands in the vats until they are submerged by a few inches. The cyanide solution immediately begins to exercise its functions by attacking the gleaming pyritic crystals and eating out the imprisoned gold, so that what previously looked like a collection of diamonds under the microscope now presents the appearance of furnace slag.

After a few hours of this treatment the gold is, almost to a grain per ton, in solution; and, deadly as ever, this is run through pipes into long, narrow, partitioned extractor-boxes, the compartments of which are filled with fine zinc shavings. As is seen by the brisk bubbling of hydrocyanic acid gas which ensues, the gold is rapidly taken up by the zinc, which discolours and 'rots,' ultimately becoming a thick black sludge resembling nothing so much as filthy river mud! But, oh, what precious mud! The writer has time and again put his finger into the solution in order to taste the characteristic bittersweet flavour of the cyanide, while if a lighted match is held to the bubbles above referred to tiny explosions result. Some of the workers in these extractor-houses on the mines are peculiarly susceptible to poisoning through the skin, and if they neglect to wear the long india-rubber gauntlets provided, suffer terribly from swollen and blistered hands and arms.

A curious feature may here be noted—namely, that while neither horses nor dogs will touch the cyanide solution, it has a quite extraordinary fascination for cattle. When the solution has become very weak, and contains, if any, mere traces of gold, it is frequently run off when no storage-room remains for it. The instant any browsing cattle near scent it down-wind they will gallop for it wildly, heads down and tails in the air, and will literally drink themselves to death, dropping with their mouths in it! The writer has seen eight young steers together fall victims to this weird taste before they could be driven from a tiny stream of very weak solution which had not been railed off!

At the end of the month the flow of solution through the boxes is temporarily stopped and the unaffected zinc is removed; and after the addition of alum or lime has cleared the coalblack liquid, the pure solution is carefully siphoned off as close as possible to the muddy deposit—which, be it remembered, is gold, and not to be trifled with! This literal 'pay dirt' is then scooped up into pans and left to dry for a time; after which it is placed in a calciningfurnace on a thick iron plate heated to a cherryred. This is to burn off the zinc which has succumbed to the chemical action of the cyanide; and after very careful ravelling with iron rods for the purpose, a chocolate-coloured powder Here we have the long-suffering gold in another form! The powder is then drawn off with much care—for it 'dusts' very easily, and there are better ways of breathing an atmosphere of gold!—and, being mixed with due proportions of clean sand, carbonate of soda and borax is placed in plumbago crucibles and subjected to the fierce heat of one thousand degrees, which the smelting of gold demands.

Great care must be taken that the mixture does not 'freeze' through a fault in the temperature of the furnace, as vexatious troubles and delay thus take place; but, all being well, the crucibles are in due time removed and their boiling contents poured into an iron mould (usually conical), where the gold by its weight percolates to the bottom, leaving the mass of often gorgeously coloured glass slag to cool and harden above it. This accomplished, the mould is overturned, and there, pointing at us as if in accusation after its various trying metamorphoses, we see a 'button' weighing several ounces of more or less pure gold. This, together with his brothers, is then placed in another crucible, and, a couple of whisky-bottles-empty, be it remarked!—having been broken over his head to provide a flux, is returned to the furnace, finally to be poured into a rhomboid mould, whence he issues as the component part of a weighty, wealth-suggesting 'bar' of gold.

This, then, is a rapid resume of the famous cyanide process, which, as already suggested, has been the saviour of the vast majority of the mines so busily exhausting the thirty miles of reef composing the world-renowned goldfields of the Witwatersrand.

SILENCE.

SPEAK to me, phantom souls,
Whose tender look and touch,
Before you passed beyond my sight,
Were all my joy and my delight.
Remember I loved much.

Breathe valour to my heart,
If I was dear to you;
Now that your earthly task is done,
Tell me my fight your praise has won—
You once had courage too.

Age steals not only youth,
But wearies of the strife;
Valour is left without the grace
That gave its triumph to the race
In the first pride of life;

So that we come to stand
Maimed, lonely, often sad,
While in June's sun and April rain
A vanished world is born again,
That youth may still be glad.

But far above the din
Of battle's fateful fray,
I listen, hoping to rejoice
In the loved echo of a voice
Lost on some far-off day.
BEATRICE ALLHUSEN.

THE OLD SPANISH MINES OF MEXICO.

By W. N. MUSGRAVE, B.Sc.

MANY very remarkable evidences of the enterprise and hardihood of the old Spanish Conquistadores are to be found in Mexico; and amongst the most striking of these are the thousands of mines, locally termed antiguas, from which was obtained the silver that made the colony the richest possession of Spain in the New World.

Go where you will, over the whole length and breadth of the country, and you will find that not only has the Spaniard been there before you, but that he never overlooked anything of value in the way of minerals; while a very brief inspection of any of the antiguas will convince you that these old miners knew their business very thoroughly. Down as far as the level at which water in any considerable quantity made its appearance in the workings there is very little left of the valuable portion of the lode, and what there is could only be worked with great difficulty even with the most modern appliances, on account of the very refractory nature of the

The most interesting of the old mining-camps are the deserted ones in the most remote and inaccessible places, for there may be seen mines just as they were left by the hardy pioneers of the early days of the Spanish occupation of Mexico, and every mine has some strange, and usually tragic, story connected with it.

There are few countries in which the path of the explorer and the prospector is beset with greater difficulties than in the tropical portion of the American continent; and the dangers and hardships the pioneers had to endure before they reached their goal must have been disheartening to any but the most stout-hearted. Their line of march lay through an absolutely unknown country, inhabited by tribes of hostile and warlike natives, through fever-haunted swamps and jungles, and over arid deserts and towering mountain-ranges, where the sufferings of men forced to travel under the fierce rays of a tropical sun, clad in heavy breastplate and back-piece, and with no better protection for the head than a steel cap or helmet, must have been a severe trial of endurance.

Typical of the older mining districts are those in that rugged and mountainous region which

of Mexico. Here are the once famous Tepic, Mascota, and Bramador districts, all of them noted producers of silver in their day, but now for the most part deserted; for when the ore in the mines became difficult to get at, and the patio process of the Spaniards no longer sufficed for the extraction of the silver, it soon became impossible to carry on operations at a profit in regions so far from the smelting centres. The unsettled state of affairs which existed for so many years was also unfavourable to legitimate enterprise. Not many years after the Spaniards had fully established themselves, so many bands of brigands sprang into existence that it became necessary to provide large and well-armed escorts for the shipments of silver from the mines to the coast; and, if they arrived safely, there still remained the buccaneering craft infesting the Spanish Main and the terrible hurricanes of the Gulf of Mexico. In spite of everything, however, a steady stream of precious metal found its way from this region to Spain for many years; indeed, some of the mines were producing until the time of Maximilian, who it is said obtained from them the wherewithal to pay his troops, and a few are still worked on a small scale.

Besides those mines whose whereabouts is known, there are many others which have yet to be rediscovered; for, when the Mexicans revolted against the rule of Spain, the Spanish loyalists had in many cases to abandon their properties and fly for their lives. They usually concealed the entrance to the workings by piling rocks over them, and the quick growth of the tropical vegetation soon hid these and obliterated all signs of the paths and approaches to the shafts and tunnels. Moreover, no sooner were the Spanish rulers driven out than a period of unrest ensued, during which revolutions followed one upon auother, until, some sixty years after the first outbreak, Porfirio Diaz became the virtual Dictator, and by methods suited to the character of the people he had to deal with, put down all crime and violence with a strong hand, and gave the distracted country a time of peace and prosperity such as it had never enjoyed before, and has most certainly never had since his ungrateful compatriots forced him to give up the presidency. This period of good government came too late to

be of any use to those who had to leave Mexico, and so most of the abandoned mines have been derelict for nearly a century.

When you lose touch of the railway system in Mexico you must travel on horseback or muleback, the day's journey being from thirty to forty miles, or from nine to twelve hours in the saddle. There are no roads over which it is possible to take a wheeled vehicle except in the vicinity of the larger towns; indeed, the camino real, or highroad, is a mere bridle-track which runs straight across country until it reaches some range of mountains, and then it zigzags up one side and down the other, and is so narrow at some parts that there is scarcely room for a packmule; while the track often runs along the face of a precipice, and the traveller rides with a sheer wall of rock on one side and one foot dangling ever a perpendicular drop of many hundreds of feet on the other.

One may pass through every variety of scenery and even climate in the course of a day's journey. It is quite an ordinary experience to start in the morning from a valley where one sees on all sides the huge creeper-hung trees and the brilliantly coloured undergrowth of the tropics, in a hot, moist atmosphere which makes the lightest of elothing almost insupportable, and by noon get into the foothills of some spur of the sierras, with a rolling, grass-covered country dotted about with hittle groves of live-oaks; finally arriving at dusk at some desolate pass in the mountains, thousands of feet above sea-level, where a few stunted pines are sparsely scattered over the rocky slopes, and the chill, rarefied air makes a good fire most acceptable and warm wraps a necessity.

It is in such a country as this that so much mining used to be carried on, and on every side there are to be seen evidences of great activity in days gone by. The steep hillsides are pitted and scarred from top to bottom by the mouths of shafts and tunnels, and along the banks of the numerous small rivers which run through the valleys there are the ruins of smelting-works, with here and there a village which must have been a place of some importance at one time, judging by the size and quality of the half-ruined houses. In all of them there is a good-sized church, and one sometimes finds a tomb in the burying-ground on which are carved the name and armorial bearings of some Spanish grandee of the seventeenth century who was overtaken by death before he could retire to Spain to enjoy his hardly won wealth; but the church is generally in a very bad state of repair, there is no priest to officiate, and the whole place has that peculiarly forlorn and deserted look common to all worked-out mining-camps.

One of the mines which has an interesting history is in the heart of the Bramador district. It consists of a perfect network of galleries, tunnels, and shafts which pierce one side of a deep, narrow canon in all directions; and there can be no doubt that many of the workings are very old, for some of them have been driven without the use of powder for blasting, the rock having been broken out by means of quicklime and wooden wedges. A vast amount of silver has been obtained from this mine; and the owners were particularly fortunate, for they discovered a vein of copper and another of quicksilver near by, from which they were able to get the two chemicals necessary for treating the ore by the old patio process.

About the middle of last century this mine was being worked by two brothers, who had the luck to come upon a body of ore of great value. While they were opening it up they had a quarrel, in which one of them got the worst of it. Without pausing to think that his action would injure himself as well as his brother, he set fire to a quantity of wood stored in some of the lower workings; and the fire, spreading through the mine, burnt out the supporting timbers in the tunnels, with the result that the roofs and sides caved in, and the smouldering wood in the enclosed space filled the air with poisonous gases. The brothers beggared themselves in trying to rediscover the bonanza; but, as there were no proper plans or maps of the mine, they never succeeded. From time to time since then it has been sought for most diligently by others with no better success; so the hillside still retains the secret of the position of a lode containing enough precious metal to make a very large fortune for any one who can rediscover it.

One might very reasonably inquire why it is not possible to work these old mines profitably nowadays, when we have made such great advances in the art of extracting precious metals from their ores, for there is undoubtedly plenty of ore left in most of them. But the would-be investor in any scheme of this sort would do well to remember that the old Spaniards made use of slave labour, and that silver in their time was worth many times what it is to-day. In spite of this, there can be no doubt that, with improved methods of transportation making it possible to bring in modern machinery and to ship out the product of the mines at a reasonable cost, many of these mines would pay handsomely; so it is by no means unlikely that the camps of the old El Dorado will again spring into life, as soon as the civil wars which are paralysing the country are ended.

A KNIGHT ON WHEELS.

CHAPTER XVIII -- PROPLE,

FOR six months Philip continued to give rope to his esteemed colleagues Messrs Atherton and Murgatroyd, and within that period the pair

duly hanged themselves.

Mr Murgatroyd went first. For a whole winter he waited patiently for Philip's reforming zeal to spend itself; and then, finding that things were no better, but rather grew worse, he retired from the conflict like a prudent man, and invested his not inconsiderable savings in a wayside garage upon a lonely stretch of the Great North Road, where motorists, who are always in a hurry, would not be disposed to haggle over the price of petrol or the cost of tire-repairs. He parted from Philip without rancour, and another and younger man was sent up from headquarters to take his place.

Mr Atherton was not so easy to eject, and was only disposed of in the fullness of time and by the process of filling up the cup. But he went at last, and the change of atmosphere throughout the entire establishment was most noticeable. The two clerks and the office-boy carried out their duties with what is known in transatlantic business circles as 'a punch;' the books were put in order, accounts were straightened out, business increased, headquarters said encouraging things. For the present Philip decided not to ask for a successor to Atherton. He felt that he wanted to run the whole uni-

verse single-handed in those days.

Of course there were still crumpled rose-There was Brand, for instance—Brand of the repairing-shop. He was a strenuous worker and an admirable mechanic; but he suffered intermittently from a severe form of the popular disease of the day—the disease which has its roots in our national policy of educating a man sufficiently to make him discontented with his lot, and then leaving off. Brand was a Socialist, or a Revolutionist, or an Anarchist. Philip could never find out which, and the muddled but pertinacious Brand could never enlighten him. The most noticeable feature of his malady was an overcopious supply of what the repairing-shop as a whole termed 'back-chat.' Mr Brand was a stalwart upholder of what he called the dignity of labour. declined to be patronised; he smelt patronage as an Orangeman smells Popery. He also refused to accept an order with any degree of cheerfulness; though, to do him justice, once he had expressed his opinion of the order and the degradation which he incurred in accepting it, he usually carried it out with efficiency and To a man who knows his job almost despatch. anything may be forgiven. We shall hear of Mr Brand again.

Then there was Alfred, the office-boy. He was a stunted but precocious child, with a taste for music of a vibratory nature. He believed firmly in the adage that a merry heart goes all the way, and whistled excruciatingly from dawn till dusk. His tremolo rendering of 'All that I ask is Love' appeared to afford him the maximum of human enjoyment. The departure of Mr Atherton involved him in some financial loss, for he had been employed by that ardent sportsman to execute turf commissions on his behalf with an unostentatious individual who conducted his business in the private ber of an unassuming house of call in Wardour Street. Consequently he considered it only just to make things unpleasant for the new manager. This object he accomplished in divers ways, which will be obvious to any schoolboy. suffered in silence, for he was disinclined for further dismissals, and, moreover, could not help liking the impudent youth. His patience was rewarded, for one day, with incredible suddenness, the nuisance ceased, and Master Alfred became almost demonstrative in his assiduity and doglike in his affection. Presently the mystery was unfolded. Alfred had discovered that that usurper, that tyrant, that slave-driver, Mr Meldrum, was the identical P. Meldrum who had scored the winning try for the Harlequins against Blackheath on the previous Saturday afternoon. One day, after office hours, almost timidly, he approached his employer and presented a petition from his own club, the Willesden Green Vampires, humbly praying that the great Meldrum would honour this unique brotherhood by consenting to become one of its vice-presidents. Philip's heart warmed at the compliment, and he complied gladly. He achieved further and lasting popularity among the Vampires of Willesden Green by officiating as referee in their annual encounter with the Stoke Newington Hornets. the road to the heart of healthy young manhood is marked in plain figures.

A third, and by no means unattractive, rose-leaf was Miss Jennings, the typist. She troubled Philip considerably at first. He found her presence disturbing. To him it seemed fundamentally wrong that a man should sit in a room with his hat on while a young and lady-like girl stood waiting at his elbow for orders. He endeavoured to remedy these anomalies by removing his hat in Miss Jennings' presence, and rising from his seat whenever she entered his private room—courtesies which his typist secretly regarded as due to weakness of intellect rather than the instinct of chivalry, though she valued them in her heart none the less.

It was a long time, too, before Philip grew accustomed to dictating letters. His first incursion into this enterprise gave him an uncomfortable quarter of an hour. He began by ringing for Alfred, and asking him to request Miss Jennings to be so good as to come and speak to him for a moment. His message was delivered by that youthful humorist with elaborate ceremony—this was in the pre-Willesden Green days—coupled with a confident assurance that it portended either a proposal of marriage or 'the sack.' Miss Jennings' reply Philip did not catch, for only Alfred's raucous deliverances could penetrate closed doors; but it effectually silenced that young gentleman's guns. His only discernible retort was 'Suffragette!'

Presently Miss Jennings appeared, slightly flushed, and shut the door behind her.

'You want me, Mr Meldrum?' she asked. Philip rose to his feet.

'Yes. Would you mind taking down one or

two letters for me, Miss Jennings?' he said.
'Oh, is that all?' replied Miss Jennings, quite composed again. 'Mr Atherton usually just shouts. I'll go and get my things.

She returned with her writing-pad, and, taking a chair at Philip's elbow, sat down and regarded him with an indulgent smile.

Philip began huskily, 'The Britannia Motor Limited, Oxford Street, London. Company, Thursday, October '-

Miss Jennings sat patiently waiting. 'I know that bit,' she intimated gently.

Philip apologised, and continued hurriedly, 'DEAR SIR. No; I expect you know that bit

'That bit's all right,' said Miss Jennings 'I wasn't to know who you were writing to. It might have been your wife.'

Philip-who had not hitherto realised that it was possible for a man to correspond with the wife of his bosom by means of a machine operated by a third party—apologised again, and added quite gratuitously that he was not married.

Miss Jennings, having secured the information she required, smiled forgivingly, and the dictation proceeded.

'We are in receipt of your letter of October the fourteenth.

'They usually say "esteemed communica-

tion,"' said Miss Jennings. 'Thank you,' said Philip humbly. 'Please correct it.' Miss Jennings did so. Philip, 'Please

regarding the curved neck and prettily coiled hair close beside him, found himself wondering why such a beautiful thing as a young girl should be compelled to work for a living. It seemed all wrong, somehow.

Miss Jennings looked up, and caught his eye. 'Well?' she inquired shortly.

Philip coloured guiltily, and continued, 'The cylinders you mention are cast in pairs, and their internal diameter is one hundred millimètres,

He paused again. It seemed to him monstrous that Miss Jennings should waste her youth taking down dry technical stuff like this, when she ought to be outside in the sunshine. If a woman must earn her bread, at least let her do work that was woman's work and not man's leavings. A woman should stand apart from the struggle for existence, rendering first aid to her man when he was stricken and companionship when he was weary. But to sit-

Miss Jennings looked up again. 'We can go faster than this,' she observed severely. 'I'm a

trained stenographer.

Philip, collecting himself, dictated an elaborate formula for ascertaining the indicated horsepower of the engine under discussion at a pace which caused the trained stenographer to pant for breath. When he had finished, he said, 'There are two more letters to do, Miss Jennings, but perhaps you would like to rest for a moment?'

'No, thank you,' said Miss Jennings. 'I'm

not made of sugar.

Possibly this statement was made—as many feminine statements of the kind are made—in order to be contradicted. More probably it was intended as a test of character. Whatever it was, it failed to intrigue Philip.

'Very well, then,' he said, and proceeded to

dictate another letter.

'Of course I see how it is, Mr Meldrum,' said Miss Jennings, unbending a little as their joint task came to an end. 'You have not been accustomed to working with a woman, and you think she can't work the same as a man. You'll soon find out your mistake. She works twice as hard, and makes less fuss about it.'

'I am sure she does,' said Philip meekly.

'It's kind of you,' proceeded Miss Jennings maternally, 'to consider my feelings; but we shall get through a great deal more work if you look on me simply as a machine.'

'I do not think that would be possible,' objected Philip. 'I could not do my own work properly if I thought you were not comfortable.'

For a moment Miss Jennings eyed her em-

ployer keenly.

'Well, try, anyway,' she urged. Experience had taught her to beware of gentlemen who were too solicitous about her comfort, and she had not yet taken Philip's complete measure. 'I've been earning my living for five years now—ever since I was sixteen,' she added carelessly-'and I have found that we do our work better and are much more friendly and comfortable when the gentleman I am working for doesn't worry too much about whether I want a cushion for my back, and that sort of thing.'

'I see you are an independent lady,' said

Philip, smiling.

'Independent? Yes, that's me,' agreed Miss Jennings. 'You wouldn't take me for a Suffragette, though, would you?' she added, with a tinge of anxiety in her voice.

'I don't think I have ever met one.'

'Well, go to one of their meetings—the Park on Sunday, or somewhere—and you won't want to meet one twice,' said Miss Jennings. 'What they 're to gain by it all beats me, let alone the show they make of themselves. A woman has enough trouble coming to her in life without going out in a procession and asking for it. That's how I look at it. Well, I'll go and type these letters.'

Miss Jennings' presence gradually ceased to affect Philip's powers of concentration, and he soon dropped into the habit of regarding her as she had asked to be regarded—namely, as part of the office furniture—though he always treated her with scrupulous courtesy, and persisted in certain small acts of consideration not usually offered to articles of upholstery. Miss Jennings, finding that her defensive attitude was entirely unnecessary, promptly set out with the perversity of her sex-or perhaps quite unconsciously-to stimulate her employer's interest in her. It was a pleasant and quite innocuous diversion, for Philip was usually far too busy to take notice of her little coquetries, and had far too much regard for the sanctity of the unprotected female to respond to them if he did.

He had grown so accustomed to regarding his typist as a mechanical adjunct to the office type-writer that he suffered a mild shock when one day Miss Jennings remarked, 'So Mr Atherton's gone? Well, he was no more use than nothing in the office; but he wasn't a bad sort—not if you took him the right way and kept him in his

place.'

'He was a friend of yours, then?' said Philip.

'Well, he used to take me out sometimes.'

'Where to?

'Oh, the White City, or a theatre. It's a nice change to be taken out by a gentleman sometimes. When you go by yourself or with your sister,' explained Miss Jennings, 'you go in the pit. When any one like Mr Atherton took me, it was reserved seats and dinner somewhere first. I love the theatre. Don't you?'

'I don't go very often,' confessed Philip.

'Why not?'

'I don't know. Too much trouble to turn

out, I suppose.'

Miss Jennings collected her papers and rose. 'Well, I must finish these,' she said. 'Will there be anything more this morning, Mr Meldrum?'

'Thank you, that is all.'

Philip surveyed the retreating form of Miss Jennings with thoughtful eyes, and his heart smote him. By evicting the incapable Mr Atherton he had deprived this plucky, chirpy little city sparrow of one of her most cherished recreations. 'Oh, Miss Jennings!' he said nervously.

Miss Jennings turned.

'Would you care to come to the theatre with me?'

Miss Jennings' slightly anæmic features broke into a frank smile. 'It's no good my pretending I don't want to go to the theatre when I do,' she remarked; 'so why not say so? Where shall we go?'

'Anywhere you please.'

'When?'

'To-night, if you like.'

Miss Jennings considered. 'I must see if my sister's to be at home,' she said. 'There are just two of us, and one always stays in of an evening with mother. May I use the telephone? My sister is with Goswell Brothers, in Finsbury Circus.'

'Certainly,' said Philip.

Miss Jennings sat down at the roll-top desk and took the receiver off the hook. She flatly declined to accept the assurance of the operator at the exchange that the number she required (1) was out of order, (2) engaged, (3) had not replied; and in the incredible space of four minutes succeeded in establishing telephonic communication with a place of business situated almost a mile away. A much briefer but equally decisive encounter with the Finsbury Circus office-boy ended with the production of Miss Jennings' sister, who was forthwith addressed: 'That you, May dear?'

T'ck, t'ck, replied the instrument.

'I want to go out to-night. Can you stay in with mother, or are you doing anything?'

Apparently the reply was satisfactory, for Miss Jennings turned to Philip. 'That will be

all right, Mr Meldrum,' she said.

They dined at Gatti's, and went on to a musical comedy. Philip dropped readily into the etiquette of the Amphitheatre Stalls, and provided Miss Jennings with chocolates and lemon squashes during the interval. Half-way through the second act he decided that this was the pleasantest evening he had spent since he came to London. What Miss Jennings thought of it all he did not know, for she did not tell him. Having speared her hat to the back of the seat in front, and dabbed her hair into position, she sat absolutely silent, with her eyes fixed unwinkingly upon the stage. For the time her perpetual companion, the typewriter, was forgotten, and she lived and moved in the world of romance, where ladies were always fair and gentlemen either gallant or entertaining. Occasionally, without removing her gaze, she would call her host's attention, by a half-unconscious gesture, to some particularly attractive item of the entertainment.

When all was over she sighed resignedly and preceded Philip out into the roaring Strand. Philip, scanning the street for a disengaged cab, asked her where she lived. Miss Jennings gave him an address in Balham.

'We had better walk down to the Embank-

ment,' he said. 'We might pick up a taxi or a hansom outside the Savoy.'

Miss Jennings murmured something perfunctorily about the facilities offered to the public by the London General Omnibus Company, and then accompanied him to the Embankment.

Presently a hansom was secured, and Philip handed his guest in, at the same time furtively paying the driver.

'Good-night,' said Miss Jennings, 'and thank

you.'

They shook hands, for the first time in their acquaintanceship. The cabman and his horse, however, did not know this, and immediately feigned a studious interest in something on the Surrey side of the river.

Philip walked home, and let himself into his dark and silent flat. On turning up the light

he found that the lady who 'did' for him had omitted to clear the breakfast-table. He accordingly set to work to wash-up himself, knowing full well that the task would be even less congenial to-morrow morning.

As he groped philosophically in his tiny pantry for a dish-cloth it occurred to him that to a lonely man female society is a very helpful thing. And he was right. For it is so helpful that, though a man may, and often does, exist contentedly enough without it, once he has tasted thereof he must have it always, or feel for ever helpless. And yet, every day, refined young women are surprised, and shocked, and indignant when a brother in London suddenly telegraphs home to say that he has married a girl out of a tea-shop.

(Continued on page 309.)

DEAF HUMANITY.

APART from those who have given special study to the subject, very few people realise the appalling prevalence of deafness in Great Britain to-day. At the census of 1911, for the first time, it was made compulsory to enter the particular infirmity on the return; but unfortunately the question relating to deafness was so framed on the paper that the resulting figures are of little practical value. Only total deafness was dealt with, whereas the great mass of deafness falls short of the entire loss of hearing. It is to be hoped that the next census papers issued will be designed in an improved form. Meanwhile, by sifting the returns published annually by the special hospitals, and by means of other deductions, we know that it will be fairly safe to estimate the extent of deafness as being 6 per cent. of the total population. If, in order to make out a perfectly safe estimate, we place the figures as being 4 per cent. -which, perhaps, is really an underestimatewe get one million eight hundred and eight thousand six hundred and sixty-six persons as the proportion of deaf humanity in the United Kingdom's total population of forty-five million two hundred and sixteen thousand six hundred and sixty-five. In England and Wales we find the proportion to be one million four hundred and forty-two thousand eight hundred and nineteen; while in London alone it is one hundred and eighty thousand nine hundred and eighteen. When we remember that the bulk of deafness is cumulative-in other words, that a huge percentage of it is not curable-and when we consider the crippling effect of a total or partial, but definite, lack of hearing-power, we are forced to regard the existing amount of deafness as a very disturbing element. It should be noted that our estimate relates to definite deafnessthat is to say, a degree of deafness such as to

handicap the victim; it does not apply to the totally deaf only, and, on the other hand, it does not include the merely 'hard of hearing.'

Deafness has little respect for persons, and to some degree it selects its victims impartially. The crowned head, the statesman, men and women of rank and fashion, the doctor, soldier, lawyer, journalist, merchant, and clerk are alike overtaken by deafness, hardly less than are the mechanic, the factory-hand, the field-labourer, and the odd jobber; and while there is the dimmed hearing of old age, there is likewise the loss of hearing that falls on the babe still at the breast or on the child in life's very early morning.

Hearing is lost as an effect of a cause varying in individual cases; in itself the loss is not a But—and it is herein that tragedy disease. has its dwelling-place—a very large percentage of deafness is easily preventable, and it would be prevented if only the nature of the ear and its function were more widely known, so that at the earliest hint of trouble due precautions might be taken. Catarrh undoubtedly accounts for many victims to deafness; it has been suggested that fully 80 per cent. of all deafness arises from this cause. This is probably an inflated estimate; but it will be fair to place at least 50 per cent. of our deaf population to the The humid and changeable debit of catarrh. climate of these islands renders us all liable to colds, and only the most robust escape. catch cold upon cold, and, ignorant of the danger, we do not set to work patiently to remove the trouble. Chronic catarrh then results, and, given its head, in time it becomes established in the middle ear. Deafness follows, and it is often deafness of the most obstinate type, demanding the utmost skill and patience in the treatment.

Meningitis, scarlet-fever, scarlatina, measles,

and syphilis are all prolific causes of deafness. In the past neglected adenoid growths in children accounted for a by no means small amount of deafness; but the advent of the school doctor most probably means the removal of this cause. There is, too, the loss of hearing which may arise from occupation. 'Boilermakers' deafness' occurs in a startlingly large proportion of those engaged in engineering and allied trades.

Only the deaf themselves can appreciate to the full the meaning of deafness, for it is a thing one must actually experience in order to comprehend its bitter import. The face of Beethoven, as seen in some of his busts and portraits, depicts the grief of deafness. The 'deaf' face is always characteristic. To the professional man, a perceptible impairment of hearing-power invariably means exit from his profession, sometimes his complete ruin. To men and women accustomed to place and part in society, deafness is a mandate of exile from haunts of brightness; to some stoic souls it spells the pain of being on the scene yet not of the scene. To the working-man it may often mean the choice of three alternativesstarvation, the workhouse, or suicide. Not a few men have decided for the last-named.

How shall we tell what absence of hearing is to the tiny child? On all this big stage of life there moves no more poignant figure than that of the child minus its hearing. From start to finish it is fated to be the weight-bearer in every race. Its education will probably cost at least three times that of the average normal child, and in the end the result will be nowise similar in the majority of cases. The deaf child represents the handicap of deafness in its heaviest and hardest aspect.

To women more often than not deafness is just the closing door on the dearest hope of normal womanhood, for it is condemnation to a life spent alone. To the woman who becomes deaf after marriage, absence of hearing can be the supreme stab day after day. If she be a mother, there is the barrier between herself and her children in all the years that must elapse before the latter are old enough to overcome the mother's deafness; and it is just in these early years that a mother most needs her hearing, and that it is most vital there should be free communication between herself and her children. In the business world the chance of the deaf woman is practically nil, and in the labour market her position is at best precarious.

These pictures of deafness are not overdrawn; they are just sober realities taken from actual life.

The inner life of the deaf is not that domain

of peaceful silence which most people erroneously imagine it to be. When hearing goes out, in nine cases out of ten tinnitus, or a ringing in the ears, steps in. From the enjoyment of normal hearing many sufferers pass to a state of oblivion to ordinary sounds, but at the same time they enter a pandemonium of noise. In the deaf man's ears, or rather in his head, drums beat, whistles shrick piercingly, bells ring, or voices drone ceaselessly. Sometimes tinnitus becomes so unbearable that only the use of a nepenthe saves the victim's reason; numerous deaf people use drugs habitually in order to obtain relief from 'noise storms,' and the majority say that they could bear the loss of hearing, hard though it be, were it not for the concomitant state of eternal wild noise.

In and around Harley Street are between fifty and sixty highly skilled surgeons who specialise in diseases of the ear and deafness. Most of them are in busy practice. In London we have five special hospitals, and all the big general hospitals possess departments for the treatment of ear disorders. How, then, are we to account for the mass of unrelieved deafness present with us to-day, and increasing month by month? There is one great root reason that goes to explain this apparent puzzle. The majority of people in free enjoyment of the five senses take them as a matter of course. Few trouble to train all five; most train only those employed specially in occupations or hobbies. There is on record an authentic case in which a man, on awaking one morning, by some accidental means discovered that he had completely lost the sight of one eye. When he hurried to a specialist, and the eye had been examined, he was assured that for at least two years he had been blind in that eye. It is much the same with the hearing. It may fail by such gentle degrees that its passing is unnoticed until there is great loss, and very serious changes have taken place in the When deafness becomes too hearing apparatus. patent to be overlooked any longer, and skilled advice is sought, matters have gone so far that cure can be wrought only by prolonged treatment, or it is out of the question, and the patient in this latter dismal event may be judged lucky if the progress of deafness be arrested. The fine mechanism of hearing being deeply hidden in the head, the work of the aurist is rendered the most difficult in all the realm of the healing art. When he gets the case perhaps a year too late, to expect him to cure deafness is to expect the impossible. Briefly, most of us consult the specialist too late, and we pay the severe price of delay.

MISS PETERSEN TAKES CHARGE.

CHAPTER II.

MOLLY slipped on a hat and coat and ran to the bicycle-shed. 'How lucky it is that I had those new tires put on!' she said to herself as she lit the lamp. A minute afterwards she was pedalling swiftly down the road, knowing that John Stranger would stop at Greenwich Pier to pick up the man and boy who completed his crew. And she smiled to herself, in spite of her anxiety, at the anticipation of his surprise.

Now was the time for old Petersen's daughter to show that she possessed some of old Petersen's grit. She flew on, reckless, taking every risk, heedless of the astonished glances of those, awheel or afoot, who saw her dash by. Greasy tramlines, roaring cars, erratic cabs, and dark crossturnings, all were taken at top speed, without pause or reflection. At last she whirled into the road by the college, and at the same time she discovered that her lamp was out. A burly policeman stepped before her. She dodged him with extended elbow. He fell back, gasping. Molly bent forward for one last, desperate spurt.

She dashed up to the pier entrance and leapt off headlong. The bicycle crashed on into the wood building. She let it go. In a moment she was through the turnstiles and running madly

down to the pier.

She heard the hoarse blowing of a steam-valve, and the sound forced a little gasping sob from her lips. But she set her teeth and ran on. When she had got on to the pier she could see a tug, already moving, just under way. 'Jack!' she cried wildly. 'Jack!'

The tug was turning outward; the stern-spring had been cast off, but the pier rails were still down. Molly made a wild resolve. Gathering herself together, she ran to the edge of the pier, and, shutting her eyes, jumped with all her

might for the tug.

She fell, not, as she had half-expected, into the black, cold water, or upon the hard edge of the *Coronation's* stern combing, but into a pair of strong supporting arms, which drew her forward and upward, and gave her a wonderful sense of security and strength.

'Jack!' she murmured. 'Oh Jack, is it you?'
'Who else?' said Jack calmly, as if this sort
of thing were an every-night happening with

Molly began to laugh hysterically.

Jack placed her on a coiled rope and wisely said nothing. But while she struggled for self-mastery he looked up at the mate, who had sprung to the wheel when he left it to catch Molly. 'Put back to the pier,' he said.

'Ay, ay, sir,' replied the man. 'Sirs' are not very plentiful among tug-boat crews; but most men, somehow, said 'sir' to John Stranger.

Molly heard the order, however, and it brought her to herself again. 'No, no!' she cried. 'Go on!'

'Carry on,' said John Stranger imperturbably, 'to Tilbury.'

'Ay, ay, sir,' said the mate.

Then, as the telegraph rang and the tug ploughed out into mid-stream, Molly Petersen told her story.

John Stranger heard her to the end without comment. Then he pulled out a crumpled piece of paper from his pocket. 'Let's look at the wire,' he said. He fetched a lantern, and they straightened out the telegram. 'Seven-fifty it is,' he said reflectively. 'Umph!' He took a half-charged pipe from his pocket, lit up, and puffed away, deep in thought.

Molly watched him, anxious, yet amused at his preoccupation. Then she put her arm through his coaxingly. 'Well, sir,' she said, 'what is the

result?'

John Stranger started, and looked down at her with an ashamed air. 'I—er—I beg your pardon for being such a boor,' he said. 'What do you think yourself, dearie?'

Molly reflected for a moment. 'You see, I'm only a girl,' she said slowly, 'and they say women always jump to conclusions. But I believe it's all a plot, and the people who broke into the office knew dad was going to Hamburg soon, and sent the telegram themselves.'

'Hoping to get away in my boat with their plunder, added Stranger. 'A woman's intuition, Molly, is every whit as good as a man's reasoning

any day.

'It's so comforting to know that you agree with me,' said Molly, who was quickly recovering her usual spirits. 'But what are we going to do?' she added more soberly.

'Catch 'em in their own trap,' said Stranger.
Molly clapped her hands. 'Lovely!' she
cried. 'And won't dad be pleased! Poor old
dad!'

'We shall have to go a bit careful, though,' said Stranger. 'We might be wrong, and it wouldn't do to make a mistake. Now how can we make sure?'

Both fell silent, thinking.

Suddenly Molly emitted a gurgle of delight. 'I've got it,' she cried. 'You know the little fore-cabin just in front of the saloon. I'll hide in that. They're certain to go down into the saloon, and there's sure to be a crack or something through which I can hear what they're talking about.'

'Good,' said Stranger. 'There's only one little improvement to make in your scheme. Mr Petersen intended that there should be no

eavesdropping in those cabins. They're built as a ship should be. But it won't take me long to drill a hole through the bulkhead behind one of the pictures; and then you'll be able to hear.'
'Hurrah!' cried Molly softly. 'You and I,

Jack, against the world.

Molly sat in the lee of the wheelhouse, wrapped in a thick duffle coat, while John Stranger quietly made his preparations. He said nothing to the crew beyond a casual remark to the mate to the effect that Miss Petersen had come on board, with an urgent message, to meet her father at Tilbury.

Presently Molly saw Stranger's tall figure coming aft. He stopped to speak to the mate at the wheel, and then came across to her.

'Everything is ready,' said Jack.

they won't be too sleepy to talk.'

'Are you going to take the wheel?' asked Molly.

'Not till we get near Tilbury. Wallis won't mind.'

It was a beautiful starlit night, and the dark, ever-widening river, with the reflection of lights on the waters, and the dim, mysterious shapes which the darkness gave to the buildings ashore, had a peculiar charm which only those who have seen them can appreciate. Both the girl and the man gave a sigh of regret as the lights of Gravesend came in sight. With a clasp of the hands the two parted, Molly to her post and John Stranger to the wheel.

The Coronation was punctual. She had hardly made fast when the rumble of the midnight train could be heard in the distance.

A pier-hand turned out sleepily and hailed Stranger. The Coronation was well known at

Tilbury. 'Gov'nor comin' down to-night, sir?'
'Expecting him, Sam. Nice time o' night to

set out, isn't it?'

'Ye're right. But 'e's a rum un, is old Petersen. I knows 'im.'

The train drew in, and the sound of footsteps came echoing through the iron-roofed gangway. John Stranger, leaning over the side of the wheelhouse, gave a glance forward, where Molly's head just showed above the fore-cabin hatch. he turned to see what the train had brought.

Three men, each carrying a good-sized bag, stepped out upon the dimly lit pier. They hesitated and looked round irresolutely, as men might do who were strangers and not sure of their ground. Then one of them apparently caught sight of the pier-hand, who was leaning, hands in pockets, against a pile, surlily resentful of these disturbers of the night.

Er-my man, can you show me a tug called the Coronation?

Sam looked the speaker up and down, and a grin spread slowly over his grizzled features. But he made no change in his attitude of repose. 'Mebbe I could. She ain't what you'd call fur from 'ere.'

The other caught him up sharply. 'I'll give you half-a-crown to take me to her as quickly as possible.

Sam's grin deepened, and John Stranger, who had overheard the conversation, began to smile

Sam took a horny hand from one pocket and held it out. 'Gimme the 'arf-dollar,' he said.

The stranger handed over the coin without hesitation.

Sam took it, bit it, spat on it for luck, and sauntered down toward the pier-edge. 'There y'are, sir,' he said, stepping aside and jerking his thumb at the Coronation, lying about two yards distant from him. 'I said she warn't fur away.'

The man who acted as spokesman for his party started. By the flickering light of the solitary pier-lamp John Stranger could see the expression on his face; and if looks could have harmed the stolid, chuckling Sam, he would have been a fit subject for the hospital.

But when the new-comer, having discovered Stranger, addressed him, his voice was ingratiatingly smooth and polite. 'Are you the captain of Mr Petersen's boat, the Coronation?

Yes, sir.

'I must introduce myself and explain. My name's Martin-Oliver Martin. I am a friend of Mr Petersen's, and so are these two gentle-He had arranged to take us with him to Hamburg, but at the last moment urgent business cropped up to prevent him. However, in order not to disappoint us and upset our arrangements, he very kindly offered us the use of his boat, although he couldn't go himself. And we have accepted the offer.' Mr Oliver Martin paused.

Then John Stranger seized his opportunity. 'But, sir,' he said hesitatingly, with a well-assumed slowness of perception, 'begging your pardon, I've heard nothing from him, except his

telegram.'

'Yes, yes, my good fellow; quite so. And you naturally wish to have some message from Mr Petersen to convince you of our good faith. He saw that too; and as he was stopped only just before the train left Fenchurch Street, and had no time to write, he sent you this ring. Do you recognise it?'

John Stranger took the ring held out to him -a massive gold signet ring; and his fingers itched to be at the throat of the giver. For he recognised it well enough; and he was certain now that the other had taken it, not courteously from a friendly hand in Fenchurch Street Station at ten minutes past eleven, but roughly and brutally from insensible fingers in Great River Street some time before half-past seven. need now for Molly to play the spy; further evidence was unnecessary.

However, John Stranger curbed his feelings, and handed the ring carefully back to the impostor. 'Yes, sir,' he said quietly, 'it's Mr Petersen's ring right enough. Will you and these other gentlemen come on board, and I'll get under way at once?'

'Nothing will suit us better,' said the man who

called himself Martin, with alacrity.

'And that's the truth, anyway,' thought Stranger grimly, as he called out for the fore-

spring to be let go.

Mr Martin and his two companions stood by, watching operations. Out of the tail of his eye, Stranger, as the tug moved off, saw the firstnamed slap one of the others on the back with much cordiality, and the skipper smiled more grimly than ever.

When Gravesend was well astern and the Coronation fairly under way, he turned the wheel over to Wallis, and went down on deck.

'Would you like to see the saloon, sir?'

'Yes, we should—eh, Fenton?'
'This way, sir.' Stranger led the way to the companion. 'Bit dark here, sir,' he commented as he went down the short flight of steps. 'But,' he went on, opening the saloon door, 'you'll find a light ready, and all warm and snug inside.

The three passengers went in. The door was closed, and Stranger, listening in the darkness, heard the bolt quietly slipped. Then, with a cheerful smile, he picked up a broad iron bar, and dropped it softly into the sockets which he had prepared.

'Two can play at that game,' he said to himself as he tested his contrivance to make sure all was fast; and, humming a little tune, he went up on deck, and so to the fore-hatch.

'Molly!' he called softly—'Molly!' and gave

a low whistle.

A figure came silently up the perpendicular ladder. 'Oh Jack, why did you call me? They were just beginning.

'It's all right,' replied Stranger. 'There's no

need to find out any more.'

'Why, what has happened?'

'Did Mr Petersen have his signet ring on

when he was brought home?'
Molly reflected. 'No,' she said after a moment, 'I believe he hadn't; I'm sure he hadn't. Why do you ask ?

John Stranger explained.

Molly Petersen clenched her little hands, and her eyes blazed. 'Oh the beasts!' she cried in a whisper; 'the—the—beasts /'

'Well, the beasts are safely caged now,' said Stranger cheerfully; 'and it isn't far to

The mate looked somewhat astonished at the sudden putting back, but he obeyed orders promptly. John Stranger moved over near by the companion.

The low hum of conversation below suddenly ceased as the tug began to manœuvre round. The two on deck heard the sharp snap of the bolt on the saloon door as it was shot back. Excited voices rose from below. Then came another interval of silence. The prisoners were evidently puzzled, perhaps looking for some other means of escape. Then came loud shouts, and the sound of furious blows on the barred door.

'Supposing they break it open?' whispered

Molly.

John Stranger showed her the end of a 'But they won't,' he said. revolver.

Dick, the deck-hand, and Billy, the boy, came up, all agog with curiosity; and the mate would have given his shirt to be able to leave the wheel.

'Stand clear and look to your job,' ordered the skipper peremptorily. 'We're going to stop at Gravesend, and you'll hear all about it then. -Dick!'

'Yessir.'

'Let off a police flare. You'll find one ready in the locker.

The noise in the saloon had ceased, the trapped occupants apparently realising the futility of their efforts to force the door. As the Coronation, going dead slow, came near Gravesend pier, the flare blazed out, lighting up the water around.

Billy the boy came up to Stranger excitedly. 'Please, sir, one of 'em's got 'is 'ead out of the

Stranger whispered a few instructions. The boy doubled off, and returned with a bucket. He moved along the gunwale some little way, and stopped and looked over gingerly. Then he glanced back at the skipper.

Stranger nodded. Up went the bucket and

over the side went the contents.

A yell of dismay and rage came from below; and on it followed the mate's voice, 'Police boat comin' alongside, sir.'

'Good-evening, inspector,' said John Stranger, leaning over the side. 'Have you heard of the assault and robbery in Great River Street?'

'Funny thing you should ask me that, Mr Stranger. I've just had a telephone message about it.

'Well, the men who did it are down below. Come along on board.'

The business is now Petersen, Stranger, & Co. And on board the Coronation old Petersen is never tired of telling his two grandchildren the ever-fresh story of 'how mummy took charge.'

THE END.

HOBART: THE FUTURE DEEP-WATER PORT OF THE AUSTRALIAN COMMONWEALTH.

By F. A. W. GISBORNE, New Town, Tasmania.

IN Chambers's Journal for November 1912 there appeared an article entitled 'Two Beautiful Harbours—Sydney and Rio.' It is proposed in the following remarks to give a brief description of a third, which, while rivalling in natural beauty the two just named, may be regarded as excelling both in suitability for the purposes of commerce. The harbour referred to is that of Hobart, the capital of Tasmania, which lies on the magnificent estuary of the river Derwent, chout ten miles from its mouth.

The attractions of Port Jackson from the scenic point of view may readily be conceded; and the perfect shelter it affords, the extent of its surface when all the tributary coves and ramifications are taken together, and the ease with which, by suitable vessels, the entrance can be navigated, entitle Sydney Harbour to a high place among the world's havens. But, nevertheless, it labours under two increasing, and most competent judges think irremediable, disadvantages. The main waterway from the entrance to the principal wharves is dangerously narrow for a great commercial harbour; and, with expanding traffic, there must be an everincreasing danger of collisions between outgoing and incoming vessels. The second disadvantage is even more serious, for it lies in an insufficient depth of water. Not very long ago the Sydney Harbour Commissioners stated officially that no vessel drawing more than twenty-eight feet of water could leave the port at low tide. ship of deepest draught yet built, the Baltic, when fully loaded, draws thirty-eight and a half feet of water, and vessels of yet deeper draught are sure to be built erelong. The obstruction across the entrance of Port Jackson, known by the unromantic name of the Sow and Pigs Reef, would alone cost, according to an authoritative estimate, over two million pounds to remove; and experts who have carefully studied the question state that the completion of such a work would probably prove a disastrous mistake, as a general shoaling of the harbour-mouth would most likely ensue. When a heavy swell prevails, shipmasters whose vessels draw over twenty-four feet of water are advised not to attempt the passage at low tide, there being grave danger of vessels of deeper draught bumping between the rollers. Lloyd's Register of Shipping (1909-10) gives the depth of water at the entrance to Sydney Harbour as twenty-seven feet at low tide, and thirty-one feet at high tide; while along Circular Quay, the chief line of berths for ocean-going vessels, the depth varies from a minimum of twenty-six to a maximum of twenty-nine feet. These measurements, together with the greatly restricted space for turning and manœuvring in the main channel of the harbour, do not support the view that Port Jackson can ever become the deepwater port of the Commonwealth of Australia. It has, in fact, already fallen behind the times, and is inaccessible to the largest vessels that now visit the Antipodes. For the requirements of the huge leviathans now built or being built for the Australian trade, another harbour of greater depth and commodiousness must be found.

Such a harbour, in the fullest sense, is that adjacent to the city of Hobart. Practically landlocked, of great extent, absolutely safe in all weathers, free from island, shoal, or impediment of any kind, and affording throughout perfect anchorage, the harbour has certainly no superior, and few equals, in the world. From the entrance of the Derwent to the Hobert wharves the distance is rather over ten miles. The estuary for the whole way averages about three miles in width, excluding the very ex-tensive arm known as Ralph's Bay, which in itself is a large harbour. The central channel, about a mile and a half wide throughout, is in no place less than fifty feet deep, and averages probably about sixty. Thus abundance of space is afforded for all the ordinary movements of shipping, and an enormous traffic could be carried on without any congestion. A narrower, but equally deep, waterway extends up the estuary for some ten miles farther.

In regard to berthing accommodation for shipping, the King's Pier, seven hundred feet long, has a depth of water alongside varying from a minimum of thirty-four feet to a maximum of forty-five feet at low tide. A companion structure known as Queen's Pier, five hundred and fiftynine feet in length, can be used by vessels drawing from thirty to forty feet of water; and Prince's Wharf, twelve hundred and ninety-two feet long, can accommodate vessels of a similar kind throughout its entire length. But a new pier is now being built, which when completed will be over twelve hundred feet long, and, commencing in a depth of thirty-four feet, will end in water not less than sixty-two feet deep at low tide. No vessel is ever likely to be built which will find an inadequacy of water here; as it is, the largest steamers now affoat could lie at the existing piers near Hobart. Yet this is by no means all. An elaborate scheme of harbour improvement has just been adopted by the local Marine Board which will entail the successive construction of four new piers of similar dimensions-the width of each, like that now being built, will be sixty feet, so as to afford ample space for the erection of commodious storage, landing, and transport conveniences—as well as a new wharf four hundred and sixty feet long, a dock, and other facilities. When it is remembered that Sydney has only two thousand seven hundred and seven feet of wharfage, with a depth of space behind of from thirty to thirty-five feet, and only sufficient water alongside to float what are now vessels of the second class in magnitude, the superior advantages of Hobart as a port are manifest. And in the case of Sydney the limit of accommodation has been reached, the difficulties in the way of deepening the harbour and increasing the wharfage area being practically insuperable. At Hobart, on the other hand, there will always be abundance of both land frontage and depth of water to satisfy the ample requirements of an expanding traffic.

In regard to port charges, a matter of considerable consequence to shipowners, the Tasmanian capital also holds the first position. The dues levied there on shipping are the lowest charged in the whole Commonwealth, and among the lowest in the world. The total imposts on a vessel of eighteen thousand tons net, landing and loading full cargoes, are twenty pounds for pilotage in and out, twenty-five pounds for light dues, and seven pounds ten shillings, the ordinary port charge. The total amount payable, therefore, on such a vessel would be only fifty-two pounds ten shillings. And, needless to add, a port with such magnificent advantages claims the favourable notice of underwriters and marine insurance companies. There has never been a serious accident of any kind to a vessel entering or leaving the harbour during the last half-century. The entrance is well lighted at night, and thick fogs are of very rare occurrence.

Coal, like ordinary cargo, can be taken on board direct from the wharves without costs of lighterage. Local companies can always furnish an adequate supply at a reasonable charge, provided due notice as to requirements has been given beforehand. So far, really good steam coal has not been obtained in large quantities from any Tasmanian mine; but considerable seams are known to exist near deep water at several places in the south of the island; and when sufficient capital shall have been raised to work these, in all probability there will no longer be any need to apply to Newcastle, N.S.W.

Such, in brief, are the substantial advantages possessed by Hobart as a deep-water port. When we consider the relative lack of space, both on land and water, and comparative shallowness in the case of Sydney, and the fact that at Rio large vessels have to lie about two miles off shore and land their cargoes by the agency of lighters, a tedious and costly operation at all times, the supremacy of the Tasmanian over both the Australian and the South American harbour is evident. Along the whole Commonwealth seaboard, Port Darwin in the far north is per-

haps Hobart's chief rival; but the former port lacks alike the perfect security and the commodiousness of the latter. The archipelago of low islands, encircled by dangerous reefs and shoals, that lies off the coast of the Northern Territory in the main path of shipping bound from Torres Strait to Port Darwin, and, it may be added, the utter inadequacy of the arrangements for lighting the coast, render navigation in these waters very hazardous. An intelligent sea-cook, on the other hand, could bring a vessel into the Derwent with perfect safety either by night or day.

night or day. In regard to scenic attractions, the respective surroundings of the three ports, the tropical, the sub-tropical, and the temperate, are so different from one another that comparison is almost impossible. Probably Rio, with its island gems, the glory of its surrounding tropical vegetation, and its majestic mountain background, deserves the first place. But at and around Hobart the three essential components of perfect scenerymountain, water, and forest—are all represented. Mount Wellington, with its wooded slopes, abruptly terminating near the summit in bold, fluted, basaltic cliffs, and rising to a height slightly exceeding that of Scottish Ben Nevis, stands directly behind the city, and forms an imposing figure in the landscape. When seen on a clear winter morning, capped with snow and partly robed in coils of fleecy mist, it is particularly beautiful. Low, rounded, forest-clad hills, with the red roofs of houses here and there discernible among the trees, rise along the opposite shore; and between and extending away seaward to the northern extremity of Bruni Island stretches the broad expanse of the estuary, as much a source of joy to the yachtsman as of safety to the mariner. The long, winding channel known as D'Entrecasteaux Strait—some people now call it the English Channel, owing to the large number of English immigrants who have lately settled on its shores to engage in fruit-growing, &c.-forms a kind of outer harbour about twenty miles in length and three or four in average width; while near its southern entrance the sister estuary of the Huon River penetrates far into the land. Twelve miles from the mouth of this splendid natural harbour, a private jetty owned by a large timber company enables, at all tides, vessels drawing up to thirty-five feet of water to take in or discharge cargo—vessels, in fact, which no Australian harbour could accommodate; and another twenty feet might be obtained by a short extension. Indeed, the Derwent, the Huon, and the lovely sheltered inlet known as

The present writer is, of course, quite familiar with Sydney Harbour, which he has frequently visited; and he is tempted to say, with becoming

Port Esperance, a few miles farther south, form a group of natural harbours probably not to be

equalled elsewhere in the world along a similar

length of coast.

humility, that both its economic and its æsthetic attractions have been somewhat exaggerated. The same spirit of local patriotism which urged an enthusiastic citizen of Melbourne to assure Mr Foster Fraser that the Church of England Cathedral in that city was the finest edifice of its kind in the world prevails largely among the inhabitants of the sister city, whose worship, however, is chiefly bestowed on what they never weary of describing to the patient stranger as 'the most beautiful harbour in the world.' judgment of that stranger, if he is impartial and experienced in travel, does not fully confirm the Sydney Harbour undoubtedly is description. pretty, or charming; but it scarcely deserves to be called, in the full sense of the word, beautiful. Its attractions are largely artificial, being due in a great degree to the extreme tastefulness displayed in the gardens, pleasure-grounds, and villas that adorn its shores. But there is an entire lack of space and grandeur. No imposing eminence is visible anywhere, no real forest can be seen—mere strips of scrubby undergrowth in places along the north shore—and no broad expanse of water soothes and satisfies the eye. Everything is on a small scale; we see not a full landscape, but a mere miniature. And the impression of artificiality is intensified by the swarms of yachts, ferry steamers, and motorlaunches that dart about, suggesting an aquatic Cheapside. The never-ceasing hooting, whistling, and panting of the smaller craft distresses the ear, and the brilliant sky is unpleasantly smudged and darkened by clouds of black smoke. The city itself, too, extending right down to the water's edge, and the long array of large vessels drawn up along the quays, have a displeasing effect. Commercialism is rampant everywhere; there is no repose. A little more rusticity and quietness, and a great deal less art and tumult, would make Sydney Harbour far more delightful to the eye of the lover of nature than it is now.

In reverting to the purely utilitarian side of the subject, a few final words may be said in justification of the title given to this article. The disabilities of Port Jackson as a terminal harbour and distributing centre for the use of the great maritime leviathans of the future have already been demonstrated. Briefly, they may be summarised as want of water, both vertical and superficial. Those of the respective harbours of Melbourne, Brisbane, Fremantle, Adelaide, and Albany are at least equal, and in most cases far greater. The White Star steamer Cufic, though drawing only twenty-eight feet

seven inches of water, actually struck bottom last year when entering Port Phillip Heads; and not one of the ports just mentioned could accommodate a vessel drawing thirty feet. Hobart, therefore, seems to be the destined ocean terminus for the great cargo and passenger carriers engaged in the Australian trade of the future. It may safely be said that a vessel capable of entering any other commercial harbour in the world could navigate the Derwent with ease, and lie at the city piers, where there will soon be over sixty feet of water to sustain them. The fifty-thousand or sixty-thousand ton liner, therefore, in all probability, will tranship at Hobart its freight and passengers—possibly mails also, for a steamer averaging twenty-one knots could reach the city in twenty-four days by the Cape, the time now occupied by the ordinary mail-steamers using the Suez Canal being six days longer-and smaller steamers capable of entering the shallower harbours of Australia would carry these on to their various destinations. Already Hobart is largely used as a distributing centre for immigrants; and last year over five thousand new-comers bound for the eastern states of Australia were landed at the Tasmanian capital from steamers belonging to the White Star and other lines. After discharging their contents the big liners will take on board the Australian produce awaiting them in the commodious sheds and warehouses erected on or near the piers, and then return direct to Europe. Thus the risks of the voyage will be reduced, time saved, and a great economy of money expenditure effected; for, were each consignment delivered by instalments at half-adozen different ports—supposing (an impossible supposition in this case) such ports to exist—pilotage and other charges would be very heavy. Already Hobart is the great naval rendezvous in Commonwealth waters, and, with its adjacent bays and inlets, affords the principal practising and manœuvring grounds for the Australian fleet. Had Admiral Henderson's recommendation been accepted by the Federal Government, the Commonwealth Naval School would have been established there also; but unfortunately the usual ignoble political influences led to the choice of a place far less suitable for the purpose. The natural beauty of the city and its environment attracts each summer thousands of tourists. In times not far distant, there is every reason to believe. Hobart will also be known as the great aorta of Australian maritime trade, and the first landingplace in the Antipodes for hundreds of thousands of the Commonwealth's future citizens.

FEUDALISM AGAINST UDALISM.

A CONFLICT OF LAWS.

By J. G. HAMILTON-GRIERSON.

WHILE it is true, in general, that all heritable property in Scotland is held subject to the laws of the feudal system, whereby the sovereign is accounted the source from which all land-rights flow, yet there are certain exceptions to this rule, to which the term 'allodial'—meaning capable of free and unlimited possession

—is applied.

As the king himself cannot, in the nature of things, own allegiance to any overlord, the patrimonial estate of the Crown, including royal palaces and castles, the superiority reserved from lands granted to subjects, and certain rights called 'regalia'-such as gold and silver mines, salmon-fishings, and the principality of Scotland pertaining to the king's eldest son, as Prince and Steward of Scotland-are not held of any superior. Such, also, is the case of parish churches, churchyards, with manses and glebes, and also lands acquired by companies under statutory authority for the construction of railways and for other public purposes. But the most interesting example of allodial rights is to be found in the survival of the old 'udal tenure' in the islands of Orkney and Shetland.

Until 1469 these islands—the Orcades and Ultima Thule of the ancients—belonged to Norway; but in that year, when James the Third of Scotland married Margaret, daughter of Christian the First of Norway, they were mortgaged to the Scots king in security of the unpaid balance of his wife's dowry; and it is curious to note that to this day Great Britain has right to them only as an unredeemed pledge, which, far from having been discharged, has been again and again declared to be 'unprescribed'

and unprescribable.'

Balfour, in his account of the oppressions of the Orkneys, draws a vivid picture of the sufferings to which this northern appanage of the Scottish Crown has been subjected. 'At various times,' he says, 'they have been granted, revoked, annexed, regranted, confiscated, and reannexed, with wearisome monotony of torturing change. Five times they have been formally annexed to the Crown by Act of Parliament, and fourteen times committed, in defiance of such Acts, and without either protection or redress, to one needy and rapacious courtier after another.' Despite the fact that by statute Orkney and Shetland were to be governed according to their own laws-those of Norway-partly by injustice, partly by increasing intercourse with the mainland, the peculiarities of Norse legislation became less marked, and the islanders' native law-courts, called 'Things,' though especially reserved to them, fell gradually into disuse; and when, in 1748, heritable jurisdictions were abolished, they were forced to have resort to the courts of Scotland. In the same way, it was only by the gradual encroachments of feudalism that the Norse rules of succession fell into abeyance, and primogeniture, whereby the eldest son succeeds, to the exclusion of all others, superseded the ancient mode of distributing a man's estate equally amongst all his children. Yet it is curious that this primitive mode of succession still exists in Scotland where there are only daughters to succeed. They are then called 'heirs-portioners,' and the estate is divided equally among them. There is also a survival of this in the 'gavelkind' of Kent, where there is equal distribution of land amongst sons or brothers.

The agricultural parts of the islands were apportioned amongst the freemen, and held by their possessors, who were called 'odallers,' in free and absolute property; the remainder of the land is property common to all the inhabitants. This division of land, another survival of the old Norse legal system, still holds good; and even yet we find in Scotland and England stretches of country called 'commons,' which are remnants of the old tenure of land which existed all over Europe before the introduction of the feudal system. But while the king is feudal superior of these commons on the mainland, he has no feudal right over those in Orkney and Shetland, which only fall within his jurisdiction in respect

of the sovereignty of the realm.

But udal law is interesting not only from the historical and antiquarian point of view; it has been the subject of fairly recent decisions in the Court of Session. In 1832 it was held that charters granted neither by the Crown nor by a subject deriving right from the Crown had not the effect of feudalising lands in Orkney which had once been held by udal tenure. Four years later Lord Cockburn had a similar question before him; and on the case being reported to the Inner House, it was decided that the lands in question, though dealt with as early as 1665 as if feudal, were not so. Scottish and Norse law again came into conflict in 1890, in the case of Bruce against Smith. Here the proprietor of lands in Shetland claimed that by immemorial custom he was entitled to one-third of the value of all whales captured and killed on the foreshore opposite his lands. The custom had been judicially recognised in 1831 and 1838. The defenders denied the existence of the custom, stating that they had frequently refused to pay. The pursuer admitted the refusals, and also that if payment were made, it was made unwillingly and with grumbling, but only such as usually attended the half-yearly demand for rents. The court decided that, as the custom was neither just nor reasonable, it had not the force of law.

In 1894 there was an interesting case in connection with a claim for a casualty from lands in Shetland held under feudal titles from at least the close of the seventeenth century, subject to an annual payment by way of feuduty. At an early date the pursuer's ancestors had had the superiority of the lands adjudged to them, and in 1857 had obtained a Crown charter; but there was no trace of a Crown title prior to the date of possession of the defender's authors, and no one had ever entered as vassal with any superior. The Lord Ordinary, therefore, repelled the pursuer's claim, holding that the defenders were the first possessors of the land; that, though their title was in feudal form, this was merely for convenience, so that there should be evidence of the right to possess; that the pursuer's later titles created no estate of superiority; and that, as there was thus no vassal, there could be no casualty due.

The latest case on the subject was that of the Lerwick Harbour Trustees against Smith in 1903. Here the court again maintained the prevalence of udal over feudal law, and held that the foreshore, like the rest of the soil of the Shetland Isles, was allodial, and that a title to land including part of the foreshore was valid although not in any way connected by grant with the king, thereby differing from the foreshore of Scotland, to which a subject can only claim right by an express title thereto flowing directly or indirectly from the Crown. This judgment might perhaps lead to a reconsideration of the decision in Bruce against Smith; for Lord Lee, who dissented from the opinion of the court in that case, expressed doubts as to the application of the law of Scotland to the foreshore of Orkney and Shetland, and on this point, at least, his doubts have been confirmed.

By old Norse law, the fact that a man was in possession of lands was in itself sufficient title, and no written proof was required, the oral testimony of witnesses being enough. The same rule prevailed in other countries before they were subjected to the feudal yoke, and in this connection we may quote a passage taken by Professor Menzies from an Italian legal code

of the seventh century: 'If the purchaser of a property could not obtain a judicial instrument of the transfer, he must proceed to the ground with six witnesses if the ground was of moderate size, three if it was small, and if large with twelve, taking along with him also an equal number of boys, and in the presence of these he was to pay the price, and to receive possession, at the same time whipping each of the boys and pulling their ears, in order that, having the transaction thus forcibly impressed upon their minds, their testimony for the future might be secured.' In England a similar ceremony known as 'the Beating of the Bounds' used to be performed on Holy Thursday. Samuel Pepys, in his Diary, tells us how, when a child, he used to take part in the perambulation of the parish boundaries, and remarks 'how heretofore, and yet in several places, they do whip a boy at each place they stop at in their procession.

In our own days the custom of 'riding the marches' is kept up in certain localities, and takes us back to the times when few could write and the only evidence of fact was the human memory. But what Balfour calls 'the feudal distrust of undocumented title' at an early period modified the udal customs, and nowadays the sale and mortgage of lands are usually completed by deeds in feudal form. Until the latter half of the seventeenth century, when the Enclosure Acts were passed, there could still be found 'relics of the primitive community of ownership in land,' for no one could prevent trespass of man or beast on his property except while the crop was in the ground.

There are other instances of the survival of udal law in Orkney and Shetland, such as 'skat,' the ancient territorial tax, which the islanders still pay in addition to their share of the imperial land-tax levied upon the whole of Scotland; and the right of the heir to succeed to land without the necessity of any procedure to establish his relationship, which is required in the case of all feudal estates.

It is both interesting and instructive to trace these last remnants of the ancient customs of a primitive people as they survive amongst us even yet. It shows how strong and full-blooded a thing usage is—for law, after all, is only codified usage—and that what is a mere custom to-day will be recognised as a law by succeeding generations.

THE COLOUR-LINE AGAIN.

THE publication of an article in these pages, by Mr John D. Leckie, late of Villa Rica, Paraguay, on 'The Colour-Line' (1912, page 532), has awakened some controversy, and letters received by the Editor show very clearly that it is an exceedingly dangerous topic for a

non-controversial magazine to touch upon. One of these letters from an anonymous correspondent in New Orleans having been sent to Mr Leckie, he has written as follows about this communication. His reply shows that he possesses a first-hand knowledge of the subject, due to

long residence in America and the West Indies:

'My critic in no way disproves the truth of any of my statements. He says "the Indian is of a totally different type of race [from the negro], and naturally he is treated in another manner." Quite so; but the Chinaman also is of a different type, and much superior to the negro and to the Indian; yet in the Western States he is treated, or was in my time, with the same contempt and injustice that the negro is treated with in the South. I maintain that men like Dr Booker Washington are entitled to be treated with as much courtesy as any Indian; and the fact of a mere drop of black blood in a man's veins should not condemn him to social ostracism if he has the manners and education of a gentleman. Reference is made to the case of Victor Adolphus Nero. I know the case very well, as I was in Glasgow at the time. Nero was a coloured man who was accused of certain misdemeanours whilst in that city. I do not know who was most to blame, Nero himself or others; but when he was in prison on a charge of fraud, it was reported in the papers that ladies sent him their operacloaks when he complained of feeling cold.

'The letter-writer accuses the Scots of ignorance of racial matters. Now, I am a Scotsman. I was born in the island of St Thomas, West Indies, of Scottish parents, and while yet a child was sent to Scotland to be educated. This fact, I believe, is known to the Editor of Chambers's Journal. In St Thomas the coloured population exceeds the white in the proportion of at least ten to one; my nurse was a coloured woman, and among the elder servants of the household were women who had been slaves of the family in their youth. I was brought up among negroes; I have lived among them in Cuba and Porto Rico, where slavery had only recently been abolished; I have lived among them in Brazil, where the negro is treated with justice, which I think is not the case in the Southern States; and, last of all, I have also lived in the Southern States. I was in New Orleans, from whence my anonymous critic writes. A daily paper called the Delta was published in that city; I was stenographer on its staff for some months, and left when the publication was stopped about May 1893. I have also lived in other parts of the South. I was in Tampa, Florida, about June 1885, shortly after the railway had been opened up from Sanford. When I passed through Tampa a lynching outrage had just taken place. A negro was dragged out of his cell and hung in the yard of the courthouse, the court being in session at the time. It was afterwards clearly proved that he was innocent of the offence with which he was charged, and for which he was lynched; but no punishment was inflicted on the perpetrators of the outrage. I could also cite numerous

similar instances known to me. My critic states that "where you find the smallest percentage of white blood in a nigger you get insolence and laziness." To a certain extent this is true of the Southern negro, but it is not an invariable rule; and, in any case, no man should be punished for failings of his race from which he is personally exempt. Each individual should be treated on his own merits.

'In other parts of the world I have found the negro very different in character from his brother of the South. South Africa is also referred to. I should be very sorry indeed if South Africa should follow the example of any other countries which tolerate lynching of negroes; but that is not likely to happen. Where the British flag waves there is justice for all races. Make the laws as rigorous as you please; but treat the negroes according to the law, and do not hand them over to the savage methods of a mob. I have read of one or two cases in which coloured men in South Africa have been accused of making overtures to white women; but so far as I can gather, there is no evidence to prove that this was at all general. My critic's experience seems to be limited to the negroes of the Southern States. I have lived in the West Indies, where negroes are more numerous than in any other Englishspeaking country, but I know of no instance of a coloured man there having made overtures to a white woman. Further, the writer states that the British "do not know what a nigger is." that remark does not apply to me, it may be dismissed without further notice.'

HALT!

LET it not sound just yet, for fair
The country where my march is set.
I love the stinging moorland air,
The scent of gorses dewy wet.
Oh bugle, do not call just yet!

With swinging step and easy pace
I go with comrades blithe and strong;
The wide horizons melt in space,
While sometimes in the ranks a song
Is lilted as we march along.

Once, on a dangerous mountain track,
When night stole furtive o'er the sky,
From out a web of sunset wrack
The Halt! was sounded suddenly,
And something in me seemed to die.

On, many a mile, I fain would go,
Where the short grasses clip my feet,
Or rougher ways where briars grow.
Sunshine or rain, they both are sweet;
At sundown rings out the Retreat!

Halt! When it sounds the march is done,
The time is fixed, the distance set;
And each man hears it one by one,
And some are glad, but some regret.
Let it not be for me—just yet.
C. FARMAR.

THE WRONG KEY.

By Hugh Morris.

CHAPTER I.

'TALKING of ciphers,' said the inspector, as we sat drinking our coffee after dinner on the broad, cool stoep of his house, 'that wagon down the street there reminds me of a rather amusing case of how I was once nearly taken in by a cipher, so simple that a child might have invented it. If I hadn't happened to sprain my thumb in a row a day or two before, I'd never have spotted it, and there would have been the deuce to pay in this district.'

He broke off to watch a heavily loaded woolwagon, drawn by a fine team of sixteen oxen, creaking slowly down the dusty street in charge of a grinning Hottentot voorlooper, whose earsplitting squeals, though they would have put a motor-horn to shame, failed to move the sleepy oxen out of their lumbering walk. It was intolerably hot out there in the sun, and I felt sorry for the patient beasts.

'That wagon of Van Zyl's looks innocent enough, doesn't it?' the inspector went on. 'But it's had its riotous youth—a regular night-prowler it used to be once, a real bad lot! Used to carry o' nights more than wool in those bales; nearly set the whole district off in a blaze of civil war!

'It was in the early part of the war, when we were all wondering whether the Boers from over the border would invade the Colony, and whether the Cape Dutch would rise and join in with them if they did, that I was sent here to Keurstad, to be a sort of all-round assistant to the Resident Magistrate in the administration of martial law. It was a rather anxious time, as you may remember, since we hadn't enough troops to spare just then for the patrolling of the disaffected districts, and most of the work had to be left to the civil authorities. Keurstad it was a long time before we had even a military commandant, and the magistrate had to take his place, with me and my four policemen as an "intelligence department." We had a town guard of sorts, of course; but seeing that most of the men were Dutch, who had joined for the five bob a day, we might have been better off without them.

'Part of my work was the censoring of the mails, a thing that had to be done all over the Colony under martial law. It wasn't a very nice

job, but in the long-run it saved a lot of trouble. It's better to prevent people from making fools of themselves than to punish them for it afterwards; and there were a lot of hot-headed Dutch Colonists who wanted to make trouble. We used to find signs of it in their letters, and quietly deport them before any harm was done. We were living on the top of a volcano just then, and there was no room for fools!

'One afternoon I went into the chief's office, and found him looking worried.

"Look at this, Stewart," he said, handing me an official telegram.

'It was a code message from one of the farm post-offices on the outskirts of the district, and underneath it, in pencil, was the chief's translation: "Rifles and ammunition in large quantities found at Klein Spruit. Stop further importation at all costs."

'I whistled. It was a serious matter, for we were trusting entirely to the unarmed state of the district to prevent a rising just at present. All firearms of any kind had been called in at the outbreak of the war, and as a list of them had always been kept, we were fairly certain that we'd collared nearly the lot. A sharp watch had been kept on all wagons coming into the town by way of the pass through the mountains, and they had all been searched either by myself or by one of my four policemen; for we knew that if the farmers once began to get hold of rifles again, they wouldn't be disarmed this time without bloodshed, and in all probability a general rising.

"Now, look here, Stewart," says the chief

"Now, look here, Stewart," says the chief very gravely; "this won't do. If you and your men can't manage to put a stop to this gun-running, we'll be in an infernally tight place before long. It must have been going on for weeks, and the only way those rifles could have got in must have been by the mountain road from the south, the one that leads through the town. All the others are patrolled by the regular Mounted Police, and the Dutch wouldn't try to pass them."

"That's rather rough on my men, sir," I said; "but the fact is—though it's a nasty thing to say—I don't think much of them. Three out of the four have got relations fighting on the other side, and can't be expected to be over loyal; and the other one is a pretty soft mark at the best."

No. 177.—Vol. IV.

[All Rights Reserved.]

APRIL 18, 1914.

"Yes," he said, shaking his head, "it's a rotten lot, and no mistake; but you've just got to make the best of it, and stop these rifles coming in. We can't afford to let it go on a day longer, for with every rifle that gets into the district there's more chance of a row. And you know how we'd stand an attack on the town just now. So just you get a move on, and catch that blessed gun-runner."

"Very well, sir," I said. "I'll do my best."
"D—— it, man!" he shouted, banging his fist on the table, "I didn't tell you to do your

best; I told you to catch him!"

'I saluted and cleared out. This was pretty hard talking from the chief, who wasn't a panicky sort of chap at any time, and I saw that things must be getting pretty serious. The news from Natal and Stormberg had been bad, and the disloyal party were beginning to get their tails up, so that we couldn't afford to take any chances just then. For a long time, though, I couldn't see any way of putting a stop to the smuggling game, as I hadn't the remotest idea of who was running it. But in the evening, when the bugle of the post-cart sounded down the street, I saw my way to begin the work, at any rate.

'I told young Bartman, the magistrate's clerk, to bring me the mail-bags as soon as they were received by the post-office, so that I could go over them before they were delivered. Bartman was a keen young chap; rather a weed, I thought, but a hard worker, with an eye to promotion; with his spectacles and his streak of a moustache he looked a regular sucking assistant magistrate

—more of an official than a man.

'He came back from the post-office about halfan-hour later with the bags, and as he laid them down on the table he asked casually whether I wanted any assistance.

"No," I said shortly, "I don't! This is a confidential job, so just get out and leave me to

get on with it!"

"All right, Mr Stewart," says he, turning a bit red; "but I suppose I may have my own mail before I go? I'm expecting one from a store in Vrijstad that has to be answered to-night. Besides, you won't want to read any of them, will you?" I knew that he had a girl in Vrijstad who used to send him letters as thick as an official report almost every day, so I tried to pull his leg.

"No, you can't," I told him; "though you needn't think I want to read all your turtle-dove cooings, you young ass! But, for all I know, your correspondent in Vrijstad may be in Cronje's confidence, so I'm going to search the letter for

seditious matter."

'I was surprised to see him turn quite white at my silly joke; though he recovered himself in a moment.

"It's not from her, confound it!" he said, with a blush this time; "it's from a firm of typewriter agents in Vrijstad about a new set of

type that I want to order for the office machine. I want to send off the order to-night, so as to get the new set by Friday."

"Blow your typewriter!" I said. "You'll just have to wait like the rest. Get out!"

'I opened the mail-bags and set to work, hoping to find some sort of hint as to who were the people who were playing this game of blindman's buff with me; but after an hour or more of searching I saw that it was no good. If the writers of any of those letters knew anything about the business, they were too cute to make any reference to it in their private correspondence. There was nothing beyond the usual sort of thing that one would expect to find in a country mail-bag: farm news, reports of how the boys were doing at the college at Stellenbosch, and all that—very interesting, I suppose, but of no earthly use to me. There was a letter addressed to Bartman among them, in an envelope with the name of a Vrijstad firm printed on it; and, as a matter of form, I opened it. It was, as I expected, nothing more than a business letter. Here it is:

"Dear Sir, —With reference to your esteemed communication of the 12th inst., we beg to submit for your approval a specimen imprint from the numeral type you mention, pattern No. 15:

"717%14(8'7181")9(8'081(\$7187" 01\$184£8))'318828("8'7'"181

Trusting that it will fulfil the conditions for which you require it, we are, yours obediently,

"P. J. Bosman & Co., Typewriter Agents, Vrijstad."

'There was nothing of any interest in this; it was just an ordinary business letter; but for some reason or other—it must have been that the look on Bartman's face when he asked for his mail came into my mind—I hesitated for a moment before putting it back into its envelope.

'Then I noticed that the clerk who had typed the letter had been careless in the way he'd arranged the sample print. He had repeated the same figure in several places, and the whole letter was rather slovenly in the typing. he may have just run over the keyboard of the machine anyhow, and so long as he showed a sample of the size and shape of the type, it would be good enough for the purpose. Yet Bartman had seemed very anxious about that letter. I wanted to have another look at it. I'm a bit of a dab at ciphers. I always made a hobby of trying to read them in the magazine stories, in the same way as some men waste their time over chess problems; and I can generally puzzle out the meaning of the ordinary run of them. But if this was a cipher, I thought, after I'd had a good look at it, it wasn't like any that I'd come across

'All the same, just to satisfy myself, I made a careful copy of the whole letter, figures and all, and then sealed it up with the usual gummed slip marked "Passed Press Censor" that we had to use, and called for Bartman.

"Get me some sealing-wax and a candle," I ordered, "and then you can take these bags across to the post-office."

"Very well, sir," he said. "Any letters for me ?"

"Yes, there's one for you," I told him, giving him the letter; "the one about the new type you were expecting. I opened it; but it's not in Kruger's handwriting after all, so we'll let you off this time."

'He took it easily enough, but I was watching him, and I noticed his hand shake, and as he opened it he glanced sideways at me, as if to see what I thought of his precious letter. He read it through, and then passed it over to me.

"" Seems a decent enough sort of type," he said, "better than what we've got on the office machine at present. I think I'd better order a set. If you're not in a hurry, Mr Stewart, I'll just go and type off the order at once, so as to save another journey to the post-office."

"I don't know anything about it; never used a typewriter in my life. But I may want to do so to-night, though, as I've managed to sprain my thumb pretty badly, and I can't hold a pen properly. Doesn't take long to get the hang of the machine, does it?'

"Oh, I don't know," he said, with the same anxious look on his face. "I shouldn't advise you to try if you're in a hurry; it'll take you a long time to pick it up."

"Then I won't," I said, "as I haven't much time to spare; the letters have to go to the office to-night, and it's nearly nine o'clock aiready.

'He went into the inner office, where I heard him tapping away on the machine, rather slowly, it seemed to me; and then he came back to take away the sealed bags. When he'd gone I unfolded my copy of the letter, and settled down to find out whether it had any meaning other than the obvious one. I tried all the little dodges that I knew for solving ciphers; picking out the signs in the order of their frequency, and calling the first e, and the commonest pair th, and all that sort of thing, at first; and later on, when that didn't help, the more scientific methods. But it was no good; I couldn't get the least glimmer of a meaning out of it. Try it yourself and see whether you can make anything of it. After about an hour I saw that I'd been making a simple fool of myself; the message was just what it pretended to be, a plain business letter. I wondered what the chief would have said if he'd known that I'd been hunting for mares' nests in this way; and I could have kicked

'I got out the official letters that I had to answer, and started work on them, so as to be able to leave the office early; but after a little

while I found my sprained thumb so painful and awkward that I gave it up as a bad job. Then it occurred to me to have a shot at using the typewriter to finish the job; so I went into the inner office and began to examine the thing. After spoiling a few sheets of paper with experiments, I began to pick up the idea of it. Each key could print three signs, according to whether you pressed down one or other of the two keys in the centre of the keyboard marked "Cap." and "Fig.," and each had a letter and a number marked on it. It was quite simple; if you wanted a capital you just had to press the "Cap." key, and hold it down while you typed the letter you wanted. It was the same for figures with the other key.

'But where I got stuck was in holding the key down with my sore thumb while I worked the other keys; it was very awkward. So I hunted round until I found a catch that was meant to keep it down when one was writing in capitals only, and jammed it down with that each time I began a sentence. Presently I forgot to lift it up, and went on typing away without looking at the paper, until, on shifting the line, I saw that instead of "It has been," I had on the paper, "9"7 ($\frac{1}{8}88\frac{1}{4}$."

'I was just going to throw the sheet away and start afresh, when I saw what had happened. I'd forgotten to release the key, and had carelessly used the wrong key, the one marked "Fig." instead of the one marked "Cap.;" they were together on the keyboard, so it was a natural

mistake for a beginner to make.

'Then I saw what any one who'd ever used a typewriter would have spotted at once. Bartman's letter had been typed with the figure-key held down, but otherwise just as one would write an ordinary sentence. The thing was as simple a cipher as you could wish to see; a child could have invented it.

'But, then, how was it that I'd been so puzzled by it? Surely I could solve a cipher of that kind, the most elementary kind that there is. looked at it again, and shook my head; it still stuck me. So I copied it out, sign by sign, on the typewriter, picking out the keys that had the right signs on them. The first one, ", was on the same key as V; the next, 7, on the same key as A; 1 was on the N key; and so on. When the whole row of figures had been typed out in this way I had:

VANXZYLSQWAGENHUISQWOENSDAGQAV ${\bf ONDXELFQUURXNEEMQSTEWARTXWEG}$

'I stared at this, and scratched my head again; it didn't seem to be much use after all, until I saw, near the end of the message, the letters of my own name—you know how they will always catch your eye anywhere. Then I remembered that the letters X and Q are never used in Dutch-that is, in pure Dutch; and the whole thing was plain. I wrote it all out again,

leaving a space wherever there was an X or a Q. This gave me (when it was touched up a bit): "Van Zyls wagenhuis. Woensdag avond, elf uur. Neem Stewart weg." Translated

into English, this meant: "Van Zyl's wagonshed. Wednesday evening, eleven o'clock. Take Stewart away."

(Continued on page 328.)

THE RETURN OF THE BIRDS.

By G. GRAHAM MURRAY.

To the bird-lover the spring months are fraught with particular interest, for then is the season when the 'birds come north again,' and long before midsummer is reached the migrants have established themselves in our hedgerows and woods.

Among these welcome visitors we find some of the most famous songsters, such as the nightingale and blackcap; though in Scotland we are not favoured with a visit from the former. Some of the voyagers do not tarry with us, being bound for more northern quarters; others, again, come to stay.

Should spring-like conditions occur during the end of February, the southern coasts of England and Ireland receive the first birds to return from their Continental winter retreats. These birds are partial migrants, and among them are found song-thrushes, mistle-thrushes, starlings, skylarks, and rooks.

In contrast with the arrival of the summer birds is the departure of our winter guests to their summer quarters.

March, as the proverb tells us, is a variable month, expiring winter and advancing spring meeting together; but to the naturalist and the farmer it is a most important season.

Among the returning local birds we find the pied and gray wagtails, each the epitome of grace and neatness; whilst mallard, teal, and woodcook are seen moving northward. But perhaps it is the arrival of the real summer visitors which thrills us most. About ten different birds arrive regularly between the middle and the end of March. These birds are the ring-ouzel, the wheatear, the chiff-chaff, the willow-warbler, the swallow, the sand-martin, the wryneck, the garganey, and the Sandwich tern.

Various other birds are of course recorded, but they cannot be counted as regular March arrivals. Again, in Scotland the dates of arrival are rather later than in England, usually about a fortnight; whilst in Ireland the swallow is seldom seen before the beginning of April. It is interesting to note the approximate date of arrival of some of these spring birds, though of course these dates vary from year to year. The chiff-chaff is usually the first little traveller to arrive in England, about the 16th of March, reaching Scotland about a fortnight later. This little bird belongs to the group of warblers, and is to be found during the season of primroses and wild hyacinths in the woods and gardens. Its song is scarcely melodious, but it has a particular charm

which is perhaps associated with the thought of returning summer. 'For, lo! the winter is over and passed away.'

The blackcap and the willow-warbler are usually noted as arriving respectively on the 22nd and 23rd of March. These are both garden birds of singular charm. The blackcap's vocal powers allow it to compete with the nightingale; and, though its song is inferior in power and compass, it equals that of the nightingale in sweetness. Gilbert White of Selborne described the song of the blackcap as 'full, sweet, deep, loud, and wild.' This charming bird is usually found in gardens and shrubberies, and will return again and again to its old haunts. At the beginning of the season the blackcap is often to be heard practising its song.

The willow-warbler is a great garden favourite, and it is hard to imagine a more attractive little bird, with its joyous, laughing notes. It may be seen flitting from bush to bush, pausing to hover in the air over its insect prey with the quivering motion of a miniature kestrel.

The swallow's usual date of arrival is 21st March, the sand-martin being recorded two days earlier, and the house-martin a fortnight later. The swallow has always been regarded as the herald of summer, and town and country residents are alike favoured with its presence. The sand-martins, who build in colonies in sandbanks, are equally attractive to watch; and who does not hail with pleasure the sight of the house-martin with its snow-white 'patch,' which shows so clearly as the bird flies to and fro and up and down?

The garden-warbler waits till 15th April ere it reaches the English shores; whilst the woodwren usually precedes it by three days.

The nightingale, which is due on 8th April, the cock-birds arriving before the hens, sings by day as well as by night, and continues its song till the first or second week in June. The nest is constructed of dead leaves loosely put together, and generally placed under a bush. The distribution of the nightingale has always been a problem in ornithological geography. For instance, why should this bird keep aloof from the counties of Devon and Cornwall, counties which seem so ideally suitable for these birds if they would only come? And yet the nightingale has fixed boundaries which it will not overstep.

Summer is icumen in, Loud sing cuckoo! and by the first week in April this bird is to be found in England. The wryneck usually precedes it by ten days; whilst the nightjar is due about 18th April.

The swift is not one of the early arrivals; the end of April sees it in England, and the beginning of May in Scotland. Perhaps the first sight of the swift as it dashes through the air is one of the pleasantest records in the bird-lover's diary, for the swift seems to embody such perfect grace with perpetual motion.

The common tern is also a latish arrival, about the middle of April; whilst the dotterel's record

is 20th April.

Besides the mighty stream of arriving migrants, there is also the emigration of our winter birds. Moving northward are to be seen great numbers of song-thrushes, blackbirds, redbreasts, gold-crests, chaffinches, buntings, redpolls, starlings, rooks, skylarks, geese, wild-duck, woodcock, and various other birds. Surely birds are famous travellers, and the whole study of migration a most fascinating one. Mr Eagle Clarke, who is probably the greatest living authority on the

subject, has given in his most fascinating book, Studies in Migration (Edinburgh: Oliver and Boyd), all the records of the year, as well as the theories which account for these wonderful seasonal voyages. He tells how, when watching at the Eddystone Lighthouse on 11th to 12th April 1892, he witnessed a mighty stream of migration which took place between the hours of 8.45 P.M. and 11 P.M.: 'At midnight hundreds of ring-ouzels and redwings came upon the scene, accompanied by starlings and swallows, and a perfect cloud of small birds composed of redstarts, nightingales, blackcaps, tree-pipits, and many other species.'

The beginning of June witnesses the close of the spring migration, and the months that follow are full of nursery joys and cares. Soon, too soon, the hours of summer fly; but one of the joys of bird-watching is that each season has its

especial attraction.

Sing a song of seasons, Something good in all; Flowers in the summer, Fires in the fall.

A KNIGHT ON WHEELS.

CHAPTER XIX.-MY SON TIMOTHY.

PHILIP and Miss Jennings resumed business faces next morning; and although they subsequently indulged in other jaunts, one of which—a Saturday-afternoon excursion to Earl's Court—included Sister May, no cloud of sentimentality ever arose between them to obscure the simple clarity of their relations. Jennings was much too matter-of-fact a young person to cherish any romantic yearnings after her employer. She was not of the breed which battens upon that inexpensive brand of literature which converts kitchenmaids into duchesses. She recognised Philip for what he was-a very kind, rather shy, and entirely trustworthy gentleman—and accepted such attentions as he offered her with freedom and confidence. Nor did Miss Jennings herself make any direct impression upon Philip's peace of mind beyond arousing in him a dim realisation of the fact that the elixir of life is not exclusively composed of petrol. At present his heart was too full of applied mechanics to have room for tenderer preoccupations—a very fortunate condition for a heart to be in when it belongs to a young man who has yet to establish a position for himself.

So life in the London offices went on for two years. It contained a great deal of hard work, and a great deal of responsibility, and a great deal of drudgery; but it had its compensations. Philip still played Rugby football in the winter, and suffered upon a sliding-seat for the honour of the Thames Rowing Club in the summer. There were visits to Chelten-

ham to see Uncle Joseph, and to Red Gables to see the Mablethorpes. There was the everenthralling pageant of London itself. And there was the rapturous day upon which a high official of the company arrived upon a visitation, and announced, after compliments, that the merits of the Meldrum Automatic Lubricator (recently patented) had so favourably impressed the directors that they had decided to adopt the same as the standard pattern upon all the company's cars. Would Mr Meldrum enter into a further agreement with the directors to give them the first refusal of any further inventions of his? Those were days!

Then, finally, with a hilarious splash, came Timothy. He arrived one morning to take possession of a six-cylinder Britannic touring-car which had just been completed to his order-or rather to the order of an indulgent parent. He was a hare-brained but entirely charming youth of twenty-two, and Philip, who encountered far too few of his own caste in those days, hailed him as a godsend. Each happened to be wearing an Old Studleian tie, so common ground was established at once. Philip inquired after Mr Brett, and learned that that 'septic blighter' (Timothy's description) had retired from the position of Housemaster, and had been relegated to a post of comparative harmlessness; but the old House was going strong.

All this time they were examining the new car. It soon became apparent that the technical knowledge of Mr Rendle (Timothy) was not of a

far-reaching nature; but his anxiety to improve it was so genuine that Philip sent to the workshop for a mechanic to come and uncover the cylinders. Presently that fire-eating revolutionary, Mr Brand, appeared.

'If you are not in a hurry,' said Philip, 'we will take the top off the cylinders, and then I

can give you a demonstration.'

No, Mr Rendle was in no hurry. He was a young man of leisure, it appeared. 'Only too glad to spend such a profitable morning,' he said.

'Usually in bed at this time of day.'

Mr Brand, whose views upon the subject of the idle rich were of a decided nature, looked up from a contest with a refractory nut, and regarded Timothy severely. Then, returning to his task, and having laid bare the internal secrets of the engine, he plunged into an elaborate lecture, in his most oppressive and industrious-apprentice manner, upon big-ends Philip did not interrupt. and timing-gears. Mr Brand was fond of the sound of his own voice, and was obviously enjoying his present unique opportunity of laying down the law to a wealthy and ignorant member of the despised upper classes. He employed all the long words he could think of.

Timothy positively gaped with admiration. 'I say,' he said, 'you ought to go into Parliament.'

'P'r'aps I shall,' replied the industrious apprentice haughtily. Evidently with the intention of resuming his interrupted discourse, he cleared his throat and took a deep breath. Then, suddenly, his mouth closed with a jerk, he turned a dusky red, and assumed an ostrichlike posture over the cylinders of the car.

'There's a trunk call-coming through for you,

Mr Meldrum,' said a clear voice.

Philip turned round, to find Miss Jennings. 'I shall be back directly, Mr Rendle,' he said to Timothy, and accompanied the typist to the office.

'Brand a friend of yours, Miss Jennings?' he inquired jocularly, as he sat down to the

telephone.

Miss Jennings sniffed. 'That hot-air artist?' she replied witheringly. 'I don't think. He's the laughing-stock of the place. Besides, we on the office staff keep ourselves to ourselves. We don't'——

At this moment the trunk-call came through, and the conversation terminated.

When Philip returned to the showroom, Mr Brand had completed his task and departed to his own place.

'Our chatty friend,' announced Timothy, 'has put me up to most of the tips. I shall be a prize chauffeur in no time.' He surveyed the gleaming car admiringly. 'She's a beauty. What should I be able to knock out of her? Sixty?'

'Quite that.'

'Wow-wow/' observed Mr Rendle contentedly.
'I don't mind laying a thousand to thirty that I get my license endorsed inside three weeks.'

Philip, who regarded new machinery much as a young mother regards a new baby, turned appealingly to the cheerful young savage beside him. 'Don't let her all out at once,' he said. 'Give the bearings a chance for a hundred miles or two. And—I wouldn't go road-hogging if I were you.'

Timothy turned to him in simple wonder. 'But what on earth is the use of my getting a forty horse-power car,' he inquired almost

pathetically, 'if I can't let her rip?'

'There are too many towns and villages round London to give you much of a chance,' said Philip tactfully. 'I'll tell you what. Take the car to Brooklands, and see what she can do in the level hour.'

The face of the car's owner—whose conscience upon the subject of road-racing was evidently at war with his instincts—brightened wonderfully. 'That is some notion,' he cried. 'You're right. Road-hogging is rotten bad form. We'll run this little lad down to Brooklands—oh so gently!—and then go round the track all out. Will you come with me?'

'Rather!' replied the primeval Philip with

great heartiness.

'And come and dine at the club afterwards,' added Timothy in a final burst of friendliness.

Within the exaggerated saucer constructed for the purpose at Brooklands they succeeded in covering seventy-three miles in sixty minutes, Timothy deliriously clinging to the wheel, and Philip sitting watchfully beside him to see that centrifugal force did not send the new car flying over the rim into the conveniently adjacent cemetery of Brookwood.

Thereafter they dined together at a newly opened club in Pall Mall, which seemed to Philip to contain several thousand members. Members swarmed in the great central hall, upon the staircase, and in all the lofty apartments opening therefrom. There appeared to be at least six hall-porters, and there were page-boys innumerable, who drifted about in all directions wearing worried expressions and chanting a mysterious dirge which sounded like 'Mr Hah-Hah, please!' There was a real post-office in one corner, and a theatre-ticket office in another. There were racquet-courts, and a swimming-bath, and a shooting-gallery, and a gymnasium, and a bowlingalley, and a fencing-school. Timothy confidently announced that there was a golf-links somewhere, but that he had not yet found time to play a round owing to the excessive length of the holes.

Eschewing what Philip's host described as the 'cock-and-hen' dining-room (where the two sexes could be seen convivially intermingled, partaking of nourishment to the sound of music), they ascended in a lift to the first floor, where they

sat down in a vast refectory of a more monastic type. Here one gentleman greeted them at the door; while a second took Timothy's order for dinner, and passed it on to a third. The dishes were served by a fourth, and cleared away by a fifth. The same ceremony was observed in the ordering of wine.

Less fuss up here than downstairs, explained

Timothy.

Philip enjoyed his meal immensely, though he wondered, characteristically, if all these ministers to his comfort—especially the pageboys-had partaken, or would partake, of an adequate meal themselves. Timothy, who contracted friendships almost as impulsively as he purchased motors, chattered to him with all the splendid buoyancy and frankness of youth. His vocation in life, it appeared, was that of Assistant Private Secretary to a prominent member of His Majesty's Opposition. The post was unpaid, and the duties apparently nominal. But Timothy was quite a mine of totally unreliable information upon the secret political history of the day. He told Philip some surprising stories of the private lives of Cabinet Ministers, and foretold the date of the next general election with great assurance and exactitude.

Later in the evening, as they drank coffee and liqueurs in an apartment which reminded Philip of Victoria Station (as recently rebuilt), Mr Rendle conducted his guest through a résumé of several love affairs-highly innocuous intrigues, most of them—and added the information that 'that sort of thing' was now 'cut out' owing to the gracious and elevating influence of a being only recently encountered, whom he described as 'the best little girl that ever stepped.' 'I don't know her very well yet,' he concluded, in a burst of candour. 'In fact, I don't even know what her name is. I met her at a dance. All I could find on my programme next morning was "blue bandage"round her head, you know. But I will find her again.

'I am sure you will,' said Philip, who had yet to learn that these final reformations of

Timothy's were of a recurrent character.

'Thanks, old friend, for your kind words,' replied the love-lorn youth. 'Tell me, how much does a man require to marry on?'

'Thirty-five shillings a week,' said Philip. 'At least, so some of my colleagues tell me.'

'I have two thousand a year,' said Timothy doubtfully. 'I don't know how much that is a week, but I'll work it out some day in shillings and see. Anyhow, when I meet her, I shall take her out in the new car. Are you married?'

'No,' said Philip.

'That's a pity. Your wife might have chaperoned us. But if you get married, let me know.' He looked at his watch. 'Ten o'clock.' he announced. 'Now, what shall we do next? The premises here are at your entire disposal. Would you like to have a dry shampoo, or fight a duel, or buy a postal order, or what? Or shall we go to a theatre?'

Philip mildly pointed out that most of the

theatres opened at eight.

'Then we will go to the Empire,' said the resourceful Timothy.—'Waiter, is there a Tube Station in the club? I always forget.'

'No, sir,' said the waiter compassionately.

'But there is a cold plunge,' he suggested.
'No good, I'm afraid; but thanks all the same,' said the polite Timothy. 'Get a taxi.'

WANE OF PARLIAMENTARY CUSTOMS. THE

By MICHAEL MACDONAGH.

PARLIAMENT changes constantly in its habits and customs. Processes of modification and obliteration are ever at work, in obedience, it may be, to influences which are beyond human control. Usages of etiquette drop away little by little, and bit by bit, unperceived—so slow and gradual is the course of innovation over a long period of years—until they disappear altogether, and are finally forgotten. Why this is so is easy of explanation. The rules which govern order and etiquette in the House of Commons are both written and unwritten. The written laws-or 'Standing Orders,' as they are officially termed—are fixed, and can be altered or abrogated only by special resolution. But the practices of etiquette, being mainly unwritten, and therefore embodied in no substantive record, are liable to fall unnoticed into abeyance.

So imperceptible almost is this slow waning

of ancient usages in the House of Commons that, in particular cases, the period they were last observed cannot be exactly fixed. For example, it was the general custom during most of the eighteenth century for all members to wear Court dress, lace ruffles, and swords. In time only Ministers appeared in the House in this costume, with the stars and ribbons and other insignia to which they were entitled. The general use of Court dress in the House of Commons died out early in the last quarter of the eighteenth century, but it was sometimes worn by Ministers on great occasions or at 'full-dress debates'the origin of the phrase is obvious—in the first decades of the nineteenth century. most diligent search in official records and in biographies and diaries of parliamentarians of the late eighteenth and early nineteenth centuries has failed to fix the exact time when this revolution in the dress of the representatives of the nation was completed, and a most picturesque feature of parliamentary life entirely disappeared.

The substitution of a more sombre dress for the elaborately gay and picturesque dandyism which prevailed throughout most of the eighteenth century set in during the French Revolution. The eighth Duke of Argyll relates in his Autobiography that his father used to say that Charles Grey of Northumberland-afterwards the Earl Grey of the Reform Act—was the only member of the House of Commons who ostentatiously wore coloured clothes when all the others wore mourning on the execution of King Louis the Eighteenth being announced from Paris. In this country dress lost much of its richness of ornament, both in sorrow for the victims of the French Revolution and in sympathy with its levelling principles. Still, as I have said, the leading Ministers carried the custom of wearing knee-breeches, lace cravat, ruffle, and orders into the nineteenth century. What a shout of welcome used to go up from the Tories when Castlereagh, rising from the Treasury bench, was seen readjusting his blue ribbon of the Garter on his breast as a preliminary to a speech! And does not Disraeli, in Endymion, make Sir Fraunceys Scrope, the Father of the House, say to the young hero of the novel, 'I remember so late as Mr Canning the Minister always came down in silk stockings and pantaloons or knee-breeches'?

Probably the picturesqueness of attire came to an end when the Reform Act was passed. The last time the red ribbon of the Bath was seen in the House was when it was worn by Manners Sutton, the Speaker of the last unreformed and the first reformed Parliaments. I have seen an engraving of the scene in the House of Lords when the Reform Bill received the Royal Assent. The members of the House of Commons standing at the Bar were dressed either in cut-away coats, breeches, and top-bootsthe traditional attire of John Bull-or in long coats and trousers. At that time county members, as distinguished from borough members, had the privilege of appearing in the House in breeches and top-boots. It was the last survival of distinctions of dress prevailing among the representatives of the people in Parliament. Another significant feature of the scene in the House of Lords on that memorable occasion was the deserted condition of the Opposition benches. The Tory Lords, as we know, sullenly yielded to the threat that if they did not allow the Bill to pass new peers would be created in sufficient numbers to carry it into law; and they kept away from the House at the last phase of all. On the day that the Bill received the Royal Assent, Lord Bathurst -who used to have his hair powdered and wore a queue in the old style—cut off his pigtail, exclaiming, 'Ichabod! for the glory is departed.'

Changes in the etiquette of dress are greatly accelerated when a Parliament mainly composed

of new members, unfamiliar with the traditions of St Stephen's, is elected, as in 1906. In the very first session of that Parliament several noteworthy innovations in constitutional usage and long-established custom unwittingly took place. For instance, the beginning of the end of the old practice of members wearing their hats in the Chamber can be rightly ascribed to the session of 1906 by the future historian of departures from the traditions and customs of the House of Commons. In nineteenth-century as well as eighteenth-century prints of the House only the Ministers on the Treasury bench are seen uncovered. There was a rule, unwritten but strictly observed, that private members must wear their hats in the House. This is a very ancient custom. Its origin has been ascribed to draughts in the House. More probably it is a heritage from the primitive open-air moots in which the wise men of the nation first assembled. By virtue of another old custom-the origin or purpose of which, like many others, is a mystery—the Chancellor of the Exchequer and the Secretary to the Treasury (the Ministers responsible for the taxes and their collection) were, alone among the members of the Government, supposed to wear their hats when seated on the Treasury bench. But it was not considered 'correct' for any one save a Minister or a Whip to appear in the Chamber or in the lobbies bareheaded. That convention came to an end in 1906. Members now wear their hats or go without them whenever and wherever they please.

As late as the middle of the nineteenth century a member was also expected to wear the morning attire ordained by fashion. On the Speaker the duty fell of reprimanding breaches of the con-Of course, if a member ventions as regards dress. of Parliament chose to ignore or defy these unwritten laws, there was no power in the House to call him to account and administer punishment. Instead of wearing the regulation tall hat and frock-coat, he might appear in a lounge-suit and a bowler or wideawake hat, and the doorkeepers dare not refuse him admission to the House. But he would have to reckon with the authority of the Chair, as well as with the resentment of his bad form on the part of his fellow-members. As a rule, a private request from the Speaker was sufficient to induce the member to return to conventionality in attire. Once, however, a member answered the message of Mr Speaker Shaw Lefevre with the defiant reply that he should wear what he pleased. 'Very well,' said the Speaker; 'no matter how often you may rise to address the House, I shall never call you.' Time after time the member tried to catch the Speaker's eye, but always failed, and at last his constituents began to complain of his silence, and say he was a useless representative. Then he was driven to the sensible conclusion that it was ridiculous being condemned to obscurity for the sake of a tweed suit.

Mr Speaker Denison was also a great stickler for etiquette in dress. In 1871 an extreme Irish politician entered the House of Commons in the person of John Martin. He had been concerned in the Young Ireland revolutionary movement, and in 1848 was sentenced to ten years' transportation for treason felony. On taking his seat as member for Meath in 1871 he was observed to enter immediately into conversation with Mr Speaker Denison at the Chair. It was thought he was consulting the Speaker as to the quarter of the House in which it would be proper for him to sit, as he belonged to neither of the British political parties, and the Nationalist Party was still a thing of the future. The interview, however, was for a far different purpose. Martin was also a rebel against enforced compliance with conventions as to dress, and his desire to wear a soft slouched hat—then known as a Republican hat, being a hat without a crown—to which he had become accustomed in his exile, instead of the tall silk hat then habitually worn in the House, brought him up against the Speaker, who was entirely out of sympathy with such revolutionary and ridiculous ideas. After some consideration a compromise was arrived at. As Martin could not be induced to wear a silk hat, the Speaker permitted him to appear in the Chamber 'uncovered.' He was to leave his soft hat in the cloakroom.

This punctilious observance of the etiquette of dress in the House of Commons began to wane in the early eighties of the nineteenth Comfort was thought to be of more account than conventionality, and accordingly members might appear in any dress they liked, in broadcloth or 'in hodden gray and a' that,' as Burns would say; in silk hat, or bowler, or Caroline. Indeed, in the year 1892 Mr Keir Hardie first presented himself to the House of Commons—so far as headwear is concerned—in a tweed cap. He explained that in his opinion members of Parliament should go to Westminster just as they went elsewhere, and should try, as far as possible, to be like those who sent them there. But the rule that members should be covered while sitting in the House or walking about its precincts was not generally departed from until the election of the Liberal Parliament of 1906-10. During its first session the vast majority of members never brought their hats into the House, leaving them with overcoats and umbrellas in the cloakroom. This remarkable departure from a very ancient usage of the House of Commons was due, no doubt, entirely to want of knowledge on the part of the enormous crowd of new members. They could not be expected to know of the existence of a rule which is not embodied in a Standing Order. In fact, most of the new members considered it would be a breach of decorum, or at least an unwarranted act of impudence on the part of those recently elected, to bring their hats into the House. Indeed, they thought it was a mark of distinction, restricted to old and honoured members, to be allowed to wear one's hat in the awful presence of Mr Speaker—a misapprehension which will appear natural enough when it is remembered that by common usage outside Parliament to sit or stand uncovered is an exhibition of respect and deference. Thus another old parliamentary custom disappeared.

The Lords are more punctilious than the Commons in the observance of the conventions in the matter of dress. In the memory of the oldest visitor to the Lobby of the House of Lords -which the peers use as a cloakroom-nothing had ever been seen on the hat-pegs but tall hats until Thursday, 8th August 1907—destined, perhaps, to be a date historic in parliamentary annals—when a straw sailor hat might have been observed under the label, 'Earl of Mayo.' It is true that the noble lord did not wear the straw hat in the Gilded Chamber. But at the sitting of the Lords the same day I noticed other remarkable departures in dress. On the front Opposition bench sat Lord St Aldwyn in a light tweed suit; and on the Government side, just above the Ministers, the buff waistcoat of Lord Courtney of Penwith (with its historic reminiscence of Charles James Fox) flashed out from a group of black frock-coats. Still, not even the Parliament Act, so far as I could observe, caused any great number of the peers, in protest against the measure, to leave off wearing those British fetishes of respectability—the silk hat and frock-coat.

TWO NINETEENTH-CENTURY TYPES.

By T. H. S. ESCOTT.

THE eventful twelvemonth of the new Georgian epoch that included the royal progress through the length and breadth of our Indian Empire was marked by the disappearance of two men who resembled each other as noticeable types of the Victorian and Edwardian age in which they chiefly flourished. Both, also, had lived not only to see themselves household words with their contemporaries on every social level,

but to win their way, as the expounders of Greek myths put it, to the fabulous. About no two men in the kingdom have there ever simultaneously circulated more anecdotes, historic or apocryphal, than about Henry Labouchere and Sir George Lewis. Each also supplied at least one novelist with hints for a character or an episode. George Eliot's Grandcourt in Daniel Deronda owed something, as the authoress

herself admitted, to Labouchere, with whom newspaper readers began to be familiar as 'the besieged resident of the *Daily News*' (1871), and who afterwards increased his notoriety by combining the parliamentary duty of member for Northampton with that of a society journal editor.

During the seventies Lord Beaconsfield had not become the tolerably regular playgoer that he was in his latest years. An adaptation, however, of Bulwer Lytton's Last Days of Pompeii brought him, in or about 1874, to the Globe Theatre, Long Acre. The theatre had then been rented by Labouchere for the lady he subsequently married, Miss Henrietta Hodson, at the time impersonating Nydia in the play. Labouchere, who himself chanced to be present, had met George Eliot and Mr G. H. Lewes, and begged them to enter a box as his guests. Thither accordingly they went, their host politely leading the way. On their reaching the compartment, by some unexplained mistake a gentleman was found sitting silent and half-hidden in one of the corners. The George Eliot party were on the point of backing out, but their hospitable friend so managed as to make that impossible. For the first and only time in their lives, therefore, these four people found themselves together. Just then, it should be said, literary London still talked of a passage of arms between Disraeli, who had written the Anglo-Hebraic story Tancred, and the lady who at that time was known to be making her studies for a partially Semitic romance which the literary newsmongers had announced as actually in progress, and perhaps within a measurable distance of publication. Amongst other books consulted by her was the Disraelian narrative of The New Crusade, on which she had lately commented in uncomplimentary terms, provoked by Disraeli's disparagement of those who bepraised the Parisian novelists. George Eliot had immediately retaliated that Disraeli himself wrote much more detestable stuff than ever came from a Gallic pen. At the time the affair had attained the dimensions and the notoriety which might have given it a place among those Quarrels of Authors recorded by Lord Beaconsfield's father. So far from causing a contretemps, this was Labouchere's comment on the incident: 'I wished to play the peacemaker in accidentally thus bringing them together.' The beneficent design succeeded to the extent that, without any visibly hostile demonstration, George Eliot, G. H. Lewes, and Benjamin Disraeli, on this evening only, sat close to each other for perhaps half-an-hour. The then lessee of the Globe Theatre felt no doubt all Mr Vincent Crummles's surprise at 'these things getting into the papers.' At any rate, the incident just recounted soon found its way into print, with effects highly beneficial upon the bookings for a theatrical performance associated with such renowned spectators.

Labouchere and Lewis passed away within a short time of each other. Both, as has been said, left their mark upon the fiction of the period—Labouchere in the already-named Daniel Deronda, and Lewis in a clever story from a less august pen. Still, the book in question, Edmund Yates's Kissing the Rod, won the warmest commendation from Charles Dickens, who said, 'You will not find it hard to take an interest in the author of such a work.' The verbal photograph introduced by Yates as a compliment to George Lewis is a mere profile in comparison with George Eliot's elaborately bitter caricature of Labouchere. Yates transcribed every feature immediately from life. George Eliot saw the prototype of Labouchere through the medium of Sir Mulberry Hawke, with his hangers-on, Pyke and Pluck, in Nicholas Nickleby. Sir George Lewis, besides being Henry Labouchere's professional adviser, was, as with his other important clients of the literary and theatrical class, on terms of private intimacy with him. Personally, indeed, the two men had not a little in common. The experiences of neither encouraged roseate views of human nature. The pair, in fact, tempered a cynical distrust of their fellow-creatures by the systematic effort to prevent their becoming worse than they need be. Above all, through much of their lives, the two collaborated for the purpose of keeping the more credulous of their kind on guard against knaves of every sort.

Nature had given them both, in nearly the same degree, a sleuth-hound's scent for the detection of the tempting morsels used by villainy as baits for its traps. They never suspected on the mere impulse of sentiment or prejudice; but, the suspicion once formed, they could lay their hands on circumstantially conclusive proof.

So it was with the Pigott forgeries which victimised the Times in 1887. Labouchere and Lewis had not so much as discussed the subject together, when, by exactly the same independent process of reasoning, they both arrived at the conclusion that the letters foisted on Printing-House Square could not possibly have come from the Nationalist leader. No moral scruples, they agreed, might have kept C. S. Parnell from correspondence with seditious malefactors; but both knew too much of his temper and habits to believe for a moment he would ever have taken the trouble which the correspondence must have involved. Labouchere recalled being with Parnell when a clerk of the Lobby post-office at St Stephen's handed the then member for Cork a six weeks' accumulation of letters. 'You have your work indeed cut out with those,' was Labouchere's natural comment. 'By no means,' rejoined his companion with a characteristic touch of his smileless humour. 'It is astonishing how many letters answer themselves in a month or so.' So, too, Lewis. He had recently met Parnell at the dinner-table of Sir Charles Russell, afterwards Lord Russell of Killowen. Apologising in his saturnine way for only acknowledging his host's invitation by his presence at the hour named, Parnell had gone on to say, 'The truth is, I write, with great difficulty, so painfully crabbed a hand that except on compulsion I never put pen to paper.'

The newspaper charges which led up to the Parnell Commission originated the most famous, but by no means the only, instance of co-operation between the pair, shared in at least once before by G. A. Sala. Labouchere himself, with quaint exaggeration, said of Lewis that he knew, or had in his time known, enough to hang half the City of London. Before practising at the Bar, Sir Charles Russell had been a solicitor. Dwelling on the usefulness of his earliest experiences, Russell once said to me, 'Great as these generally were, I still consider them less than my particular obligations to George Lewis.' By these words, he went on to explain, he meant that, when comparatively new to London practice, he had found the dossier recording the antecedents of all possible metropolitan litigants at the offices of Sir George Lewis; from him, also, he received his first sensational brief. The famous counsel's close connection with Lewis proved fruitful of historical results; for out of it grew the beginnings that resulted in establishing a Court of Criminal Appeal. This, after his experience in the Bravo case during the early seventies, had been the solicitor's favourite idea. Russell always said it was partly Lewis's 'coaching' which had helped him to become the most formidable cross-examiner of his time. He had succeeded Alexander Cockburn as Lord Chief-Justice when his own and the solicitor's efforts were crowned by the institution of the new Appeal Court, to-day the most solid memorial of their life-work. This aspect of a career filled to overflowing with human interest found its exact parallel among the many parts played in his time by Labouchere. Unlike other society journal editors, he was distinguished by the success with which he extricated himself and the little sheet that formed his chief hobby from hot-water. This was due in some degree to his connection with Lord Taunton and to the wealth inherited from him. The two circumstances, combined with his personal acceptance at Marlborough House, gave Labouchere the brevet rank as a member of the titled classes.

His friend Lewis, without any family advantages, owed to his own keen brain and his early professional success Lord Beaconsfield's favour and the Rothschilds' backing. These formed a combination opening to him any social door through which he cared to pass. As a lawyer he gradually won, and never lost, the prestige belonging to one who seldom failed in getting his fashionable clients out of tight places, defying the resources possessed by the

most skilful among the old-fashioned family practitioners. In the division of the High Court of Justice with which business compelled him to be conversant, the central attraction appeared in the united effort of advocate, witnesses, and judge to reveal the process of dragging honourable names through the mire, of unmaking a marriage on which the highest rank and fashion had but recently pronounced their benediction, and of breaking up the home beneath whose roof only the other day they held their feast. As for Sir George Lewis, his reputation came not from precipitating or promoting, but averting, these results. Fame and fortune, far beyond those enjoyed by many of his cloth with a practice scarcely less than his own, came to him not so much from skill in the management of litigation as from the adroitness, the resource, and the flawless integrity with which he led the innumerable well-known personages whoconsulted him from the paths of strife into those of successful compromise.

In delicate affairs of this kind Labouchere often proved his colleague. As social arbiters, indeed, these two had something of a reputation only shared with them among their contemporaries by the two brothers, Generals Charles and Keith Fraser. A rôle of this sort had, of course, long before been played by family men of business in town and country. These, however, had for some time been dwindling in number and aptitude; few or none of them had kept completely abreast of the constantly increasing complexities of the nineteenth century's social system.

Among those to whom Lewis owed some of the opportunities that were the foundation of his prosperity was the fifth Lord Suffield. During the middle seventies the Prince of Wales often witnessed the Oxford and Cambridge Boat-Race from the Thames-side villa of a famous tailor whose hospitalities were eventually acknowledged by an invitation to Sandring-'Well, Poole, what sort of time had you?' asked Lord Suffield on the return of the tailor to his shop in Saville Row. 'Pretty good,' came the answer; 'but rather a mixed lot.' the new problems growing out of that social fusion the old-world practitioner typified by Dickens in the Mr Tulkinghorn of Bleak House had naturally shown himself unequal. The new, fashionable blend of Bohemianism and aristocracy raised innumerable issues on the debatable borderland of ethics and law. These, for their effective treatment, demanded exactly the intellectual suppleness, professional versatility, and good faith which characterised Lewis from the beginning to the end of his career. The thirtyfirst chapter of Wilkie Collins's novel Man and Wife contains an account of the quasi-judicial inquiry conducted by Sir Patrick Lundie into the legal relationship of Geoffrey Dalmayn and Anne. I had it from the author himself, a few years after the novel's appearance, that the whole idea of this episode came to him from a somewhat similar examination undertaken at the request of persons then well known, and conducted by George Lewis in a Mayfair

drawing-room.

Insight into English human nature was, in an equal degree, the speciality of both the individuals now recalled. Both were of British birth, and first saw the light in London. Henry Labouchere had a keen perception of cockney fun or humour on various social levels; George Lewis had always been as much at home with the ethics and philosophy of the London pavement. Yet Lewis's lineage had as little English about it as that of Labouchere himself. Both, by connections and temperament, were cosmopolitans at a time when cosmopolitanism had not grown into the universal craze it afterwards became. The Laboucheres were Huguenots, settled for generations in Holland. Henry Labouchere's grandfather acquired wealth as a partner in the Amsterdam house of Hope. Between 1806 and 1811 Napoleon annexed Holland, together with Westphalia, and made his brother Louis king; the Hopes transferred themselves to London. Their partner, Labouchere, married a sister of the German immigrant's shrewd descendant, who in the middle of the eighteenth century founded the famous firm of Baring. The son by this marriage, Henry Labouchere the first, was born an Essex man; for at Highlands, near Waltham, his father had settled after the flight from Amsterdam. This Henry Labouchere entered the House of Commons during William the Fourth's first Parliament; on the Melbourne Ministry's being reconstituted (1839) he became President of the Board of Trade, with T. B. Macaulay, as Secretary of War, for one of his Cabinet colleagues. Meanwhile he had developed something like a mania for buying land.

He wanted a parliamentary seat, while the Somerset borough of Taunton was on the lookout for a Whig candidate. Leaving Waltham, he went to the west at the same time as his brother John, the late Henry Labouchere's father, settled in Surrey. On his way he had seen Stoke Park, in Buckinghamshire, rather liked it, and at once bought it. Shortly afterwards, finally establishing himself within sight of the Severn sea, he sold this estate, and bought with the money the fair demesne overlooking Coleridge's Stowey cottage and Wordsworth's temporary Alfoxton home. On it he built the existing Quantock Lodge; here, in due course, he became the chief Liberal host of the neighbourhood. Created Lord Taunton in 1859, he had just ten years' enjoyment of his peerage. His only daughter and heiress married Mr E. J. Stanley, whose posterity to-day own and inhabit the really fine mansion which the first and only Lord Taunton built. By a family arrangement, after due provision for his widow, a large portion

of the first Henry Labouchere's wealth went to his nephew, who survived his uncle by exactly twoscore years and two, and his father, Lord Taunton's brother, by very many more. Lady Taunton, the first Henry Labouchere's widow, almost saw the nineteenth century out, passing away about the time of her nephew's retirement to Florence, which place he had always liked, and in which he breathed his last.

Henry Labouchere's inheritance of Lord Taunton's wealth sometimes caused him to be mistaken for his son. Hence one of Labouchere's own best stories—this not having yet found its way into print-may be given here. Henry Labouchere the second made his début in the House of Commons while his uncle, Henry Labouchere the first, remained a front bench man in the Upper House. Soon after his election for Windsor, he was walking through the Lobby one afternoon, on duty bound, when there came up to him one of his constituents, beaming with congratulatory smiles. 'Oh Mr Labouchere, I have just heard your dear father deliver such a beautiful speech in the Peers!' 'My father!' returned the M.P. 'I am sure I am very glad to know; for my father has been dead for some years, and the family cannot but be relieved by knowing he is in so good a place.' I may also correct here the versions of another anecdote much bungled in the newspaper notices.

While attached to the British Embassy at Paris, and greatly enjoying himself in society, Labouchere received instructions to set out immediately for St Petersburg, and report himself to the Foreign Office on his arrival there. Grasping a stout stick in his hand and throwing a bundle over his shoulder, he left his room and went downstairs. About to make his exit by the house door, he found himself face to face with his Paris chief, who asked why he was not already on his way to Petersburg. 'But I am,' came the reply; 'only, having no money, I am obliged to walk. It's a long journey on foot, and if I break down my friends will, of course, hold you responsible.' How far the allegorical element may have entered into the reminiscence one does not know, but this is exactly how Labouchere himself used to tell the tale.

Another recollection of Labouchere has been, while these lines were in process of writing, circumstantially misstated. Who first applied to Mr Gladstone the famous sobriquet of his later years, 'Grand Old Man'? Certainly not, as has been said, Charles Bradlaugh, but that notorious freethinker's colleague in the representation of Northampton—to wit, Henry Labouchere himself—and, as the present writer, who heard it, can testify from personal knowledge, in the following context. Advocating Bradlaugh's claims on the constituency, Labouchere told his hearers Gladstone's farewell words to himself before he had that day started from London to meet his constituents. 'What,' exclaimed Labouchere,

'do you think Mr Gladstone's farewell words to me this morning were? "Labouchere," said that grand old man, "be sure, when you return from Northampton, you bring back with you Charles Bradlaugh."

As a Parliament man, Henry Labouchere was popularly given a place in the list of the Westminster merriment-makers who are to the House of Commons what the comic man is to the private circle. In that capacity the best known of his nineteenth-century predecessors had been Bernal Osborne, whom Labouchere resembled not only in the wit, sometimes biting, sometimes purely facetious, with which he relieved the dullness of debate, but in an instinct for detecting administrative abuses of every kind, whether due to an individual or to a system. Thus the consular service had been disgraced by flagrant incapacity and scandal. Labouchere never spared pains or money in keeping himself well informed about all that happened behind the diplomatic or political scenes. During a discussion at St Stephen's of the Estimates, he showed exactly by whom, as well as how, the leakage and the failure had been caused, and by what means they could effectually be stopped; for, like his friend George Lewis, in all professional matters, Labouchere, when there was real business to be done, worked as hard as a Government clerk on his promotion. In the Villa Christina at Florence, his declining days saw him, while nominally at rest, reposing only in a dog-like tranquillity, and at a moment's notice putting forth all the old energies with the zeal of one whose fortune depended on their display. The biography, for which he bequeathed ample materials to his nephew, Mr Algar Thorold, described how he varied his hospitalities, mostly to Italian rather than English acquaintances, with exhibitions of the same penetration of imposture which more than half-acentury earlier had made his fame. It was his friend Sir George Lewis who during the last year of his life characterised 'Labby's' draft of his niece's marriage settlements as a piece of legal circumspection in which Lewis himself could find no flaw.

The two men now described were essentially the products of the transforming and amalgamating forces peculiar, in their highest degree, to the nineteenth century. Born on the other side of the Channel, they might, by their social success, have degenerated into mere social flâneurs. As it was, they shared and reflected the earnestness, the energies, and the spirit of the society in which they lived, as of the race in which they had become incorporated. Thus, according to their several lights, they laboured not only for the entertainment but for the profit of their generation.

OF THE ONE SQUARE MILE AND OF TWO GALLANT BUT UNFORTUNATE GENERALS.

By Lieut.-Colonel Sir HENRY SMITH, K.C.B.

'WHAT an interesting place the City must be!' said a Scot on a visit to London, who called at my office in the Old Jewry. 'You must know it well.' 'Every yard of it,' was my reply. 'Why, the Tower itself alone, with Tower Hill,' he continued, 'redolent of the headman's axe, and the Traitor's Gate, surrounds it with a halo of tragedy, antiquity, and romance which comes home to every one, be he who he may.' 'Yes,' I said; 'but your premises are not quite correct. Both the Tower and Tower Hill are outside the limits of the City; they are not within the One Square Mile. There is only one part, about two and a half feet wide, on the west side from Lower Thames Street to Trinity Square, that the City can claim.' He was much surprised, and said he believed the majority of people north of the Tweed were ignorant of the fact. 'And south of the Tweed too,' I added. Looking at things from my point of view—that is, from a police point of view—I explained that the City is only a small island surrounded on all sides by the Metropolitan Police District; yet, small though it is, it contains St Paul's Cathedral, the Bank

of England, the General Post-Office, the Mansion House, and many buildings of great antiquity, notably the Halls of the Livery Companies.

It was in one of these Halls that I met the two gallant but unfortunate soldiers, Sir Redvers Buller and Sir William Gatacre; but, before giving details of that meeting, it may interest my readers if I describe a few of the Halls in question. With the exception of the Merchant Taylors', the Clothworkers', the Ironmongers', the Leathersellers', and perhaps some others, nearly all were burnt at the Fire of London, and rebuilt between 1666 and 1680. The Ironmongers' Hall has been rebuilt within the last hundred years; so also has the Clothworkers'. The Leathersellers' was rebuilt during the latter half of last century, the Clothworkers' at about the same time. The Grocers' has been entirely rebuilt during the last twenty-five years. Among Halls which may be designated as 'modern' are the Clothworkers', the Mercers', the Grocers', the Fishmongers', and the Goldsmiths', all of which have been rebuilt within the last seventy years. A few of the Halls are partly 'ancient' and partly 'modern;' that is, some of the original building remains, while a portion has been added on to them within comparatively recent times.

But it is with the Skinners' Company and the Merchant Taylors' that we have to deal in this retrospect of mine. We read in Peveril of the Peak that the streets of London were not safe about the year 1680, with the Duke of Buckingham's intimates about, as Julian found to his cost when escorting Alice Bridgnorth and Fenella through them. In the Fortunes of Nigel, Sir Walter gives an interesting account of the lawlessness that prevailed in the streets of the City at the beginning of that century: how the 'prentices often, in crying their wares, took liberties with and insulted the passers-by:

Up then rose the 'Prentices all Living in London both proper and tall,

with the cry to each other of 'Prentices, clubs! Desperate riots would frequently ensue, the bare steel of the aristocrats being opposed to the clubs of the citizens.

As it was in London so it was in Edinburgh in those times of discord and bloodshed. When two clans met with an old feud outstanding, like the Leslies and Seytons—vide The Abbot—they fought to a finish in the closes and narrow wynds of the High Street

of Edinburgh.

Long previous to this epoch—I cannot venture to say how long—a deadly feud had existed between the Skinners and Merchant Taylors. They never met without a fight, and corpses lay thick in the narrow streets. This feud must have been of very long standing, for it was in 1484 that the then Lord Mayor, from the best So it is recorded. of motives, interfered. Another authority avers-where I have read this I cannot recall to mind—that the Lord Mayor had nothing to do with the reconciliation; but that the Masters of the two companies, both being men of courage, tact, and discretion, having spontaneously approached each other and met, decided that fighting had lasted long enough, that the hatchet must then and there be buried, and that, in token of amity and good-fellowship, the companies should entertain each other in alternate years; the Skinners being the hosts one year at their Hall in Dowgate Hill, and the Merchant Taylors the following year being the hosts at their Hall in Threadneedle Street, the toast of the evening being 'Skinners and Merchant Taylors, Merchant Taylors and Skinners, root and branch, may they flourish

Old customs die hard in the City; in fact, they don't die at all. When dining with the Salters' Company in St Swithin's Lane, each guest is still presented with two bone saltspoons. How this custom originated I have been unable to ascertain.

The evening to dine at the Fishmongers' Hall, London Bridge, one of the prettiest and most spacious of the modern Halls, is that on which the winners of Dogget's Coat and Badge attend in their uniform to receive their prizes. Competitors are limited to Thames watermen in the first year out of their apprenticeship, who have taken up the freedom of the City. The race, from London Bridge to Chelsea, is rowed on the 1st of August, the prizes, six in number, being from ten to two pounds.

But revenons à nos moutons.

The gallant Buller arrived in London from South Africa towards the end of the year 1900. Just about the time he landed I had occasion to seek the advice of a solicitor in Essex Street, Strand, with whom I was closely connected in matters of business, and who was an intimate friend 'forby.' Business over, he told me he was Master of the Skinners' Company, and that he, in their name, had invited Generals Buller and Gatacre to dine at the Hall next month—to be accurate, on the 6th of December. 'Will you come and meet them?' 'With very great pleasure,' I replied.

That night, for more than one reason, I shall never forget. The cold was intense. '7 for 7.30' is generally the hour for City banquets. I lived in the far west, and dressed leisurely, thinking I had plenty of time; but snow began to fall, and continued till it lay to the depth of quite two inches, with a strong gale, nearly a blizzard, blowing from the east, which the wretched old four-wheeler-save me from 'hansoms' on such a night!-brought to the door by my man, had to face. The miserable old quadruped in the shafts, after falling on his knees several times, eventually brought me to Dowgate Hill, and thankful I was to get under the awning stretched across the pavement. On entering, I saw General Buller, who must have had quite as long a drive, shaking the snow off his heavy greatcoat. To be late is, in the City, an inexcusable fault; and though I was apparently the last arrival, I was relieved to see I was in time, for the clock struck the half-hour as I alighted. As I followed Sir Redvers up to the drawingroom, where our hosts were standing to bid us welcome, an odour of exquisite cookery permeated the whole building, grateful to him, I should imagine, after months of tough ration beef, and grateful to any hungry man; an odour of a dinner the description of which, as dear old Caleb Balderstone said when enumerating the delicacies of the 'thunder-blasted' dinner at Wolf's Crag, 'wad ha'e made a fu' man hungry.' No time was lost. There was much to eat, much to drink, and two speeches at least, with probably one or two more, to get through. A plan of the dinner-table, with his seat marked by an x, having been handed to every one, as is the custom at the Mansion House and most of the City Halls, our names were called out in order of precedence, and we descended to the dining-room. The company, all told, numbered

some sixty or seventy, two-thirds being Skinners and Merchant Taylors.

Everything has an end; and at last our dinner came to a conclusion. The 'loving cup' having circulated and been removed, the chairman, with the Lord Mayor on his right hand and the guest of the evening on his left, at once rose, and in a few well-chosen words proposed the health of 'our gallant General, whom we are thankful to have again with us, and whom it is our pleasure and privilege to entertain on his return to his native land after the most arduous time which any British General since the days of the l'eninsula has ever passed through.'

Without a moment's delay the Field-Marshal sprang to his feet, as did also Sir William Gatacre, close to whom I was sitting, and some ten or twelve other 'soldier officers.' I saw the mistake they were making, and-to borrow a phrase from the card-table-'sat tight.' Buller looked annoyed, and in somewhat peremptory tones, accompanying his words with a wave of the hand, exclaimed, 'Sit down, Gatacre; sit down, man. You miss the point. I am not returning thanks for the army. I am returning thanks for myself.' Gatacre obeyed, apparently with reluctance, followed by the others, who subsided, not very gracefully, upon their chairs. Buller-I ought to have said-was cheered to the echo when he rose. Thirteen long years have come and gone since that night; and, though I cannot repeat the ipsissima verba uttered by him, my memory is a retentive one, and I can even now remember what he said in his speech on that—to me, and I believe to all present-most interesting occasion.

Addressing us in that rugged and determined fashion characteristic of him, he did not show one trace of emotion save when-But I am 'My Lord Mayor and Gentlemen,' anticipating. he commenced, 'six months ago I never expected to see Merrie England again, or the green hills and undulating slopes of my beloved Devon. I was placed in an untenable position, from which I saw no possibility of escape save by death, or what was worse to me, a soldier-pardon me for reminding you of it—who had won renown on many a hard-fought field without ignominy and disgrace. I had no one to take counsel Some men take counsel with their wives; my wife, had she been present, would not have failed me' (loud cheers); 'but she was thousands of miles distant, I was thankful to think, from such scenes as we were passing through. Some take counsel with their juniors.* I have never done so; I may be wrong, but I do not approve of it. I had to face the music—to use an expression much in vogue-alone. But I am detaining you too long, and must hasten to When things were at their very conclude. worst I got a letter-it took long to reach me -from my friend here,' laying his hand on the shoulder of the chairman, 'in which he expressed the hope that I would honour-for so he was kind enough to put it—the Skinners' Company by dining at their Hall on my return to England. That letter, gentlemen, was a great comfort to me, showing, as it did, that there were some who believed I had endeavoured to do my duty, and who refused to believe that I was ever actuated by any other feeling than loyalty to my King and country.' Here it was that Buller faltered, and was unable for some few seconds to continue. The cheers that came from all at table, renewed again and again, gave him time to recover, and he concluded ruggedly and determinedly as he had begun. 'Gentlemen,' he said, 'I thank you from the bottom of my heart for the kindness you have shown me, and for the confidence you evidently place in me; and, late in the day though it be, I hope, with God's help, to prove that your confidence is not misplaced.

Shaking hands with the chairman and with a few of us who were at the top of the table, the General made his way to his carriage arm-in-arm with Gatacre; the cheering in the street being to the full as hearty as it had been inside the Hall.

I feel impelled, before bringing this retrospect to a close, to write very briefly of that other distinguished, but also unfortunate, soldier, Sir William Gatacre. To judge of a General, ask the rank and file what they think of him. Buller, 'the soldier's friend,' was accused of recklessly throwing his columns forward to certain death; so was Picton in the Peninsula; so was Napoleon on many occasions, notably at the Bridge of Montereau. Gatacre in his forced march to the Atbara was accused of cruelty to the brigade he

permission to go round with him, which he readily accorded. The day was wet; pools of water lay everywhere, and the turf was saturated and sodden. The first hole the champion played perfectly; then his troubles began. The second hole, in good weather, was an easy four. John made a beautiful long drive from the tee, but when we got up to his ball we found it lying about as badly as it could lie—only half of it was visible. John looked anxious, not to say careworn. Stretching out his hand he took hold of a club, but was promptly checked. 'That's no the club frace a lye like that.' Hesitating for a moment, John yielded, and a beautiful stroke was the result. Champion and caddie smiled 'tae ither.' As we walked forward to the next tee John said to me, 'This is an awfy drive wi' the wind against ye; there's nacbody here the day that can carry that barrin' mysel' and Tom,' an Englishman who was following us. Here again the champion and his caddie differed, and here again the champion and his caddie differed, and here again the champion and his caddie differed, and here again the champion and his caddie differed, and here again the object of the reply; 'that's the club for ye.' Again John yielded, and again the boy's decision saved the situation. 'D' ye think A dinna ken the club ye want?' contemptuously. 'Ye're aye that obstinate.'

^{*}In this respect Buller was very different from a distinguished golfer whom I knew. Nine years ago—if my memory serves me right—the greatest professional golfer, to my mind, of modern times, John Blank, let us call him, came down far south to a green which I used to frequent, to take part in a competition for fairly valuable prizes, not within 50 per cent of such as are offered nowadays. He was accompanied by a diminutive caddie, apparently of about thirteen summers, though it is possible he may have been older. Being a 'brither Scot,' I asked the champion's

commanded. Buller's men knew full well he would never send them where he would not go himself. His buglers could sound en avant; the retreat they had not learnt. Gatacre's men walked the soles of their boots off, and struggled on with feet torn and bleeding, because they were determined to do what their dearly loved Brigadier required of them.

Buller and Gatacre, it may be said, were similarly situated from several points of view: adored by their men, as I have endeavoured to show, and loved by their wives as, I had nearly said, few husbands are loved. Lady Buller would have fought to the death had the good name or loyalty of the General been called in question. The Life of Gatacre, written in his defence by his widow, Beatrix Gatacre, could not be surpassed in affection and devotion. To quote from that Life: "He is the soldiers' General," I have heard rapturous Tommy ex-

claim.' And again: 'General Gatacre had half-a-dozen chargers. Every one was carrying a barefooted soldier, while the General trudged with his men.' And yet again: 'The men learnt to work because the General expected it of them.'

Gatacre was removed from the-command of his Division by Field-Marshal Lord Roberts, the order being dated Bloemfontein, 16th April 1900. We cannot doubt for a moment that the Field-Marshal bitterly regretted the necessity for the action which he felt himself impelled, in the interests of the Service, to take; but it is indescribably sad to think that such a soldier, with such a record, ended his career in what might be called civilian work, far from the land he loved and far from the wife who would willingly have laid down her life for him.

Buller and Gatacre were heroes indeed.

Requiescant in pace /

A PLEA FOR THE DEFENCELESS.

THE Wild Bird Protection Orders have admittedly put a stop in many counties to the slaughter of birds that need protection. The contradictory practice in different districts has admittedly impaired the efforts of bird-protectors. It is regrettably the case, yet under the present system inevitable, that laws for the protection of bird-life are often beset with anomalies and contradictions. For instance, one county calls for withdrawal of the close-time protection for the black-headed gull, and another asks for an order to protect the same bird all the year round. The committee which the Home Secretary has appointed to inquire into the working of the Bird Protection Orders will, it is hoped, be able to make recommendations which, while removing anomalies, will meet the required protection of the various species of birds throughout the United Kingdom. The Plumage (Prohibition) Bill, at present under consideration by the legislature, is demanded by ornithologists, men of science, and humanitarians throughout the world, who have with single-minded purpose and concentrated power fought and exposed the methods of wealthy dealers in the plumage of rare birds. The Government, in framing the Bill, it is reasonable to assume, has not accepted without independent inquiry the evidence either of bird enthusiasts or of those financially interested in the exploitation of the white heron, the Smyrnian kingfisher, the Goura pigeon, the albatross, and other rare species, now threatened with extinction. Not merely in tropical countries, but in our own, precious species are in danger of extermination. The Shetland County Council has passed a resolution that the great skua should be excluded from the list of protected birds. To deprive this bird of protection

would be an unpardonable sin. It is easy to make allegations, but not so easy to prove them. It is argued in support of the plea for exclusion that the skua is responsible for the destruction of goslings; but the alleged predatory habits of the bird in this connection lack corroboration. Under the new Grazing Regulations, The Scottish Naturalist points out, 'no geese are to be allowed on common pasture; so, even supposing the guilt has been proved against the skua (and there is no proof), it could not happen again. It would be nothing short of a tragedy if the protection were removed, as the skua would be killed out in a year or two.' The introduction of the Plumage Bill by a Cabinet Minister is at once an admission, and a welcome one, that bird-lovers have fully established their case. To aid the passing of the Bill into law should be the congenial task of men and women who feel that the riches of nature are held in trust for the present and future generations.

THE NIGHTINGALES.

I LISTENED to the nightingales
Till all my soul grew sore;
It seemed as though the thorns of song
Were stabbing to the core.

All through the dusky, silent hours
Those canticles of pain
Were chanted by the cloistered choir
Again, and yet again.

Oh singers! singing in the night,
While the world waxeth old,
No bead on Sorrow's rosary
By you is left untold.
M. HEDDERWICK BROWNE.

THE HEART OF THINGS.

By HENRY LEACH.

LONDON, Yesterday.

NOW, when the spring awakes, the people of our islands begin to move long distances again in the way of travel. It were better perhaps for their gain of sunshine and of strength of mind and body that they moved more in the winter, and held themselves at home when the climate of Britain is most tolerable; but save for those of some wealth and leisure, who wander to the Riviera and to Egypt in the cold, the dark, the wet, the windy months, the idea of the winter holiday has not become attached to our people, and perhaps never will be. With the Americans and the Germans it is already different. It is they who, with the British, travel most in the winter or spring; the Germans having advanced strongly in this matter during the last four or five years, as they have come to consider themselves a wealthy, successful people, with considerable possibilities of great empire. They have put it to themselves that they should go about the world, and that is why in these times you will find the Germans nearly everywhere to an extent that they were not even so recently as the beginning of this century. As a traveller, I cannot persuade myself that the change is agreeable I am an admirer of the Germans. They are a fine, a great people. They embrace the best spirit of modern times, refined and well balanced; but, in the British way of looking at things, they are not good travellers yet, and never will be. They are too aggressive, too selfish, too careless of the feelings of other people. They do not grasp the principle that to the traveller all the world is home, and manners should be always nice. They are rough; they trample heavily along; and I hope to see more and more hotels with such names as Kaiserhof erected for their exclusive use, as is becoming the modern way. The German has come to be a great force in all modern travelling considerations; he counts nearly equal to the American. But what is more especially to be said about these Americans and Germans is that, while of course hundreds and thousands of them wander far afield in the summer-time, the proportion who make their travellings in winter is enormously greater than with British people, and this is not done without a reason, and a good one. We ourselves stay in our own country when it is least pleasant, and

we visit others when they are less attractive than at other times. We lose on the change both ways. This circumstance was impressed upon me forcibly, and in a curious way, one day last February, when I happened to be on a little steamboat that was striving its way from Naples to the pretty island of Capri. It was a day that seemed to have been lent to the world by heaven itself—the sweetest sunshine, the bluest sky, a sea of liquid sapphire completely transparent, and a sparkling, life-giving atmosphere which seemed to make existence move to music. It occurred to me suddenly, as the people began to make inquiries of our Italian skipper about the prospects of entry to the blue grotto that day, that there were not many British among us on this little ship of wandering folk, and, the impression making a greater curiosity, I set myself to a little private census carried out unobtrusively. There were, I discovered, thirty-one first-class passengers on the ship. Eleven were Americans, seven were Germans, four were French, two were Hungarians, two were Italians, one was a Russian, and I alone was British. This statement accounts for only twenty-eight. were three other men who walked up the hill of Capri just before me whom I could not determine, and they were spoiling the completeness of my work. So, with an apology, I asked them what they were, and they said they were Scandinavians -men from Sweden. One British man!

* * *

And yet Italy could hardly be sweeter, more glorious, in May than she often is in March. is to Italy that the average traveller who likes to wander over Europe first turns his mind and then his steps when the spring-time comes. It is inviting then as other countries are not. It is a good thing that people go so much to Italy as they do; it will be well when they go still more. Above everything, one feels that in this age, and with the tendencies that exist in the world to-day, it is desirable that all people concerned with life and movement should be given a course of study and observation of the Italy of the past as it still is at the present time. brings up sharply those who have ultra-modern ideas about advancement and twentieth-century greatness and achievement to a knowledge of our APRIL 25, 1914.

No. 178.—Vol. IV. [All Rights Reserved.]

present deficiencies and of our increasing coarseness and vulgarity. Of all countries in the world, Italy is the best for a pleasant, most entertaining, and instructive holiday. It teaches more than any other country can about the wonders of the world and the possibilities of mankind and the beauties of life. Italy also presents in a small space such a variety of scene and study as is hardly to be found in whole continents elsewhere. You may enter the country from the French Riviera, and, after lingering at Bordighera or San Remo, may move to Genoa, a splendid study of a seaport, full of life and bustle and inspiring memories as of the place where Christopher Columbus was born. Genoa in these days seems to suggest a new life for Italy; it seems to be leaping to a new greatness. Then what a charm in the Levantine coast! The quaintness, the sleepiness of Pisa! And the glory and the richness of Florence! How, when others made all Italy and the world outside shake and shiver with their tumults and their wars, those old Florentines could all the time care less for war than for other things in life, could clamour always for culture and beauty, and more beauty, and the constant expression of it! Theirs was the higher life as no community has ever led it before or Art and feeling seem even now to be exuded from the very stones of Florence; the Arno, as it goes tumbling through the bridges, almost sings of the fine life that was lived by its banks in days gone by. It is now just a part of big United Italy; but a wanderer who stays there for days enough, which need not be many, can still feel something of the idea of old Florence stirring about him—the colour, the idealism, the soft, rich glow of life when thought and beauty were so much. For the moment pass Rome by, and look on Naples. For myself, I cannot perceive that there is then any need to die; but Naples, in a plainer, far coarser, more elemental way than other parts of Italy, exhibits the heat and colour of passionate, throbbing life. You must hear the Neapolitan love-songs sung in Naples to know their possibilities, must listen to a full-throated fellow giving out the melody of the barcarolle called 'Santa Lucia,' known over the world, though not so well by name. From a day in Pompeii you may come to understand how the Romans who tarried there in the summer-time set out to enjoy their lives according to their own ideas in a manner thorough and complete. But as I move in a state of wonder and inquiry, what impresses me most about Naples in these days, considering it as a part of Italy, is its harsh difference from the rest, its comparative coarseness, its apparent unsuitability to the new Italian amalgam. There are other parts of Italy that are rough and simple and fleshly just the same; but Naples does seem to stand out in more contrast than any other section of the country.

It is here that we realise the enormous

problem that was set, and is still being grappled with, by the statesmen artificers who have been making up one country from all these separate pieces in that long leg of land in mid-Mediterranean. The foreign people of to-day hardly grasp the fact that Italy did not exist a little more than half-a-century ago, that up to then there were a number of states that were constantly in difficulties with themselves and with other countries, and were suffering badly as the The declaration that for their common result. weal all these countries should henceforth be one and united, under one law, one king, was one of the most risky and doubtful experiments in country construction that rulers and statesmen have ever undertaken, and none the less so for the fact that Italy at that time was in a very hopeless state of inefficiency and poverty. It seemed like trying to make a nation out of a few rags and bones. For a long time the experiment seemed likely to fail; and it may be said that the real forward movement of United Italy, the actual materialisation of itself as a new and appreciable country, dates only from the beginning of the century. Italy is advancing now; of that there can be no doubt. To celebrate half-a-century of her unity she has erected in the Piazza di Venezia in Rome one of the grandest monuments the world has ever seen, a magnificent structure in white marble with a colonnade that seems almost to be pillared in the sky, and before it a gilt statue of the first king of the United Italy, whose horse seems to be exultingly prancing to the freedom of space. This immense monument, which has already cost nearly two million pounds, subscribed to by every part of Italy, and not yet quite finished for all the years that have been given to the work, is nominally, as I have said, an emblem of the unity of Italy; but in their hearts the Italians know it to be there for another reason which they hardly like to whisper. They have now a tremendous belief in their own future; they believe that from the troubles that will soon beset Europe they will emerge the gainers; they are playing a diplomatic part that is crafty and careful, and they are going about their business warily in a manner of expediency and with some energy. Get at the thoughts in the corners of their minds, and you will find that these Italians believe that now that their unity is in working order, they have an enormous future before them as one of the greatest countries of the world. Their optimism is immense. Such optimism is a fine thing in its way; but it is a peril when it is so strong that the people relax their active efforts in supporting it by work, and the Italians are now somewhat inclined that way. They seem to believe that glory is their destiny, and I am persuaded that this instinct has had something to do with the magnificence of the monument, that they have been in the way of counting their

chickens before they were hatched, and that this is more of a monument to the future greatness of United Italy than to its late achievement in gaining its unity. At dinner-tables in Rome we are in the habit in these days of discussing many pretty points in connection with this monument. Is it fair to the Cæsars that these moderns, who after all have done so little as yet, should build up a monument so much grander in its way than anything that was ever raised in ancient Rome? Does it seem in the best of taste? Should it have appreciation from us foreigners? Is it not really too gorgeous for anything, too immodest, a little stupid in the circumstances? The Italians accept all such challenges, and they deny the suggestions. They claim now to be a nation in action and heading for a great destiny. They say that the unity of Italy was a magnificent achievement, and they are determined to make good on that monument. In a sense it commits them, for if in two or three generations from now Italy has not gone forward marvellously, there will surely be Italians who, to save their blushes and their shame, will pray for an earthquake in the Piazza di Venezia. In the meantime, let it be said for them that a close study of Italian character and the circumstances of the case leads to the belief that they will indeed make good; but for their own sake one would like to see them determine that an honest helping hand should be given to fate and destiny, and that faith in the future should not be so idle and so blind. But the point that led to this consideration was the original difficulty of uniting Italy, and the fact that that difficulty can still best be appreciated by the wanderer who goes to Naples, especially if he travels there from Florence. The difference between Constantinople and Chicago is not greater than the difference between Florence and Naples. Natural beauty, but no other, belongs to Naples; it is a wild, rough, ill-mannered place, that would be better in a lonely part of Spain than where it is. In their ways and tastes the people have nothing in common with the people of other Italian states. They live a primitive life, and have their own customs. In a main street you may see the outside doors open to people's bedrooms, the bedclothes themselves may flutter through the door, and a passing dog may look inside in the usual way of canine curiosity. Any number of these front ground-floor sleeping-rooms are mixed up in this main street with shops for the sale of meat, clothes, and other commodities. In the morning and afternoon the dairymen lead their cows and goats down the alleys and the streets, and milk the quantity of fluid required by each householder in the jug presented. All this and much besides is the exclusive Neapolitan way, as I have seen it, and wondered. It is a different Naples from that which might be imagined by those who have only thought of the 'Santa Lucia' and the love-songs that come so hot from the heart. Yet, do not think that any of us, whatever our taste, should dislike Naples. Here, as elsewhere in Italy, all the people live; they feel the throbbing of existence in a way which it is doubtful if any other people of any other country in Europe do. Only, the Neapolitans get the human satisfaction in more elemental ways than their northern associates in United Italy.

ciates in United Italy. If there is what might be called an impossible difference between Florence and Naples, there is one that is at least as incomprehensible between Venice and Naples. The majesty and dignity of Venice in those old days, the tremendous strength of its life, must have been one of the most magnificent things in the world. And as we wander from place to place in Italy, look in at Perugia and Verona, and for a rest at the end wander upward through Milan to the lakes, the impression of our modern inferiority and coarseness is piled higher and higher in our minds all the time; and, along with it, there is the other impression of the infinite and almost confusing variety of this long, thin country that is called Italy, and of the enormous difficulty that there must be in uniting it. So great are the contrasts, so different is the life that is led in different parts, that unity does seem impossible. I can imagine it as easy to achieve the United States of Europe as it is to get to the completion of United Italy. And yet it is being done, and because of that I feel that we are within thinking distance of the United Europe. The peoples are still reluctant to mix and blend. The Piedmontese hate and despise the Neapolitans; with the Venetians and the Florentines it is the same. Lombardy likes not Tuscany; there are rivalries and dislikes all through the sunny land. But still the idea of the necessity of unity is slowly gathering strength; and the recent Libyan war, in which the soldiers from the different parts fought side by side, has done very much to help forward the national spirit. So for art and the enlightenment of the mind, for political and sociological study, for a tonic medicine that will bring us to a proper view of the comparative merits of different ages, and especially of the relation between the first century, the fifteenth, and the twentieth, Italy is better indicated than any other country. In these days travel is such an easy thing that it comes almost to be despised. The tour of the world will never lose its value; but it seems to me that, so far as the observation of countries is concerned, what the people in them have done, and what they are doing, a very complete knowledge of the world can be obtained from a close and observant examination of life and things in two only. Those two are the United States of America and Italy. They stand for the palpitating present and a magnificent past. They are the absolute complements

of each other. One is for materialism and the

body; the other was for glory and the soul. They are the extremes, and each in its way is grand, magnificent. A man of sense and feeling may have a pleasant and interesting hour with himself in considering whether, if he had had a choice in delivery from the womb of time, he would have declared for early days in Italy or the twentieth century in America. I think I know to which side the majority would give their favour. I am not thinking lightly of those United States across the sea, a magnificent country for which, knowing it well, I have the most enormous appreciation. It stands for the new idea of life, as necessitated by changed circumstances, better than any other country in the world to-day. I think only of the quality of life at its own special time and place. was in doubt about his decision I should recommend to spend a month in Rome and another month in Florence. Perhaps, his instincts being slow, he might still be undetermined, and would need to be sent for another trial. There is a final test, and it would rarely fail. morning of a sunny day we would lead him out from Rome to ancient Tivoli, by the side of the Sabine hills. For a while we would dawdle above and below the tumbling cascades that are This touch of strong nature brings a certain tranquillity and detachment to the mind. Then we would take our doubting friend to the Villa d'Este, near to the middle of the little town -the beautiful place that was made in the middle of the sixteenth century for Cardinal Ippolito d'Este, Governor of Tivoli, who was the son of the Duke of Ferrara and Lucrezia Borgia. Here, for their happiness, their pleasure, their fine display, and their half-intoxication with the strength and beauty of life as they knew it, came in those days emperors, popes, cardinals, princes, dukes. Glittering pageants then. Art of the Renaissance shaped and adorned this palace sumptuously, and from its balconies and terraces there is a view over the Campagna and all the way to Rome that, of its kind, is not to be equalled. But the gardens have enthralled me more. In their beauty, their refinement, their imagination, and their perfection of design and detail there is nothing like

Here, indeed, have the ingenious artists given the ultimate thought in beauty to marble sculpture and tumbling waterfalls. The vistas, the end-pieces to the walks, the prospects high and low, and the path of the hundred fountains are sublime. But their chief merit now is in the imagination that they stir. It is inevitable as we linger here that we picture the magnificence of the times for which the gardens were made, and of the colourful life that then was lived. Here was beauty; here indeed were refinements, and pleasure for the nicest æsthetic senses. Can it be that the splendid people who lingered here knew or could imagine anything that they might covet? Their ideals may not have been the same as ours; but according to theirs they lived their lives to the utmost, and indeed they knew what beauty was. They treasured riches, but they cannot have been so materialistic as we are now. They felt a warmer glow of life. Yet there is that tremendous advancement which we are understood to have made. There are the aeroplanes. Near the horizon from Tivoli I could see two great, silver-skinned, pike-nosed airships belonging to the Italian Government that were circling out in the air from Rome. There are the motor cars. How would the Cardinal Ippolito and his guests have sped away across the Campagna between the Villa d'Este and their Rome! Instead they idled and talked, and no doubt they intrigued in their garden. Their existences were graced most beautifully. How for the beauty and enjoyment of life have we improved by steam and electricity and motorcars and aeroplanes? Has colour gone out of the world, and has there come a harsh jangle and confusion in its place, and an insistent materialism? Of course it was inevitable; it is necessary, but it is sad. In the nineteenth and twentieth centuries we have made a fearful lapse toward barbarism. I should not wonder if the doubter, now converted as he emerges from the Villa d'Este, would prefer to tramp on foot a few miles along the road to Rome, instead of taking the Italian tram from the beginning. He will wish to think, and the sight of electric cars will be out of harmony with his thoughts. For myself, I walked five miles.

A KNIGHT ON WHEELS.

CHAPTER XX.-PLAIN MEN AND PRETTY WOMEN.

A FORTNIGHT later Philip filled the vacancy which had been caused two years previously by the removal of Mr Atherton by offering the post to Tim Rendle, an offer which was accepted by that ornament of the leisured classes with an enthusiasm which would have surprised the horny-handed Brand.

The experiment turned out a complete success. It provided Master Timothy with some muchneeded employment, the Britannia Motor Company with an admirable addition to its staff, and Philip with a companion. Tim was a capital salesman. He soon became a brilliant, if slightly reckless, driver; and in time he

I.

absorbed a fair working knowledge of the mechanics of the automobile. He possessed a charm of manner of which he was quite unconscious, and a unique capacity for getting himself liked. He fell in and out of love on the slightest provocation, and rarely failed to keep Philip informed of his latest entanglement.

Once he offered, as a supreme favour, to introduce Philip to one 'Baby,' who presided over a tobacconist's small establishment in Wardour Street. The interview was an entire The siren greeted Timothy and his failure. abashed companion most graciously, and was on the point, doubtless, of making some witty and appropriate remarks, when a piano-organ came heavily to anchor just outside the door, and its unwashed custodians proceeded to drown all attempts at conversation with the reverberating strains of 'Alexander's Ragtime Band.' Under such circumstances it was impossible to look either affectionate or rakish. A conversation conducted entirely by means of smiles, however affable, and nods, however knowing, rarely leads anywhere; and Timothy, having intimated by a tender glance in the direction of Baby and a despairing gesture towards the door, that his heart was for ever hers, but that for the present they must part, the deputation filed ignominiously out, one-half of it feeling uncommonly foolish.

Tim was fond of engaging in controversy with Brand, and Philip frequently overheard such epithets as 'gilded popinjay' and 'grinder of the faces of the poor,' exchanged for 'dear old soul' and 'esteemed citizen,' on the occasions when argument and chaff clashed together in the garage or showroom.

Tim created an impression in another quarter too, as a brief scrap of conversation will show.

'I think, Miss Jennings, that it would be a pretty and appropriate thought if, for the future, on arriving at the scene of my daily toil I were to kiss you good-morning.'

'Think again!' suggested Miss Jennings.

'Not necessarily for publication,' continued the unabashed Timothy, 'but as a guarantee of good faith. A purely domestic salute, in fact. These little things have a softening effect upon a man's character.'

'They seem to have had a softening effect upon your brain,' countered Miss Jennings swiftly.

'It would do me good,' urged Tim. 'I have no one to kiss me now that my dear mother has been called away.'

Miss Jennings looked up, deceived for a moment. 'Is your mother dead?' she asked more gently.

'Oh no. She is very well, thank you,' said Tim.

'But you said she had been called away.'

'So she has.'

'Where?'

'To Holloway,' explained Tim softly. 'She is a Militant. She tried to burn down Madame Tussaud's. I miss her very much,' he added with a sigh. 'She comes out about twice a week, under the Cat and Mouse Act. I meet her at the prison gate with sandwiches, but she never kisses me, because her mouth is too full. Will you?'

'It seems to me, Mr Rendle,' remarked Miss Jennings, scarlet with indignation, 'that you and I are wasting our time. I have some work to do for Mr Meldrum. I'll trouble you to get

out of this office into the showroom.

'Certainly, Miss Jennings,' replied Timothy, striking an attitude. 'Good-bye! I will face this thing like a man. I will fight it down. I shall probably go and shoot big game—in Regent's Park. May I send you a stuffed elephant! Or would you prefer a flock of pumas! I don't know what a puma is like, but the keeper will tell me.'

The clatter of the typewriter drowned further foolishness, and Timothy departed to his duties. Here the incident would have ended but for Miss Jennings' feminine inability to leave well alone.

'Haven't you got a young lady of your own?' she inquired next day of Tim, à propos des bottes.

'Yes,' said Tim rapturously, 'I have.'

'Then why'----

Timothy hastened to explain. 'Because I haven't met her yet. You cannot expect a lady to kiss you for your mother,' he pointed out, 'until you have spoken to her. The object of my affections lives in a castle in the air, and she has never actually come down to earth.'

But Miss Jennings' attention had wandered. 'Kissing is a queer thing,' she said musingly.

'It doesn't seem so after a while,' Tim hastened to inform her.

'If you had got a young lady of your own,' continued Miss Jennings, evidently debating a point which had occupied her attention before, 'and you were to kiss another one, in a manner of speaking there would be no harm done.'

'None whatever,' agreed Tim heartily.

'What the eye doesn't see the heart doesn't grieve over,' continued Miss Jennings sententiously.

'Selah!' corroborated the expectant Timothy. 'But if the eye was to see—my word!' Miss Jennings inserted a fresh sheet of paper into the typewriter, and continued: 'Seems to me, kissing another young lady's young gentleman is just like picking up her cup at tea and taking a drink out of it. If she don't get to know about it, no one's a penny the wiser or a penny the worse. But if she does—well, she feels she simply must have a clean cup! So don't you take any risks, Mr Rendle. You've such a silly way of talking that I don't know whether you have a young lady or not. If

you haven't one now, you will have some day. If you have—one that's at all fond of you—and go kissing me, you will be sorry directly afterwards.'

'The Right Honourable Lady,' chanted the graceless Timothy, 'then resumed her seat amid applause, having spoken for an hour and fifty minutes. Very well, I will leave you. I shall go and hold Brand's hand in the garage. He loves me, anyhow. Hallo! I say'——

Miss Jennings' serene countenance had flushed

'Have I said anything to offend you?' asked Tim, in some concern. 'I was only rotting, you know. I had no idea Brand was a friend of yours.'

Miss Jennings, recovering herself quickly, replied with some asperity that Brand was no such thing, and again announced that she had some work to do, and that the conversation would now terminate.

But it did not. There was a magnetism about Tim which invited confidences.

(Continued on page 342.)

A NEW ARCTIC ISLAND.

By DAVID MACRITCHIE.

So much has been achieved by exploration, especially during the last hundred years, that nearly the whole world is open to examination on the map. There are still, however, large areas in the Polar regions over which the word 'unexplored' can fitly be written. True, the Poles have actually been reached, but only by 'dashes' made in a straight line. Immense tracts around the Poles have yet to be mapped out. This is particularly true of the Arctic area; for the general configuration of Antarctica is known, although innumerable details remain to be filled in. Consequently there need not be much surprise at the recent announcement that a hitherto uncharted island has been discovered some four hundred miles north of Cape Chelyuskin, the most northerly point of Asia. The discovery is of great interest, nevertheless.

The information so far furnished to geographers is meagre but definite. It is to the effect that a Russian naval officer, Captain Wilkitzky, in endeavouring to bring his ship westward from Behring's Straits to Europe, was obliged, owing to a vast ice-pack which blocked his way, to steer due north from Cape Chelyuskin, through a stretch of open sea. Somewhere between the eightieth and eighty-sixth parallels he reached the coast of a large island, so large that he traced it in a north and north-westerly direction for about two hundred miles, apparently without ever rounding any important promontory. Our first intelligence of the discovery, conveyed through the New York press, spoke of the island as being of the size of Greenland. This statement was at once discredited, for excellent reasons. Greenland has an area of six hundred and eighty thousand square miles, and there is no room for an island of equal size in the unexplored regions of the Arctic. Even if space could be found for it, by the most careful 'jigsaw' method, its mountain ranges would have been sighted long ago from one point or another of known territory. Moreover, if the Russian navigators had ascertained the existence of an island of such an extent, they could only have done so by coasting round it. In other words, the last secrets of the Arctic would have been disclosed to them.

The discovery is a great one, all the same. An island whose coast-line, on one side only, stretches more than two hundred miles must necessarily be of very considerable extent. It is probably as large as Scotland, and it may be much larger. Further, it may prove to be only one island of a new Arctic archipelago, linking North America with Siberia. This is a fascinating surmise. On the opposite side of the Arctic Ocean from Cape Chelyuskin are the Parry Islands, and these islands, or their neighbourhood, are the objective of the Canadian Arctic Expedition which, under the leadership of Mr Stefánsson, is at this moment working northward from the coast of Arctic Canada. Mr Stefánsson's name came prominently before the public a year ago in connection with the tribe of 'white Eskimos' whom he found living in Victoria Land and along the shores of Coronation Gulf in the course of his expedition of 1908-12. Since then, and in consequence of the ability he has displayed as an Arctic explorer, Mr Stefansson has been commissioned by the Canadian Government to conduct a surveygeographical, geological, biological, and ethnological—of the regions he desires to explore, and to plant the British flag in any territory that may be discovered. The ship of the expedition is the Karluk, a barquentine with steam auxiliary, and the route to be followed is from the whalingstation at Herschel Island, near the mouth of the Mackenzie River, toward Banks Land and Prince Patrick Land, and as far beyond as the destinies of the explorers may lead them. The Karluk will return periodically to civilisation, but the exploring party will be lost to sight for four years. It is of much interest to Scottish readers to know that Mr Stefansson has on his staff Dr Alister Forbes-Mackay of Edinburgh, surgeon and naturalist to the expedition; while Glasgow is represented by Mr William Laird M'Kinlay and Mr James Murray, both engaged

in scientific work. The first of these three, like his leader, has already had much experience in Polar research, having been a member of Shackleton's Antarctic expedition.

It cannot be expected that an undertaking of such a nature can be carried out without a single check, and the latest despatches have shown that the Karluk, with most of the 'northern party' of the expedition on board, broke adrift from her winter quarters on the 23rd of September, while Mr Stefansson and other members of that party were on shore. There is good reason for believing that this separation will only prove temporary. In the meantime the leader is continuing his survey of the Mackenzie Delta, and he will probably have carried out his intention of journeying by sledge over the sea ice to Prince Patrick Land in February or March. The work laid out for the 'southern party' of the expedition appears to be confined to the littoral of the continent

If, as every one hopes, the Canadian Arctic Expedition returns in good condition after its long exile, what tale will it have to tell? The story, at the very worst, will be full of interest. But there are possibilities that stir the imagination. Mr Stefánsson has already found people living in a region which was previously believed to be uninhabited; he may have a similar experience in the near future. There can be no doubt that, underlying the practical reasons which have induced the Canadian Government to equip this expedition, there are other motives that sway the explorers: the love of adventure, the hope of drawing aside the veil that has so long hidden the Unknown North. There are rumours of land lying beyond Prince Patrick Land; who can say but that it is inhabited? That human beings can exist at the Poles has been demonstrated within the last two or three years. Permanent occupation is therefore quite possible wherever there is land and game, and the northern limits of these have never yet been ascertained.

The bearing of these considerations upon the recent Russian discovery is manifest. It may be confidently assumed that Russian scientists will stimulate their Government to equip an expedition for the exploration of Nicholas II. Land, as their new island is called. It will not be a difficult matter, if the Russian Treasury provides a reasonably generous grant, to establish a base on the southern shores of the new land with which an exploring party can keep itself in touch. Simultaneously, then, there will be a Russian party moving northward from Nicholas II. Land and a Canadian party moving northward from Prince Patrick Land, each in the expectation of discovering land hitherto unknown. It is perhaps too much to anticipate that, within the next four years, this synchronous movement will result in a dramatic meeting between Canada and Russia in the neighbourhood of the North Pole. Something of the kind, however, must happen sooner

or later if an archipelago actually exists in the area indicated. One thing certain is that the Canadian Arctic Expedition 'means business,' and that it has every prospect of succeeding. Mr Stefansson has long ago learned that the safest way of encountering the difficulties of Arctic life is to adopt the methods of the natives. While availing himself of all the resources of civilisation, he relies for his food upon the products of land and sea, musk-oxen, caribou, hares, seals, birds, and fish; rejecting the somewhat dangerous tinned meats that other explorers have trusted to. And he quite realises that no wooden house built above ground is so warm and safe, in the severity of an Arctic winter, as the subterranean dwelling, or even the snow igloo, of the Eskimo. If careful preparation and wise forethought can ensure success, this expedition will succeed.

So far no information has reached us with regard to the existence of game in Nicholas II. Land. The New Siberia Islands, and, farther to the east, Wrangel Island, are the haunts of reindeer. According to one account, the musk-ox is also found in Wrangel Island. Nordenskiöld, who disputes the statement as to the musk-oxen, quotes a very interesting tradition obtained by Wrangel from the Siberian tribe of the Chukches about ninety years ago. Wrangel's informant was an old man, and his story was that during the lifetime of his grandfather a boat containing seven Chukches, one of them a woman, had ventured too far out to sea. 'After they had long been driven hither and thither by the wind, they stranded on a country unknown to them, whose inhabitants struck the Chukches themselves as coarse and brutish. The shipwrecked men were all murdered. Only the woman was saved, was very well treated, and taken round the whole country, and shown to the natives as something rare and remarkable. So she came at last to the Kargauts, a race living on the American coast at Behring's Straits, whence she found means to escape to her own tribe. woman told her countrymen much about her travels and adventures; among other things, she said that she had been in a great land which lay north of Kolyutschin Island, stretched far to the west [sic], and was probably connected with America. This land was inhabited by several races of men; those living in the west resembled the Chukches in every respect, but those living in the east were so wild and brutish that they scarcely deserved to be called men.

Taking this tradition in connection with a parallel statement of a much more historical nature, Nordenskiöld is inclined to accept the story of the eighteenth-century woman as substantially true. He identifies the 'great land' north of Kolyutschin with Wrangel Island. The fact that Wrangel Island seems to be quite uninhabited at the present day is no proof that it did not contain 'several races of men' in the

But the story certainly eighteenth century. seems to indicate a territory of much greater extent than Wrangel Island. It can hardly be assumed to be the newly discovered Nicholas II. Land, for that lies a long way to the north-west. But geographers believe that there is land due north of Wrangel Island, the extent of which is unknown. If that land stretches eastwards toward Point Barrow, it might quite well have been visited by the Chukch woman of the story. Nordenskiöld, indeed, while accepting Wrangel Island as the scene of her experiences, is prepared to believe that its dimensions are very much greater than those at present allowed to it by cartographers. 'Now we know that the land spoken of by tradition actually exists,' he observes, 'and therefore there is much that even tells in favour of its extending as far as to the archipelago on the north coast of America. With this fresh light thrown upon it, the old Chukch woman's story ought to furnish a valuable hint for future exploratory voyages in the sea north of Behring's Straits.

The present situation may be summed up thus: It will be seen that there is land stretching

northward from the south shore of Nicholas II. Land. Land is also known or believed to exist to the north of Wrangel Island and of Prince Patrick Land. An examination of the Arctic map will show that these circumstances all point to the existence of a hitherto unknown archipelago in North Polar regions, upon which exploring expeditions from Siberia, Alaska, and Canada would all converge. Such expeditions could easily be equipped by the Russian, United States, and Canadian or British Governments. Or a single multi-millionaire could spare the necessary funds without any sense of loss. Practical people often raise the objection that scientific expeditions yield no practical result. It may be answered that the great whaling industry of the Antarctic seas is directly the outcome of exploration, and that the mineral wealth of Spitzbergen is at length being realised. But, over and above these somewhat base considerations, exploration justifies itself by the additions which it invariably makes to human knowledge, and by the quickening effect it produces upon the intellectual life of

THE WRONG KEY.

CHAPTER IL

'I LEANED back in my chair and stared at the cipher. So some one was going to "take Stewart away," was he? I doubted it! Then I remembered that I had been "taken away" several times, without my having known it at the moment. There had been false alarms of various kinds—sometimes a report that a patrol of Boer scouts had been seen in the district; sometimes an account of a farm having been raided by a party of invaders from over the border; once an alarm that the Kaffirs on the location were getting out of hand. And in each case there had been evidence to back up the report when I arrived at the spot—a handful of Mauser cartridges spilt on the road, as if they had fallen from packed bandoliers; a stripped farmhouse and crying women; or a gang of excited armed Kaffirs. It had all been prearranged.

'The meaning of this message was plain enough: the agent in Vrijstad, whoever he was —and the Trades Directory showed that there was a storekeeper called P. J. Bosman in that town—had arranged that a consignment of arms should reach Keurstad at about eleven o'clock that evening, and wanted me taken out of the way while it was being unloaded in Van Zyl's big wagon-shed, where he kept his wool-bales. Bartman had been engaged in translating the cipher message on the typewriter when he was supposed to be sending an answer to the firm in Vrijstad, and had by now told the other people who were in the business that they were to be

at Van Zyl's at the proper hour, when I should be away in the district on a wild-goose chase of their devising.

'A nice state of affairs it was, and the more I thought of it the angrier I became; for it was as plain as daylight now that my own four policemen must have been in the game all along, or the rifles could never get through. Wagons that I searched were always innocent enough, of course; the other kind only came in when the tip was given by my men that I was away. As it all unfolded itself I began to have a sick sort of feeling that there wasn't any one that I could trust besides the magistrate and—and whom else? I wondered. Good heavens! there wasn't a soul that I didn't begin to suspect now, since Bartman and Van Zyl and my own police had shown themselves to be such skunks. I was in a pretty ugly temper, I can tell you, by the time I'd made up my mind what to do. There's nothing gets a man's back up like the feeling that he's being played with.

'I looked at the end of the message again.

'Neem Stewart weg!"

"Oh no, brother!" I thought, "not this time;" and I swore that the man, or the men, even if there were a dozen of them, that tried to "take me away" would take more than they exactly wanted. I went into my own office and took out of my desk a long Mauser pistol that I kept for my own use. It was a lovely thing, any amount better than the regulation revolver

that I kept hanging from a peg in the other office; but of course I wasn't supposed to have it. As I was stowing it away in my coat there came a sound of feet running along the road outside, and then the challenge of the town guard sentry who was always posted at the court-house after nine o'clock. Then I heard Bartman's voice explaining to the sentry that he wanted to see me urgently. "Oh," I thought, "the abduction—or is it to be a seduction—again." The door of the other office was thrown open, and Bartman shouted:

"Mr Stewart! Mr Stewart! where are you? You're wanted."

"Here I am!" I called back, going into the room quietly. "What is it this time?"

'He was standing in the corner of the room near the door, next to the table where I had been using the typewriter; and on a peg just behind him hung my revolver in its holster.

"By Jove, sir," he began breathlessly, "I'm glad I managed to find you before you'd left the office! There's been most awful trouble out at Klassen's farm. Three of the—of the—I mean to say, three"——

'He stuck fast in the middle of the sentence, and then I saw that he wasn't looking at me, but at the paper lying on the table—my copy of his cipher. The poor devil looked as if he were watching a snake about to strike him; his mouth opened, and every bit of colour left his face. At last he managed to take his eyes off it, and looked across at me. I suppose I must have looked pretty grim at that moment, though I was smiling to myself, smiling with pure rage, for it seemed to be too much for his nerves. He suddenly let out a yelp like a strangled puppy, and made a grab for the revolver behind him.

"Hands up!" he called out in a very shaky voice that wouldn't have scared a rabbit. "If you don't let me leave this room, and swear not to say anything about that letter, I'll shoot you on the spot!"

"Shoot away, sonny!" I jeered at him, though I was feeling mighty unhappy, all the same, when I saw how his fingers were twitching. "Why, with a hand like that you couldn't hit an elephant!"

"Î'll do it, Mr Stewart! I swear I will!" he screamed, with the barrel of my revolver making circles in the air.

"Do it, then, you rat!" I cried, and ran at him. He yelled with fright and dropped the gun, but it was too late to prevent my fist smashing into his jaw. Down he went with a crash, his hat going one way and my pistol another. It was a cheap enough victory; but, all the same, I picked up my revolver before I looked to see whether he was hurt or not.

'He was stunned right enough, but there wasn't any time to waste, so I called the sentry outside, and told him to see that Bartman didn't get away until I came back. The sentry

looked startled, but I didn't explain to him; he probably didn't need much explanation. I put a handful of cartridges into my pocket, and went off down the street in the direction of Van Zyl's wagon-shed, which was about a mile away. I was in a murderous sort of temper by this time, but I hated the idea of having a row with Van Zyl. He was a decent old chap, and rather a pal of mine; we used to have long yarns together down at his shed of an evening, and so long as we kept off politics he was as jolly an old Dutchman as ever smoked Kat River tobacco and professed to like it.

'It was a pitch-dark night, blowing up for rain, and of course there were no lights in the street, for while martial law was in force all lights had to be put out at nine o'clock, and no one was allowed in the street after ten without a pass from the Resident Magistrate. But it wasn't likely that the sentries at each end of the town would interfere with peaceful gun-runners in the pursuit of their lawful business. Not they; they'd more likely interfere with me if they had the chance.

'It was a little after eleven by the time I reached the shed, as far as I could see without striking a light; and against the sky that showed between the black masses of the trees on each side of the street I could make out the top of a big wool-wagon showing over the line of the mountain beyond, and I heard the creaking of wheels and the clatter and shuffle of many hoofs as the oxen strained to drag the heavy weight across the ditch to the shed, which lay well back from the street. Several men were talking as they stood round the wagon, and not with any air of secrecy either; they evidently felt quite secure, confound them! The whole blessed town must have been in the game, and all of them laughing at the chief and myself. In that moment I hated Keurstad as a schoolmaster must hate his boys sometimes, and I was just in the mood to do anything foolish to make them smart for the way they had been playing with me.

'It wasn't easy to decide what to do. I couldn't very well fight the lot of them, though it wasn't likely that they'd be carrying rifles openly, even in Keurstad; but they might have revolvers. It was just in my mind to rush the door and loose off into the thick of them, when an idea struck me. I'd pay them out in kind, and at the same time do something better for the old Colony than any scrap in the dark could be. I waited there in the darkness under the trees until I was certain that they had all gone into the shed, and then I crept up to the door, with my pistols handy and loose in my pockets.

"Good-evening, kerels!" I called out cheerfully from just outside, with both pistols and one eye across the doorpost. There was a heavy crash of something falling—it sounded suspiciously like an ammunition-box—and then dead

silence. Presently a voice—it sounded like that of Conradie, one of my four policemen—called out from the back of the shed, in an undertone, "Wie's daar?"

"Is that you, Conradie?" I called back. "You're just the man I'm looking for. There's a job on to-night that you'll have to give a hand in—catching a lot of gun-runners!"

"Hemel / It's that — Stewart!" came another voice, with a gasp of dismay; then, "Rush him, kerels / Knock him out!"

"Soetjes, vrienden; soetjes!" I warned them. "Go softly; I've got a revolver in my hand, and it might go off if you fluster me. I'm nervous in the dark."

"That's all right, kerels; it's not loaded!" shouted Conradie. "Bartman took all the

powder out of the cartridges."

"Sorry to disappoint you, friends," I returned; "but I also have a Mauser pistol in the other hand." There was a muttering and shuffling in the darkness of the back of the shed; evidently they weren't quite happy among themselves. And then I went on: "But why all this talk of pistols and knocking out? Isn't it a bit foolish, seeing that I'm here to give you a hand?"

"What d'you mean?" asked several voices excitedly. "Are you in the game too, after

all?"

"I don't know what 'game' you're all talking about," I said. "But if you want to know, I came down to tell you that this consignment is really to be stored up at the court-house, and not down here; it's more convenient to have the rifles in the centre of the town, where they can't be got at by any possible rebels."

"What are you driving at, curse you?" asked a deep voice in English that I recognised as Van Zyl's, and pretty savage it sounded in the dark-

ness of the shed.

"That you, Mr Van Zyl?" I asked. "Ah, a sensible man at last. Well, Mr Van Zyl, I want you and your friends just to take all this stuff up to the court-house, and help me to store it there under lock and key, with all the other guns that were handed in. I'm sure you won't mind that?"

"And if we won't? If we kill you first? You mustn't think that because"——

"I think not, Mr Van Zyl; I think not! I said it would be more convenient for you to oblige me in this little matter; and when I tell you that I've reloaded my revolver while we've been chatting, and that I've got you all nicely covered"—I was standing just inside the shed by now, where I could see them standing round a small candle on the ground, and they couldn't see me—"you'll understand that it really will be more convenient—for you and your friends!"

'Van Zyl wasn't a fool, and he saw that the game was up. He thought for a bit, sucking in his breath through his teeth; then he laughed in a sick sort of way, and threw out his hands.

"All right, Stewart," he says; "you've got us fairly this time.—Shove those boxes back on the wagon, boys, and pray for better luck next time."

'It was amusing to watch that very disgusted crowd piling ammunition-boxes and heavy riflecases on the wagon. I made them light a number of lanterns, partly that I might stand in the shadow and see that none of them tried to make a bolt for it, but quite as much for the sake of watching their faces as they worked. They looked as if they were attending their own funerals, and cheap and nasty funerals at that, such as a Dutchman hates. It was meat and drink to me after all the worry I'd had. Shows what kids some of us are after all!

'When it was all done we started off the oxen, and the whole procession rolled solemnly up the street, with me behind as chief mourner, though I wasn't over-mournful; it was the others in the lamplight that fitted the part better. As we passed along the street I could hear shutters being softly opened, and smothered exclamations; and once I thought I heard a woman sobbing. There wasn't much doubt about whom the town sided with.

'We drew up at the court-house—the sentry had disappeared, for some reason; afraid to meet his pals, I suppose—and I turned to them.

"Look here," I said, "it's no use looking so glum about this job; you've got to do a bit of forced labour for once, and I'm not going to pay you for it; but it's all in a good cause, so for any sake try to look a bit cheerful about it!"

"It's all very well for you," broke in the heavy voice of old Van Zyl; "but you needn't expect us to laugh at your silly jokes. You take my Mausers and my cartridges, and you get me sent to prison—and more, possibly—and then you try to be funny like a d—— Hottentot!"

"Who's talking about prisons?" I asked, for the old boy was really badly upset; and no wonder. "Not I. There's nothing criminal in helping the Government to collect a lot of arms that may have been meant for a crowd of rebels, as any other loyal Colonist would have done! Why, man, we're much obliged to you for doing it! I've got nothing to do with your reasons for taking them to the wool-shed first; but there's no harm done, anyway. So I'll just take your names in case the magistrate wants to thank you personally, and then we'll get to work."

'The idea took some time to soak into their minds, and they wouldn't believe at first that there wasn't going to be a court-martial; but they gave their names and addresses—it wasn't really necessary, for I knew every one of them, by sight at least—and then we unloaded the wagon and carried the rifles (two hundred of them) and the ammunition-boxes into a little cell at the back of the lock-up, where all the other firearms were stored. After that we ad-

journed to the court-room for coffee, supplied by the jailer's wife.

'As we sat on the benches facing the magistrate's seat, drinking our coffee, I noticed that my guests seemed much interested in the fittings of the room; they stared about them like children in church, though most of them had been there before, attending municipal council meetings; they were influential men, for the most part. Then I heard a grunt from old Van Zyl, who was sitting next to me.

"Dat's der dock, niet waar?" says he, jerking his head towards the other end of the

"Ay, that's it, Mr Van Zyl!"

'He considered it for a while, nodding his head thoughtfully. "Zoo, ja!" he said slowly. "Zoo! It looks nicer from this part of the room, Mr Stewart—much nicer! Well, there won't be any trouble in Keurstad, I think; not until the Burghers from the Transvaal come and clear you out of it."

The inspector knocked the ashes out of his pipe. 'They did try to take the town a few months later,' he added; 'but Van Zyl and his crowd wouldn't let them.'

THE END.

THE DISTRIBUTION OF FISH AND GAME.

By H. MORTIMER BATTEN.

IT is a curious fact that many North American rivers—generally those which flow through comparatively low-lying muskeg forests—contain long stretches of deep, clear water which appear to be almost entirely destitute of life. Not only are there no fish in these stretches, but one is struck by the complete lack of aquatic insect life—water-beetles, snails, spiders, and such like.

Take as a typical example the Mattagami River, Porcupine, north Ontario. Among the headwaters of this river fish are plentiful, but lower down one comes upon vast stretches from which, as the Indians will tell you, fish have never been taken.

Still more curious is the fact that very often the creeks which join these desert stretches harbour pike and small fry in large numbers, while other desert waters I have known actually join lakes which literally swarm with white fish and suckers. How is it that these stretches remain uninhabited, while in direct communication with them are waters teeming with life of all kinds?

Very often it can easily be explained. On the approach of civilisation the adjacent waters are apt to become polluted, no one knows just how, and for many years no fish are taken from the poisoned stretch. Again, the portable sawmill is responsible for the destruction of many thousands of fish, but as soon as the mill is gone the fish swim back into the depleted waters.

The damming of a river, causing it to overflow the surrounding forest, and thus exposing large areas of decaying matter, will cause a general migration on the part of the fish to the headwaters; but the desert stretches of which I write have always been desert—that is, so far back as the Red Man's memory can carry him, which is usually a very long way. They were recognised as desert stretches by the Indians years ago, and in passing from one hunting or fishing ground to

another the Red Man avoided these stretches when it was necessary for him to procure food on the way.

Were disease responsible for this, the fish would certainly find their way back sooner or later. In British Columbia my partner and I, late one evening, came upon a small lake, the surface of which was literally white with dead They lay in ridges all along the east bank -suckers mainly—while others were drifting belly upward on the surface, and came to life immediately we touched them. The bears of the vicinity must have held a carnival. An outbreak of this sort, however, would not entirely deplete the waters, and would attack only one or two species; for instance, there were no trout among the infected fish alluded to, though trout were probably the most abundant fish in the lake.

Now is it not possible that some poisoning in the water is the cause of these desert stretches? For instance, a small mineral spring joining the main river at a certain point may for some miles lower down so pollute the water as to render it impossible as a habitation for the more abundant forms of aquatic life; while, in due course, the water becomes purified by a natural process of filtration, and occupation begins again.

The poisoning, whether mineral or vegetable, may be so slight as to be almost undetectable by analysis, the water being so faintly tainted that, while not actually causing death to such creatures as may wander into it, it is sufficiently strong to prevent them from settling permanently. This, indeed, seems the only possible solution, and certainly would open up a new line of inquiry should it prove to be the correct one.

Another curious feature is that the forests surrounding these dead waters are often equally remarkable for their lack of life. If squirrels exist there, they usually hold undisputed possession with the woodpeckers. This is more easily explained. A great many wild creatures, though

not actually subsisting on fish, like to live in regions where fish are to be caught should need or desire arise. Again, the entire absence of kingfishers is apt to give the place an atmosphere of abandonment more striking than real.

There is, however, no getting away from the fact that deserted waters and desert forests exist side by side. I remember a young fellow with whom I was acquainted setting out some years ago on a trapping expedition into a country which had always struck me as being strangely lifeless. An old trapper, learning the boy's intentions, shook his head gravely, with the remark, 'The whole country below the headwaters is dead.' The young fellow learnt that this was quite true. 'We never saw scarcely a sign,' he wrote me the following spring, with his usual disregard for correct English. 'There was no fur, and we had to hike out to get moose meat. I never knew such a lifeless place. There weren't even any fish in the river.'

With regard to the uneven distribution of game much might be written. One comes across a little valley literally swarming with life; while the next valley, across the watershed, where the conditions seem exactly similar, may be pulseless as a desert. Trappers know that though a certain locality may yield well one season, it will not necessarily yield well the next. It would seem that periodical migrations take place even among the smallest fur-bearers. Should, for instance, the rabbits migrate, the weasels and lynxes are sure to go with them; while probably the conditions that caused the rabbits to migrate will likewise cause the deer to migrate, and produce a consequent exit of wolves, bears, and wolverines to keep the deer company. When Mr Trapper arrives next season he finds a great change has taken place; while a trapper in an adjacent forest suddenly finds his hunting-ground overrun by wolves.

Forest fires are apt to cause wholesale displacement of wild stock in their vicinity, and for many scores of miles around uneven distribution is bound to follow. It is surprising how far wild creatures migrate, when driven from their chosen hunting-ground, before taking up a fixed abode elsewhere. It is a known fact that a thoroughly frightened caribou will travel a hundred miles a day, and keep it up for days on end, before finally settling; while a wolf liberated in the vicinity of Villa Mare, Quebec, was taken in the Tobique Valley, New Brunswick, the same winter (1902). True, the caribou and the wolf are perhaps the most restless wanderers of all woodland animals. But I know that the lynxes during hard winters gather into packs, and when animals 'pack' it invariably means they are intent on making a long journey; indeed, they are compelled to do so, as they would soon overhunt a limited range, scaring away such of the game as they do not kill.

An exceptionally dry summer or an excep-

tionally severe winter is sure to be succeeded by wholesale migration. Valleys hitherto considered lifeless suddenly become possessed of life, while the happy hunting-grounds of last season no longer yield a harvest. During a dry summer, when thousands of miles of forest are burnt over, the animals make their way into the unburnt stretches between the fire-belts, and there remain for a given period. In due course the timber in the fire-belts begins to recover. It is young and sweet, while that in the area that escaped the fire has become somewhat stale. The deer, moose, and rabbits change their quarters accordingly, and thus the valley where game swarmed a season or two ago is now almost depleted, while the lifeless area has suddenly become possessed of abundant life.

Nature is true throughout to her system of economy. The keepers on the grouse-moors of Great Britain burn the heather at regular intervals to keep it young and sweet for the moor birds; in Canada nature scourges the forest periodicallyor rather nature used to do so, before man took it upon himself, and of course overdid it—and thus not only prevented certain regions from becoming overstocked, but caused a wholesale distribution of such life as escaped. Were it not for the forest fires—with full apologies to the fine ranging staff-many of the northern forests would be uninhabitable both for man and beast, for the insect life, unchecked for countless centuries, would have multiplied to the expulsion of life in any other form. This is no flight of fancy, but actual fact. In virgin forests there is practically nothing to check the multiplication of insect life except the forest fire. mosquitoes are not particular as to diet. Though carnivorous by choice, they can subsist and multiply on vegetable matter. I have seen them swarm in millions out of a bush, every insect as green as the bush itself, and from a vegetable diet proceed at once to make the life of man an unholy terror to him.

Thus the forest fires do good not only by sweetening up old feeding-grounds, but also by entirely wiping out the noxious insect life in the areas they devastate. So far the forest fire is a friend to the wild kindred, though from man's point of view it may be very undesirable. True, there are countries where forest fires are almost unknown, and which have yet survived the insect pest; but there nature has designed some other means—the typhoon, which hurls and shatters all insect life before it; and the tremendous periodical downpour which floods the lowlying lands where insects breed most prolifically, larger insects which prey upon the smaller, and a vast assortment of bird life which preys upon both. The sceptical may observe that the forest fire is the production of man, not of nature; but by no means is this true. A flash of lightning may set the timber burning; while if you traverse the woods long enough you will some

day find two trees or branches blackened and burned by rubbing together. There were forest fires in the days before man learnt the art of kindling a spark for warmth, in the days when he fled in panic from the fire fiend, regarding it | Nature in the fulfilment of her own schemes,

as a thing of life and all incomprehensible. There are forest fires to-day—more than we ever think there are, perhaps—which are brought about by no human agency, but by the hand of

THE MONTH: SCIENCE AND ARTS.

A LOCKED CORK FOR BOTTLES.

AN ingenious method of corking bottles has been invented which is applicable to the bottling of the more expensive liquors. latest device comprises the familiar cork made to standard sizes so as to fit bottles of varying capacity and shape, and provided with a patent metallic double cap. The cork is driven into the bottle in the usual manner; but, instead of a corkscrew, a small key is used for its withdrawal. In the metallic cap is a small slot for insertion of the key, which is slightly depressed. This causes the upper part of the cap to fly upward by means of a spring. This movable disc, which slides upon a substantial though slender shaft, serves as a grip for the fingers, so that a steady and direct pull draws the cork without damaging it. Consequently, when some of the contents of the bottle has been poured out, the cork may be replaced and driven home, the bottle being thus sealed as tightly as it was originally. To all intents and purposes it is the application of the Yale lock used for doors, &c. The cork cannot be drawn without the key, so that tampering with the contents or improper use is impossible, because the key is in the possession of the owner or some responsible person. The drawing of a cork thus becomes an easy operation, and destruction by the corkscrew is prevented. Although the stopper has been designed specially for the liqueur, wine, and spirit trade, it at the same time completely solves the vexed question of securing the safety of bottles containing poisonous liquids, as a bottle stoppered with this new appliance cannot be opened without the key; and as this is in safe keeping, premeditation is required to obtain the contents.

DISADVANTAGE OF THE WHITE ELECTRIC LIGHT.

A correspondent has drawn attention to the statement recently made in the 'Month' that the light emitted by the new nitrogen incandescent electric lamp is analogous to sunlight. This is an error, for it is really whiter and more glaring than sunlight, which is softer and more pleasing to the eye. There are many objections to the whiteness of the electric light whether produced by arc or the nitrogen-tungsten lamp. In the latter the glare is toned down by means of diffusing-globes when it is impossible to place the light from twenty to thirty feet above the ground. In this direction

there is scope for much artistic treatment. The most successful and satisfactory effect is obtained by means of amber shades, which impart a pleasing yellowish tinge to the light, thereby overcoming the ghostly appearance of the naked light. Our correspondent draws attention to a development arising from the utilisation of the electric lamp shedding a white light. If meat is displayed under it a very bad effect is produced on possible customers, as the joints appear anæmic and far from appetising. On the other hand, if the lamp is enclosed within an amber globe, so that the light is rendered somewhat yellowish in tone, the red colour of the meat is preserved. As a matter of fact, to display any perishable viands beneath an arc or nitrogen lamp is a mistake. Even poultry, fish, vegetables, and fruit lack that attractive appearance which tempts the customer during the daytime, this being particularly the case when red and orange colours predominate. In one store known to the writer, the manager of a department was perplexed by the frequent complaint that 'the goods look stale.' Eventu-ally this was found to be due to the brilliant white electric lights in the department. Forthwith the offending lamps were replaced by small incandescent metallic filament lamps, giving a light with a yellow tone, and the complaints immediately ceased. The effect is by no means confined to electric lighting, inasmuch as it is equally noticeable and destructive beneath the glare of high-pressure incandescent gas mantles. It may be mentioned that amber glass shades have been introduced into the House of Commons to neutralise the effect of the white light; while one of the latest lamps for miners emits a concentrated yellow light in preference to a powerful whitish light. The former is not so trying to the eyes, and does not cast such deep and vividly contrasting shadows. It is a well-known fact that the leading ophthalmic surgeons condemn both the high-powered electric and gas lights which to-day are so much the vogue as being injurious to the eyesight. Certainly there is no light so restful as that produced by the oil lamp, which is yellowish in colour; even acetylene is preferable, since its light is the nearest approach to that of the sun.

MAKING RADIUM WATER AT HOME.

Quite a lucrative and promising business has been developed by the supply of water from the radium springs in bottle, similar to the waters of Carlsbad, Vichy, and other therapeutic spas. The demand for radio-active water arises from its curative properties in the treatment of such maladies as rheumatism and gout. Now a method has been discovered of making this radio-active water in the home. The process is extremely simple, the effect being produced by means of a radio-activator, as it is called. The apparatus comprises a small glass cylinder provided with perforated bottom and top metallic caps, the metal being non-rusting and unaffected by the radio-action set up. This cylinder, which is inserted in an ordinary tumbler, is charged with certain natural radium ores. The tumbler is partly filled with water and the radio-activator immersed. As the water is able to come into contact with the radium ores owing to the perforations in the top and bottom caps, it becomes radio-active. Twelve hours' immersion is the average period required to obtain the best results. With this apparatus a high radio-activity is not attempted, the inventors maintaining that in the present state of knowledge concerning radium it is safer to imitate the natural springs as closely as possible. At the moment there is no experience available concerning the various effects arising from the use of highly radio-active water for any length of time; while it is not impossible that by using radium salts instead of the natural ores, some of the most curative properties, the sources of which remain undiscovered, are excluded. The water produced by this small radioactivator may not be more radio-active than that obtained from the springs; but experience has shown already, in connection with the treatment of rheumatism, that the effect produced is so strong as to compel a modification of its use, or even suspension for a time. From such results it is only fair to surmise that the use of a radioactive water of some thirty times the intensity of that produced by this little home device is attended with a certain element of risk. is one very powerful reason why radio-active water should be made when and as required. That bottled at the springs loses its radio-active properties very rapidly. In less than three weeks about 97 per cent. of the original radio-activity will have disappeared, as the radium gas is transformed into another substance which possesses no curative qualities. Consequently, if a course of treatment for rheumatism—it is generally conceded that radio-active water is the most successful treatment for this malady-is contemplated, it is essential that the water should maintain a uniform radio-activity to be beneficial. It may be mentioned that a curious effect is sometimes observed when radio-active water is taken as a cure; the complaint appears to get worse for a short time; then a general improvement sets The quantity of radio-active water produced by this home apparatus at one time is sufficient for one dose, and then it is necessary only to refill the glass and reinsert the radio-activator. This suffices for two glasses per day, morning and night respectively, although it may be taken more frequently if desired.

A HANDY GOLF-BALL LIFTER.

A golf-ball lifter, the object of which is to save the strain of bending the body to pick the ball out of the hole, has been introduced. It comprises a circular spring like those used in the pocket-clips for fountain pens, pencils, and what not, and is fitted with two vertically projecting loops. The lifter, made of stout steel wire, is slipped over the end of the putter; when not in use the spring is pushed down slightly, so that the loops lie close against the handle, and are not in the way when the player is putting. Before the ball is lifted out of the hole the spring is drawn to the end of the handle to allow the spring loops to project, then the putter is reversed and the handle-end is inserted into the hole, when the loops slip around the ball and grip it tightly.

A UNIVERSAL ACETYLENE LAMP.

The utilisation of acetylene for lighting purposes has undergone great advances during the past few months, particularly in rural houselighting. But hitherto the small country householder has been somewhat neglected in this matter. The central generator, even of the smallest and most inexpensive type, has been beyond limited means; but all disadvantages are now overcome by the Dargue self-contained lamp, which may be described as of the universal pattern. It is constructed solidly of polished brass, and works automatically, the water-feed to the carbide being drop by drop, and the regulation thereof effected by the gas. The lamp has two essential parts—the upper, or water-vessel, and the lower container, in which the calcium carbide is placed. When these are filled and the valve is turned, gas is generated continuously, yielding a uniform light, without any waste of gas or varying pressure, until the carbide is exhausted or the valve is turned off. It gives off neither smoke nor smell, and is perfectly safe to handle, as there is no danger of explosion. The lamp is easily dismantled, so that it can be thoroughly cleaned with facility; it is made in one standard size, is cheap, and can be utilised for many purposes. An inexpensive holder, an extension tube, a gallery, and a silk shade render it an artistic embellishment to the dining-table. By removing the tube it can be inserted in the holder of a floor lamp to light the drawing-room, dropped into a bracket on the wall to illumine the hall, or carried about with perfect safety and without interfering with its mechanism in any way. It is the only lamp of its kind adapted to such various purposes which has automatic control. Hitherto the flow of water had to be regulated by hand; but, once lighted, this lamp requires no further attention until the carbide is exhausted. When

more gas is needed the decreased pressure in the container permits the water to drip faster; but when the gas-pressure rises above the required level the water is shut off automatically. With the valve closed the generation of gas is stopped immediately, and the unused carbide is held in perfect condition until the lamp is again required. The cost of the carbide, bought in twenty-eight-pound quantities, is twopence per pound, and in drums of one hundredweight fourteen shillings and sixpence, or about threehalfpence per pound. With carbide at twopence per pound, the lamp will run a fifty-candlepower burner for five hours on one one-pound charge of carbide; at the lower price, the cost of maintaining the lamp is reduced proportionately, and this result compares favourably with But it must be borne in mind that any slightly enhanced cost of acetylene, as compared with oil, is more than counterbalanced by the extra lighting efficiency obtained; while the advantages of increased cleanliness and safety must not be overlooked. The Dargue automatic acetylene lamp is essentially suited to a small country house or cottage. Nowadays the methods of storing calcium carbide, even in the home, make it as safe and as easy to handle as oil.

CLEANING AND POLISHING FLOORS BY ELECTRICITY.

The success of the vacuum-sweeper has led to the evolution of a convenient, compact machine for the cleaning and polishing of extensive floor surfaces of wood, tiles, mosaic, parquet, plain floor-boards, or linoleum. The machine comprises a flat carriage measuring a few inches in length and width, mounted on wheels fitted with ballbearings to facilitate easy movement and noiseless-The lower part of the carriage is provided with detachable brushes, which may be changed instantly when necessary. On the upper surface is mounted a small cylindrical container and the electric motor driven from an electric-light holder or wall-plug. The machine is of stout construction, and can be used for scrubbing on wet surfaces or where the raising of dust should be avoided. The more expensive type is particularly adapted to cleaning and polishing parquet or wood floors. The brushes work with the grain of the wood, thereby removing scratches, blemishes, or stains without recourse to sandpaper, pumice, &c. The machine is provided with a handle like that of a lawn-mower to assist steering and manipulation, and by its aid the corners can be easily penetrated. The weight of the larger machine, in running order, is eighty pounds; while the smaller machine, the brushes of which work with a rotary motion, weighs ten pounds less. By means of this apparatus an even, steady polishing pressure is always maintained, and the resultant effect is far superior to that obtained by The largest floor surfaces can be hand-work. cleaned and polished within one-fifth of the time spent in manual effort, and the manipulation of the machine is simple and easy. Further, the cost of operation is low, averaging about one halfpenny per hour for electric current.

SUPERSEDING THE CARPET BROOM.

A few months ago the vacuum carpet-sweeper known as the 'sweeper-vac' was referred to in these pages. Recently some noteworthy improvements have been effected which cannot fail to be appreciated by the lady of the house. One is the incorporation of auto-roller bearings for the carrying-wheels, which not only reduces the physical effort required to manipulate the machine by more than one-half, but ensures a longer life to the mechanism and immunity from repairs. A silencer has also been introduced, so that the implement is now noiseless and easy to handle. In appearance, too, the machine has undergone distinct improvement, nickel instead of japanned fittings being used. The efficiency of this vacuum carpet-sweeper is due to its scientific design, in which there are only two bellows instead of three, these working alter-Theoretically and practically this is the most effective mechanism, because the power for operating the bellows is developed merely by the large traction-wheel running over the carpet; and the fact has to be borne in mind that the suction apparatus had to be contained within a space not much greater than that required for the ordinary brush-sweeper, while weight had to be severely kept down. The two-bellows system. carried out upon correct lines, secures absolute simplicity without any sacrifice of efficiency, the essential consideration being the production of a continuous air-current of constant power by alternating action. By means of the two bellows working on this principle perfect balancing may be obtained, since one is always expanding while the other is contracting, thus ensuring a steady, rhythmic motion. The success of the sweeper-vac has revolutionised the whole process of carpet and floor sweeping.

TRANSVERSE TRAVELLING HOTHOUSES.

A striking development of the commercial culture of hothouse produce is foreshadowed by the invention of a new system of travelling hothouses. These structures are made on a principle which enables them to be moved quickly and easily over any number of plots without undue strain. For the sake of example we will take the case of a double-span hothouse covering one hundred feet by forty feet, arranged to travel over about an acre of land. This plot is divided by cement pathways into eleven sections, any one of which can be completely covered by the house when required. Lengthways the land is bounded and divided by seven cement pathways only a few inches above the ground-level. The two outer pathways carry a three-inch steel rail, while the other five are merely faced with Portland cement. On each pathway run one drivingwheel, in the centre of the structure, and four bearing or conveying wheels mounted between trussed girders made of pitch pine. At each end of the house there are two horizontal wheels which travel against the side of the steel rail to keep the structure square. Motion is imparted to the driving-wheels by means of a shaft which runs the length of the house, actuated by spur and pinion gearing situated outside at one end. The difficulty with a long shaft of this nature is to overcome torque, but this has been successfully accomplished by a simple arrangement of setscrews. So well does this answer that the two ends of the house start into motion at practically the same moment—a very important feature of the invention. When it is required to move the house in either direction the fly-wheel of the gearing is turned, the hinged sides being first raised to clear the standing crops. The house glides smoothly sideways, one man easily moving it on to the next plot in twenty minutes. boiler, hot-water pipes, cold-water service, ventilating gear, and plank pathways travel with the house. The cultural possibilities of such hothouses are boundless. The plots are cropped in such a way as to afford a rotation over which the house can travel in the course of a year. Many crops require heat merely in their early stages, others only when near ripening; and in such cases the use of a fixed glasshouse is wasteful. For the forcing of a rapid succession of crops the advantage of the new system is obvious.

THE POSTAL SAVINGS BANK IN THE UNITED STATES.

Some two and a half years ago the United States Government established postal savings banks. At the end of the first six months, according to a report which has been issued lately, there were eleven thousand nine hundred and eighteen depositors, with six hundred and seventyseven thousand one hundred and forty-five dollars On 13th June 1913 there were to their credit. three hundred and thirty-one thousand one hundred and six depositors, with thirty-three million eight hundred and thirteen thousand eight hundred and seventy dollars at their credit; and in all probability, in the course of a few years, the deposits in these banks will amount to an enormous sum. The system adopted by the United States Government differs from that of the postoffice savings banks of the United Kingdom. In the latter, when a person makes his first deposit, he is given a pass-book, in which are entered all his deposits, all his withdrawals, and the accrued interest. In other words, this book contains a complete record of all his transactions with the bank. In the United States, when a person makes his first deposit, a certificate for the amount is given to him, and a duplicate of this certificate is signed by the depositor, and retained by the postal bank; and each time a deposit is made there is the same procedure. The certificates are of fixed denominations—one, two, five, ten, twenty, fifty, and one hundred dollars respectively. An account cannot be opened for less than one dollar, nor will fractions of a dollar be accepted. Sums of less than one dollar may be saved for deposit by the purchase of ten-cent postal cards and ten-cent postal savingsstamps. Nine ten-cent savings-stamps affixed to a ten-cent postal savings card will be accepted as a deposit for one dollar. A depositor may at any time withdraw the whole or part of his deposits by surrendering savings certificates for the amount desired. Interest at the rate of 2 per cent. per annum is computed on each certificate separately, and is payable annually; but no interest will be paid on money which remains on deposit for only a fraction of a year. The result of all this is that, according to the system prevailing in the United Kingdom, the pass-book shows the amount due to the depositor, whereas in the United States the amount due to the depositor is represented by the certificates in his possession. If one is lost and no entry has been made by the depositor in the blank ledgerrecord furnished to him by the postal bank, the loss of this certificate and of the money it represents may never be discovered by him unless, for some reason or other, his certificates are compared with the account kept by the bank. would, therefore, appear that however well this system may be adapted to business people, the old-fashioned pass-book is better suited to the average depositor, who, as a rule, has not received a business training.

To Correspondents who wish fuller information regarding new inventions mentioned here, addresses will be furnished, when possible, provided a stamped and addressed envelope or post-card be sent to the Editor, 339 High Street, Edinburgh.

THE PIONEERS.

ALONG life's stream full many sail
Who have no thought but of their ease;
They float with wind and tide, their trail
A foam-line scattered by the breeze.

But there are some who would explore And know the beauties of the land, Who run their little crafts ashore, And struggle forward through the sand.

With fearless heart and eager eye
They strive a wider world to gain.
What if perhaps their names may die?
The imprints of their feet remain.
MARGARET BAKER.

. TO CONTRIBUTORS.

1st. All communications should be addressed 'To the Editor, 339 High Street, Edinburgh.'

2nd. For its return in case of ineligibility, postage-stamps should accompany every manuscript.

3rd. To secure their safe return if ineligible, ALL MANU-SCRIFTS, whether accompanied by a letter of advice or otherwise, should have the writer's Name and Address written upon them in FULL.

4th. Poetical contributions should invariably be accompanied by a stamped and directed envelope.

TROOPER 13,846.

By J. MORTON LEWIS, Author of Brunswick of the R.E., &c.

DEVEREUX stood beside the table. He stood alone amidst the fragments of the feastempty wine-bottles, plates, and dishes, exactly as his friends had left them. He seized a bottle and snapped the wires, and the wine bubbled over the glass and splashed on to the cloth. He raised the glass, and his lips moved over a silent Then he tossed off the wine and set down the glass.

Facing him stood a mirror. He smiled at his own reflection. Men called him handsome; now there was a wild look in his eyes, and his black curly hair was untidy. As he saw himself there came back to him the memory of the past six months of his life—the wreck he had made of it. His hand travelled to his pocket, and he took out a revolver. He looked at it curiously; it spoke much for the man that there was no fear, or even doubt, of himself. He had danced the dance that can only have one ending, and now the time had come to pay.

The weapon was raised and pointed to his head, when the curtain at the far end of the room was flung apart, and a figure rushed towards him.

'Stop!' cried the girl.

Devereux put down the weapon. Madge! Well, I'm hanged!'

The girl he addressed was young. She was at the awkward age, with the consciousness of a girl who has just put up her hair. She looked at him reprovingly. 'Dick, I didn't think you were a coward.

'Neither did L Devereux smiled cynically.

What are you doing here, child?'

Madge Lawrence was old for her age; for, many months before, Devereux himself had described her as a little witch. 'I came,' she said, 'because I expected something of this sort.' She laid a hand on his shoulder. 'Dick, no woman is worth what you have done.

'I loved your sister,' said Devereux.

'I know.' A shade of wistfulness crossed the girl's face. She was young-very young-but still she had her dreams of love. Later she was to learn of its pangs. 'But Grace never loved you; and because she broke off the engagement you tried to forget, you threw away all your | surprised.

money, and then you tried to use this! What good has it all done you?'

Devereux slipped his arm round her. 'It has taught me one thing: that you have hidden depths I never dreamed of. How did you get here ?

'I came by taxi. Every one is out. I have been behind that curtain for three hours.

'The deuce you have!' Devereux said. 'Well, you will have to go home now. I'm afraid Mr and Mrs Lawrence wouldn't approve of to-night.'

Madge shrugged her shoulders. A hidden fire smouldered in her eyes—forecast of the woman that was to be. 'Do you approve of it?'

'I think you are a little brick.'

'Then promise me you won't use this.' pointed to the revolver lying on the table.

Devereux laughed bitterly. 'Kiddie, I've been a fool.' He emptied the contents of his pockets on the table-nineteen shillings and tenpence halfpenny in silver and copper. He placed it all beside the revolver. 'There are my earthly possessions. I can't earn a penny; I've never been taught how to. Do you wonder I chose what I did?

Madge picked up the weapon fearlessly. 'Then

I shall take this from you.

Devereux's hand closed over hers. 'Stop!' he said. 'It's no toy for a child like you.'

'Not unless you promise me' She looked at him fixedly, and there was that in her pure young eyes which made him ashamed. 'Dick, life lies before you. Fight your way. woman is worthy of what you would have given'

'I am beginning to wonder if one isn't.'

'Not Grace?'

'No,' said Devereux gravely; 'not Grace.'
'You'll promise me, Dick! You may have only nineteen shillings and tenpence halfpenny now, but some day '-

Devereux leaped to his feet; a light shone in his eyes—the light of battle; it was as if the scales had suddenly fallen from before his eyes. 'No,' he said, 'I've more than that-far more; something you've given me.'

'Something I've given you!' The girl looked

MAY 2, 1914.

No. 179.—Vol. IV.

[All Rights Reserved.]

'Yes'-Devereux caught her hands in his and

looked into her face—'Hope!'
The girl smiled. She felt glad, more than glad. A strange, new emotion swept through her. 'I'm so glad, then!'

'Yes,' said Devereux, 'I'll promise. I'll fight my way, more folly, my child. although how, Heaven alone knows. Now I'm going to see you home.'

He led her down the stairs, and through the general supper-room of the restaurant, where the waiters bowed obsequiously; for Richard Devereux was a good customer, and they were not to know he would not cross the threshold again. Outside he hailed a taxi.

'Dick,' expostulated the girl, 'you can't

afford it!'

'Nonsense!' responded Devereux gaily. 'I'm not poor. I'm rich-a millionaire-for have I not hope!'

On the journey he laughed and chatted as if without a care, until the girl, in her ignorance, wondered. In after years she remembered, and knew what had caused his gaiety that night.

Only once was he serious—when they were reaching the end of their drive. 'Madge,' he said, 'when the time comes for you to choose, choose carefully. You are too good a little soul to throw yourself away on any man.'

Madge laughed. She was happy that night. 'Perhaps you will be here to choose for me,

Dick,' she said.

'Perhaps. Who knows?' he answered.

He left her at the door. She held his hand in hers. 'Dick,' she said, 'I hope you'll forget in time, and that you'll be very happy.'

Devereux bent down and kissed her. It was a kiss a brother might have given to his sister, but somehow it hurt the girl. For the first time that night she had opened the book of life, and on the first page she had found many things that hurt her.

'There is one thing I shall never forget,' said Devereux—'to-night!' He raised his hat and turned upon his heel.

Madge watched him walk down the street, then she slowly mounted the steps and rang the bell. 'Is Miss Grace in yet?' she asked.

The butler was stolid of countenance. Moreover, he was used to the somewhat unconventional behaviour of his youngest mistress. 'Not yet, Miss Madge,' he said.

It was an hour later when Grace Lawrence entered the drawing-room, to find her younger sister seated before the fire. 'What! not gone to bed yet?' she said.

'No,' said Madge. 'Where have you been?'

'To dinner and the theatre, with Leon.'

'Captain Marchand. Look what he has given me!' Grace held up her left hand. On the third finger gleamed a diamond ring.

'Grace!' said the younger girl; 'so soon!

Why, it is only three months ago you were

engaged to Dick.

'Ah, Dick!' The elder girl crossed the room and toyed with some flowers in a vase. 'Madge, you don't understand. I was engaged to Dick because every one wished it. I never really loved him as a woman should love the man she is going to marry. But Leon!' She turned and faced her sister, and her eyes shone. The cold unresponsiveness and lack of enthusiasm she saw on Madge's face chilled her. 'Child,' she repeated, 'you don't understand, but you will some day.'

'If it means wrecking a man's life,' said Madge slowly-she was thinking of a scene she had witnessed that night—'I hope I never may.'

Devereux had a fairly long walk home, one which took him through the varied sights of London. He watched the flotsam as he passed. True, he was going home to a flat that was luxuriously furnished; but really he was one of these. The flat would be his for only a few more hours. The idea amused him. As yet he only looked upon it with dilettante eyes; he had not come to grips with the new life. He walked up the stairs, and let himself into the flat. In a sudden fit of extravagance he turned on every light; he would have luxury for a few more hours.

His man had thoughtfully left a fire burning. He flung himself into an easy-chair before it. For a few moments the mood changed, and he felt bitter—bitter with himself for his madness, bitter with the girl who more or less indirectly had driven him to it.

It was the touch of his revolver that made him remember. He took the weapon out of his pocket and laid it on the table. At the sight of it memory came back, and the mood passed.

Three days later he moved his personal elongings and sold his furniture. Then he belongings and sold his furniture. learned fully one of the first economic lessons of life-the vast difference between buying and selling.

He moved into a single room at Westminster, and went out to look for work. He searched for it until he was footsore and weary, and his whole being revolted against the insults heaped upon him.

Then, one day, he met Madge; it was in Regent Street, where she had gone for a day's

shopping.

It was she who recognised him and stopped him on the crowded pavement. 'Well, Dick,' she said, 'I have been thinking of you such a lot!'

'Have you-wondering if I should keep my word, eh?

'I knew you would do that. Have you been successful ?

To please her, Devereux lied. 'Yes,' he said, 'so successful that we are going to have tea together. We must not go where it is too fashionable.' He glanced down at his clothes as he spoke.

'Anywhere you like, Dick.' She slipped her

arm through his.

For an hour he was Richard Devereux, man about town, chatting to her about people who had passed out of his life, and things which had ceased to interest him directly, since he took no part in them; romancing so that she might not know the hidden truth.

Another month, and he stood a failure. For nearly five months he had tried to find work, and failed. No one wanted him; he was a drug

upon the market.

He looked at his money one night. By the utmost care he had husbanded it, but there now remained only two pounds five shillings and fourpence. It would last him ten days—no longer; then starvation. The idea came to him suddenly. He packed his bag and went straight to Charing Cross. There was still time to catch the night train.

He smiled thoughtfully as he sat back in the third-class compartment. Five months' grappling with the forces of nature had not destroyed his sense of romance, and he weaved a romance

about the life to which he was going.

Marseilles, on a cold winter day, with the wind blowing in from the sea. Devereux made one of the little company marching to Fort St Jean. Already the hours spent with his new companions, the members of the Foreign Legion, had destroyed much of the romance. He had been herded in the recruits' room before the doctor with the unwashed and hopeless of five nations. He had marched with them through the streets to the station, carrying his loaf of bread. Now he marched across the drawbridge to Fort St Jean, through the gate into the courtyard beyond, filled with soldiers—Spahis and Zouaves—bound for Africa by the next troopship.

A chorus of voices greeted the new-comers, rising in volume. 'Oh, là là,' they cried, 'les bleue pour le Légion!' A corporal gathered them together in a corner of the courtyard, swearing at them in voluble French; they were the sons of pigs, a disgrace to the French army. Why should he be cursed with looking after such as

they?

Devereux looked around, and the uniforms of the Spahis, with their enormous trousers, and

the Zouaves amused him.

For the rest, the romance of the Legion was fading from before his eyes. Another légionnaire came up to him and entered into conversation. He was a German who had once been a journalist—a tall, muscular fellow. There was something

about him which appealed to Devereux. So far as eye could tell, he was the only gentleman in the whole crowd. He introduced himself with a smile. 'You have been a fool like me,' he said with a shrug of the shoulders. 'English' I thought so. My name's Wessermann. I was a journalist for five years in London; that's how I know your language.'

During the voyage to Oran the two men became friends. Beyond their names they knew nothing of each other. No questions are ever asked, which is perhaps the chief reason why France has an unending store from which to draw when she wants recruits for the Légion Étrangères.

Sidi-bel-Abbès at last. Devereux looked about him as they got out at the little station. It is an ancient town, the gateway to the desert, the city of the Legion. He had little time for reflection. Bullying them volubly, the corporal marched them through the streets, with their eye-aching yellow houses, and through the narrower native streets; past a minaret, where a muezzin chanted the monotonous prayer; then to the white stone building beyond—the barracks of the Legion.

A chorus of cries met them from the windows, 'Là, là, les bleus!'

Devereux looked around him—at the crowd of légionnaires who had come to shout and jeer at the recruits, at the cruel stone buildings looking more like a prison than a barrack. He had come to forget and be forgotten. As he lay on his hard bed that night he realised how fully he had succeeded. Of name now he had none. It had been entered on the lists of the regiment; beyond that it was lost. He was no longer Richard Devereux, fool, gambler, and failure; but No. 13,846 of the Legion. Bitterness was in his soul as he lay there. As a last crowning piece of folly, believing in its romance, he had joined the Foreign Legion. Twelve hours had taught him how little romance there was save that which he purchased at the regimental canteen at ten centimes a litre.

At last he fell asleep, to dream of old days in London, of people he had known and was now chatting to in his dreams. A crowd of them passed before his eyes—years of life in as many minutes—that whole gamut of emotion of pleasure and pain which makes up life. Once or twice he smiled and murmured in his sleep.

He was awakened, still full of his dream, by the bugle calling reveille. He opened his eyes. All around him men were leaping out of bed and hurriedly dressing. Then he remembered. With sickening certainty it all came back. He was no longer Richard Devereux, but No. 13,846 of the Foreign Legion.

(Continued on page 861.)

STUDENT-LIFE IN RUSSIA.

By JEAN D'AUVERGNE.

N spite of the showers of abuse which the modern Britisher likes to pour on the poverty of our higher education, it may be admitted that the majority of people who go to a university do not regret the fact later on in life. There may be grounds for complaints; and indeed, if the aim of education be to teach independence, many instances may be quoted to show that, so far as setting up a young man in a career is concerned, the British universities fail ignominiously. But, notwithstanding all defects of system, the desire for a university life is present in the hearts of all educated people. In France and Germany a man proceeds to the university as a natural course, and in French or German business circles a university education is an asset rather than a luxury or a hindrance. Great Britain is slowly advancing to the same stage. In Russia, however, the university occupies a peculiar position. Oxford and Cambridge form the strongest link in the Tory chain; they are the home of tradition, the stronghold of the Church, and the last line of defence in an uncompromising Conservatism. The youngest of all the great European universities, the Russian University, has no traditions upon which to fall back. From the beginning of its existence it has been the rallying-point for all those who are interested in the social progress and intellectual advancement of Russia, until to-day it stands for the most progressive principles of advanced democracy. Its whole history has been an unceasing warfare with a reactionary Government, and the long struggle has not produced the best results in the modern Russian student.

In Russia there are at present, including Tomsk, eight universities, with a total roll of just over thirty thousand students; not a very large proportion out of a population of one hundred and fifty millions. Of these, by far the most important, both historically and numerically, is the University of Moscow. With it are associated many of the greatest names in Russian literature; and with it, too, is connected the political agitation which has so adversely affected Russian university life in the last ten years. The buildings themselves-grimy, austere, still marked by the bullets of the soldiery in 1905, and sadly in need of repair—give some idea of the poverty under which Russian universities labour; but it is not until one sees the Russian students in their Moscow homes that one realises the complete darkness of the gloom which has settled over intellectual Russia. The ill-fitting uniforms, the long, flowing, greasy locks, the thin, pinched, unshaven cheeks, the threadbare coats, give one the impression of an army of beggars or of some garrison that has just undergone a six months' siege. Everywhere poverty obtrudes itself in most startling fashion, and a Russian student is as like an Oxford or Cambridge undergraduate as a smart Guardsman is to an Embankment loafer.

Of the ten thousand students on the Moscow rolls not more than 20 per cent. have one hundred pounds a year. More than 70 per cent. have less than forty pounds, and a student who has fifty pounds per annum is counted well-off. Education is naturally cheap, and the various charitable institutions supported by private funds make it still cheaper. But, notwithstanding, the privations which some of the poorer students endure are very real, and life on twenty roubles a month in a town in which living is admittedly dearer than elsewhere in Europe is a hardship which cannot fail to appeal even to the poorest imagination. By sharing a room with two companions, with one free, or almost free, meal a day at the university club for indigent students; by denying himself all but the barest necessities of existence; and by trespassing on the kindness of richer friends for his books, the poor student may succeed in eking out a living on his modest budget. The desire for education is very real, and to secure the benefits the university affords no suffering is considered too severe. Some unfortunates have no money at all, but live frankly on their wits, trusting to a beneficent Providence to provide them with their daily bread. Some earn a few roubles by giving lessons, others by undertaking menial tasks such as that of nightwatchman or doorkeeper, or by doing secretarial work for illiterate merchants. The difficulties of their existence are not lessened by the severity of the climate. In winter the lack of proper clothing subjects them to all the horrors of the cold; while in summer, for those who are unable to leave Moscow and the stifling heat of its dusty streets, the foul air of a room often less than ten feet square impairs the health and ruins the constitution.

The university fees are only one hundred roubles per annum, or a sum of less than eleven pounds. Many of the students, too, hold scholarships relieving them of even this light burden; and yet there are cases where students have not the wherewithal to keep soul and body together. Last winter the director of the famous Moscow Art Theatre received a letter asking him to advance twenty-five roubles to four students who were living together in one room, and who had only one suit and one pair of boots between them. Thinking the letter was the work of a professional beggarwriter, the director sent his secretary to investigate the case. He found the four men living in a tiny garret in a dilapidated house in a slum quarter, with no other furniture than a bed and a wooden

stool. They were in a half-starved condition, and told the secretary they were accustomed to have a meal once every three days! It is the old story of the Quartier Latin, so grossly misrepresented by English writers. Only, in Moscow the students' quarter is even more sordid, more pitiable, than its Parisian counterpart.

Naturally there are also rich students. It must be remembered, however, that the aristocracy and plutocracy have no need of a university. The Lycée—which in class bears some resemblance to an English public school, and at which the pupils stay until they are twenty-three or twenty-four—confers the same distinctions and the same degrees as a university, and relieves the jeunesse dorée of the necessity of mixing with the poorer classes.

However little one may have in common with the Russian student, however much one may hate the sordid squalor of his life, one cannot withhold admiration from a class that is so evidently desirous of education and so willing to undergo suffering to obtain it. There is no doubt of the sincerity of the wish for culture. Admission to a Russian university can only be granted to those who have finished the gymnasium, and the intellectual standard of the students is probably higher than anywhere else in the world. In spite of the difficulties under which he labours, the Russian student succeeds in amassing a wonderful amount of information by the end of his four years of study. There is nothing of the fraternity of English or German student life in his career; and, being poor, he is forced to work. He will have a good knowledge of the masterpieces of European literature. He reads the English classics, but has a warm admiration for such writers as Jerome, Mark Twain, and, more recently, Jack London. Indeed, the average Russian's knowledge of English literature, both classic and contemporary, forms a striking contrast to the woeful ignorance of Russian literature that prevails in England. He will have a thorough grasp of the German philosophers and a wide acquaintance with the English political economists. He studies law or higher mathematics, and his spare time will be devoted to sociology and political science. And herein perhaps lies his chief weakness. At an early age he has assimilated a great store of knowledge which he is quite incapable of applying practically. He is an idealist who can never soar beyond the depressing reality of his own sordid existence. By the time he is twentyfour he has passed through the whole gamut of human emotions. He is already discussing 'the fourth dimension' before he has mastered his multiplication table. He marries recklessly, without money and without knowledge of the responsibilities of married life; and if he does not marry, he passes from one mistress to another. Liberty and democracy are his catchwords, and the torrent of mere words carries him away like a leaf.

On the other hand, he is capable of great self-sacrifice and sympathy for others, and what little he has he is always willing to share with his fellows. If he betrays weakness in action and in carrying out his ideals, he is quite prepared to die or suffer for them, and shows an unexpected obstinacy in upholding them. It is only by admitting this mixture of weakness and strength that one can come to grips with the Russian character. It is weakness in action which has rendered so many revolutionary movements abortive. It is a certain obstinate strength of endurance which fosters and keeps the spirit of revolt alive.

It is his zeal for progress and his thirst for liberty that cause the Russian student to devote so much of his time to the spreading of revolutionary propaganda. This is very often only a phase of student-life which passes like a calflove, but at the time it is a real and serious cause. He has a hand in most of the strikes; and, disguised as a workman, he makes his way into the big factories to preach there his doctrine of Socialism. In his life, sociology takes the place of sport, and political agitation forms his only recreation. On all sides he finds himself at variance with the Russian Government. Sooner or later he breaks his lance against the hard facts of life with deplorable results. Misdirected enthusiasm gives way to self-analysis and morbidity, and as the realities of life are forced upon him, he yields to a hopeless depression which as often as not ends in suicide or moral ruin.

It is, however, from his class that are drawn all the best forces that are working for the advancement and enlightenment of Russia. The doctors, the engineers, the great professors, the writers, the artists, the actors, the inventors, the educationalists, all belong to the university. A large number of Russian schools are supported by private charity, and it is the rich intelligenzia—that is, the rich intellectual or university class—that supply the requisite funds. The intelligenzia may have no proportionate sense of the practical in life; but in their generosity, and in their labours for the educational emancipation of Russia, they show a unity of purpose that is in the highest degree commendable.

The Government is slow—purposely slow perhaps—in carrying out or supporting educational reforms. The higher courses for women at Petersburg and Moscow—which, as women may not attend a university, fulfil all the functions of a university, and are attended in each city by some four or five thousand students—receive from the Ministry of Education the totally insignificant grant of just over five hundred pounds per annum. The balance is paid for by the private enterprise of public-spirited Russians. The expenses of the 'People's Universities,' which correspond to the university extensions and evening-schools, and which have

been very actively and successfully carried on during the last ten years, are paid entirely by

local grants or private charity.

In justice to the Government it must be admitted that the education grant has increased nearly threefold since 1905; but the money has been spent on the development of elementary schools, and the universities have profited little. Even to-day Russia only spends eleven and a half millions on education, or roughly one shilling and fivepence halfpenny per head—a very low figure compared with the nineteen odd millions that Great Britain spends on a population one-third the size.

No picture of Russian university life would be complete without some reference to the Jews. Among the ten thousand students at Moscow some three hundred are Jews. The position of the Hebrew in Russia is not a comfortable one, and his admission to the ordinary privileges of citizenship is severely restricted. Only 5 per cent. are admitted to the gymnasia, and at the university the number is reduced to 3 per cent. The result of this eliminating process is that only the cleverest Jews can enter the university; and as there is no room for idlers among them, they very frequently earry off the highest honours. It is one of the most striking tributes to the pertinacity of the Jewish character that even in Russia, where every possible hindrance is placed in their way, they have come to the top in almost every branch of trade and industry. Not unnaturally the Jewish students are almost always active participators in the dissemination of revolutionary propaganda.

The present position of the Russian students is a little difficult to define. As may be seen from the very slow rate of increase in the official grants for education, they are not viewed at all favourably by the Government. The failure of 1904-5 has given a set-back to the intelligenzia from which it will take them years to recover, and the ideals of the students have suffered in consequence. The rate of suicide is very high, and is a direct result of the state of depression into which the intellectual classes have fallen. Failure, combined with the imitative emotionalism of the Slav character, has set the fashion to self-murder; want of proper recreation and deplorable conditions of life have done the rest.

For years the student classes have seen their hopes alternately raised and dashed to the ground with irritating consistency, until to-day their position is little better than it was sixty years ago. The message of contemporary Russian literature in relation to life may be summed up in the words à quoi bon? and in them the student finds unconsciously the echo of his own mind.

It is a dark picture, and the outlook is not bright. It is the alarming precocity of the Russian youth that furnishes the greatest danger to the future of Russia. He begins to live by the time he is fifteen or sixteen, and the number of schoolboy crimes is quite abnormal. 'The boys of to-day are the men of to-morrow; and there is little to be expected from a class that has already exhausted all the emotions of life almost before it has come of age. Much will have to be done in the way of hygiene, in providing better quarters for the students, and in altering a system which provides only for instruction and leaves education to fend for itself. But reform, when it comes, must come from the students themselves. As a class they can well afford to shed some of their self-analysis and soul-introspection for a much-needed force of character. Some provision, too, should be made for the exuberance of youthful spirits whose only outlet at present is the dangerous game of politics. One of the most pleasing signs is the growing interest taken by the student in sport, and more especially in lawntennis and Association football. The time is for ever past when the Russian professor considered football a game fit only for Englishmen and barbarians; although from the way the game has been taught and shown by the Moscow Britishers, the remark was singularly apposite. Last year a team of Moscow students took the field for the first time; and, though the game is only in its infancy, the sport has come to stay in Russia, and with it may come the regeneration of the Russian student. It may make for a commonplace type; it may cause the disappearance of the picturesque but much-to-be-pitied student of the present, but it will assuredly help to create a healthier interest in life and a proper appreciation of manhood amongst all classes. And in this it will have served its end.

A KNIGHT ON WHEELS.

By IAN HAY, Author of The Right Stuff, A Man's Man, Happy-go-Lucky, &c.

CHAPTER XX.—continued.

1.

'I SAY, Philip, old son,' remarked Tim as they walked down Piccadilly the following Sunday afternoon, 'are you aware that our office has become a home of romance?'

Philip did not reply. His thoughts for the | to Coventry and see Bilston again.'

moment were centred upon more absorbing business. Presently he said, 'I think I shall take a long run to-morrow, and give it a proper trial on one or two really bad hills, and then go down to Coventry and see Bilston again.'

Tim sighed gently, and replied, 'Permit me to remind you, oh most excellent Theophilus'—this was his retaliation for being addressed as 'my son Timothy'—'that to-day is the Sabbath, and that we have left the Britannia Motor Company and all its works, including the Meldrum Never-Acting Brake, behind us for the space of twenty-four hours. In addition, we have washed ourselves and put on celluloid dickeys, and are now going to the Park to see Suffragettes. Let us be bright.'

'Did I tell you the patent had been granted all right?' pursued Philip, referring presumably to the Meldrum Never-Acting Brake.

A War 1:1) and Time and market

'You did,' said Tim resignedly-seven times

yesterday and five this morning.'

'The company simply must take it up,' continued the single-minded inventor. 'The brakes of the Britannic cars have always been their weakness, and now that we are building heavier and heavier bodies things are riskier than ever. Our present brake-power can't be developed any further; even Bilston admits that. My brake is magnetic—a different principle altogether. Its reserve of power is enormous. It would stop a motor-bus.'

'Yes, dear old thing,' said Tim soothingly.
'I am sure it would. And if you don't come out of the gutter on to the pavement you will stop one too, and then I shall have to waste a day taking you to Kensal Green in instalments.' He linked his arm in that of his preoccupied friend, and, having drawn him into a place of safety, repeated his former question: 'Are you aware that our office has become a home of romance?'

Philip replied that he had not noticed it.

They were on their way to the Park, after the fashion of good citizens, to enjoy the summer sunshine and regale themselves with snacks of oratory upon divers subjects, served gratis by overheated enthusiasts in the neighbourhood of the Marble Arch. After that they were to take tea with Timothy's lady mother in Lowndes Square.

'Well, it has,' affirmed Tim. 'Citizen Brand is consumed by a hopeless passion for the haughty

Jennings.'

'Rot!' said Philip, interested at last. 'How do you know?'

- 'I was having a brief chat with Miss Jennings the other day'---
 - 'What about?'

'We were discussing the affections, and so on,' was the airy explanation; 'and when, in the course of conversation, I happened to mention Brand's name, the poor young creature turned quite puce in the face.'

'That rather sounds,' commented the unsophisticated Philip, 'as if the hopeless passion

were on Miss Jennings' side.'

Tim wagged his head sagely. 'Oh dear no,' he said. 'Not at all. In a woman that is a

most misleading symptom. She told me all about it. I notice,' he added modestly, 'that people confide in me a good deal.'

'My son Timothy,' said Philip, 'you are a

gossiping old wife.'

'The difficulty, I gather,' continued Timothy, quite unmoved by this stricture, 'lies in the fact that they seem to have nothing in common whatsoever. Otherwise they are admirably matched. Socially, Miss Jennings is a young lady, while the Citizen is only a mechanic, like ourselves. In politics Miss Jennings is a Conservative, while Brand is an Anarchist. In religion Miss Jennings is Church of England, with a leaning to vestments; whereas Brand thinks that heaven and earth were created by the County Council, under the supervision of the Fabian Society.'

'I should have thought that it would have been a most suitable match,' said Philip. 'They would be able to bring each other such fresh

ideas.'

'That is just what I told her,' said Tim; 'but it was no use. She said he was only a common person, and did nothing but fill his head with stuff that would put him above his station—night schools, and debating societies, and Ruskin, and art galleries.'

'It seems to me rather a laudable ambition on

the part of a common person.

'So I said, but I soon gathered that I had said the wrong thing. It appears that the Citizen has been trying to elevate Miss Jennings' mental outlook too. He took her to the theatre, and that seems to have put the lid on everything.'

'Why? I thought she liked the theatre.'

'Yes; but the situation was mishandled. They met by appointment outside a Lyons' tea-shop—Miss Jennings in a dressy blouse and the Citizen in the suit which he only wears as a rule on the anniversary of the taking of the Bastille—and proceeded to a hearty meal of buttered buns. Then, instead of being taken to see Lewis Waller, as she had secretly hoped, Miss Jennings found herself at the Court, listening to a brainy rendering of *Coriolanus*, played by an earnest young repertory company without scenery or orchestra. I gather that they parted outside the emergency exit, and went home in different buses.'

Philip listened to this highly circumstantial narrative in silence. Finally he said, 'I'm sorry for Brand. He may not be up to Miss Jennings' standard of gentility; but he is the best man we have, and I intend to make him foreman next week. I bet you he finishes high up in the company's service.'

Tim shook his head. 'We shall see,' he said. 'Meanwhile, let us go and study the Suffragette in her natural state. I hear the Cause received a tremendous fillip last Sunday. Two policemen

were jabbed in the eye with hatpins.'

But the Suffragettes were not so conspicuous as they had expected. They did discover a group of intensely respectable and consciously virtuous females haranguing a small and apathetic audience from a lorry; but these had wrecked their chances of patronage from the start by labelling themselves (per banner) 'Law-Abiding Suffragists.'

'We want Ettes, not Ists,' said Tim.

At length their attention was attracted by what looked like a gigantic but listless Rugby football scrimmage, some four or five hundred strong, slowly and aimlessly circling about upon a wide grassy space. It was composed mainly of anæmic youths smoking cigarettes. But there was no sign of the ball. All that indicated the centre of activity of this peculiar game was the sound of some twenty or thirty male voices uplifted in song-Timothy explained that the melody was 'Let's all go Down the Strand and have a Banana'-somewhere about the middle. A couple of impassive policemen appeared to be acting as referees.

Timothy addressed a citizen of London who 'What is going on inside was standing by.

here?' he asked.

'Sufferingettes, sir,' responded the citizen affably. 'The police won't let 'em 'old no meetings now-not off no waggin', that is-so they 'as to just talk to people, standin' about, friendly like, same as me and you. There's a couple of 'em in there just now,' indicating the scrimmage with his pipe. 'You'll 'ear 'em arguin' now and then.'

He was right. Presently there was a lull among the choristers. A high-pitched girlish voice became audible, trickling through the press, 'And I ask all of you, if that isn't woman's work, what is?'

The speaker paused defiantly for a reply. It came at once: 'Washin', ducky!'

The crowd dissolved into happy laughter, and the choir struck up, 'Meet me in Dreamland to-night.

Philip and Tim moved on. Philip felt hot and angry that women—apparently young women -should be subjected to such treatment as this. At the same time he remembered Miss Jennings' dictum upon the subject of asking for trouble, and wondered what on earth the parents of the

youthful orators were thinking about.

Presently they came to a group near the Marble Arch. It was being addressed by two speakers simultaneously. The first was an angrylooking old gentleman with a long white beard. He was engaged in expounding some peculiar and—to judge from his apparent temperature highly contentious point of doctrine to a facetious audience; but it was impossible to ascertain from his discourse whether he was a superheated heresy-hunter, an evangelical revivalist, or an out-and-out atheist. This is a peculiarity of the Hyde Park orator. Set him on his legs, and in ten minutes he has wandered so far from the point—usually through chasing an interrupter down some irrelevant byway—that it is difficult to tell what his subject is, and quite impossible to discover which side he is on. As Philip and Timothy strolled up, the bearded one parted company with the last shreds of his temper, chiefly owing to the remorseless hecklings of a muscular Christian (or Atheist) who was discharging a steady stream of criticism and obloquy into his left ear at a range of about eighteen inches; and partly by reason of the distraction caused by the voice of the other speaker-a pockmarked gentleman in a frock-coat and bowler hat—who, with glassy eyes fixed upon some invisible text-book suspended in mid-air before him, was thundering forth a philippic in favour of (or against) Tariff Reform.

With gleaming spectacles and waving arms, the old gentleman turned suddenly upon the heckler. 'Out upon you!' he shrieked. 'I despise you! I scorn you! I spit upon you?

Plague-spot!'

'What abaht the Erpostle Paul?' inquired the Plague-spot steadily, evidently for the hundredth time.

This naturally induced a fresh paroxysm.

'Miserable creature!' stormed the old gentleman. 'Having eyes, you see not! Having ears, you hear not! What did Charles Darwin say in eighteen-seventy-six ?'

The crowd turned to the heckler, anxious to see how this thrust would be parried. The heckler pondered a moment, and then inquired in his turn, 'What did the Erpostle Paul say in one-oh-one?' The crowd, evidently regarding this as a good point, laughed approvingly.

'I'll read you what Charles Darwin said,' spluttered the old gentleman, producing quite a library from his coat-tail. He selected a volume, and turned over the leaves with trembling

fingers.

'And now, gentlemen, as regards this question of Exports and Imports,' chanted the Tariff Reform expert, 'I will give you a few facts.'

'Fictions!' amended a humorous opponent.

At this moment the old gentleman began to read, in a hurried gabble, what Charles Darwin had said in eighteen-seventy-six.

The heckler allowed him two minutes, and then suggested cheerfully, 'And now let's git

back to the Erpostle Paul.

And so on. Our friends moved away, for not far off Philip's eye had discerned a familiar figure gesticulating upon a rostrum. Brand. He was addressing a considerable crowd, upon the edge of which Philip and Timothy now took their stand. Philip had never seen his colleague out of his overalls before, and was struck with the man's commanding presence and impassioned delivery.

'Life!' shouted Brand. His face was dead white, but his eyes blazed. 'Life! What does Life mean to you?' He surveyed his audience

with profound contempt. 'Beer!'

The crowd accepted this bludgeoning in ex-

cellent part.

'What do you do with Life?' continued the speaker—'the Life that is left to you when you have worked twelve hours a day for some capitalist, and slept eight more, and spent another two coming and going from your work—your spare time, I mean? How do you employ your Sundays? Do you go and study Nature? Do you read elevating literature? Do you cultivate your starving minds? No! What do you do? You can't think of anything better to do than to come here and listen to fools like me! That's the sort of mugs you are!'

This summary of the situation met with hearty endorsement from all parts of the audience.

'But it ain't your fault,' continued Brand compassionately. 'You haven't ever been taught what it means to enjoy Life. You haven't got the time!' He raised clenched hands to heaven. 'Life! Life! It should be beautiful—glorious—sublime! Look round you now! Look at those trees! Listen to that music!'

The crowd, docile but a trifle mystified, obeyed. Faintly to their ears across the Park came the tremendous chords of the Pilgrims' Chorus from Tannhäuser, played by the Grenadier Guards'

Band.

Brand sank down over the rail of his platform until his arms hung limply before him. 'Do these sights and sounds thrill us?' he demanded hoarsely. 'Do they move us? Not a thrill, not an emotion! Why? Because we haven't been educated up to them, you and me. We're only the People. We've always had to go to work, work, work! There's never been any time for us to learn of the beauty that Life holds for us.'

The crowd was listening now, as it always

will to a cri du cœur.

The man swept on, all aflame. 'Take music! What does it mean to us? Nothing—absolutely nothing! Can you and I interpret a symphony? Not on your life; we've never been taught!' His voice rose to a scream. 'And what sort of music do they hand out to us as a rule—us,

the People!—yes, and we lap it up? Ragtime! R-r-ragtime!

Philip and Tim turned away soberly enough. The spectacle of an immortal soul beating its wings against prison-bars does not lend itself to flippant comment.

'The Citizen may be a muddle-headed crank, Phil,' said Timothy, 'but he is a man for all

that.

Philip did not hear, though he would have agreed readily. He was wondering why the haughty Miss Jennings should patronise Mr Brand's meetings. Still, there she was, endeavouring to take cover from his observation behind a small but heated debate which had arisen between a gentleman with a blue ribbon and another with a red nose. Timothy caught sight of her too, and promptly rushed in where Philip feared to tread.

'Good-afternoon, Miss Jennings!' he said.
'I'm surprised to find you, with your strict Conservative principles, coming out to encourage such a low entertainment as this.' He indicated Mr Brand, now working up to a peroration.

Miss Jennings stiffened indignantly. 'I suppose I can come out and amuse myself listening to a pack of nonsense if I like, Mr Rendle,' she said, 'the same as any one else!'

'What do you think of Mr Brand as a

speaker?' asked Philip.

'I wasn't listening to him particularly,' said Miss Jennings untruthfully.

'What do you think of his views on ragtime?' inquired Tim.

'I think they are silly.'

'Can you interpret a symphony, Miss Jennings?' asked Philip.

'No,' confessed the girl reluctantly; 'I can't

say I can.'

'I believe you are a Socialist too, Miss Jennings,' said Tim, shaking his head sadly.

Miss Jennings, after an unsuccessful attempt to wither him with a glance, passed on.

(Continued on page 356.)

THE SEAFOWL ON THE FARNE ISLANDS.

By SARAH WILSON.

ABOUT midway along the north-eastern coast of Northumberland, whence we may see both Bamborough Castle and Holy Island close at hand, the great gray sea is studded with a group of small rocky islands known collectively as the Farne Islands, and individually by various names, such as the Wide Opens, the Brownsman, the Knoxes, the Pinnacles, the Megstone, the Kettle, and so on. The nearest to the shore is not much more than a mile away, and the most distant is not less than seven or eight miles seaward. There is a lighthouse on two of them,

and on one is a strong medieval peel-tower. As the tides rise and fall some of the smaller of these isles are covered and uncovered by the sea, and consequently lost and disclosed to sight alternately; hence there is some diversity of opinion as to their exact number; but for the purpose of these notes there may be said to be about seventeen of them, more or less. With the exception of the caretakers of the lighthouses, they have been uninhabited for many years save by birds, of which there are a great variety and a very large number. At some seasons the birds

and their broods are so numerous that venturous visitors have found it difficult to avoid treading

upon them.

Some of these islands were not, however, always uninhabited. We are told in olden chronicles, or the book telleth—to use the old phrase—that St Cuthbert used to retire to the one now known as the House Island from the monastery on Holy Island to be less disturbed in his meditations and pious contemplations; and at a later date a small Benedictine Priory was established there from Durham. It is on record that Edward the First granted this little community ten quarters of corn and two tuns of wine annually, to be paid by the mayor and bailiffs of Newcastleon-Tyne; and that the King of Scotland granted the recluses eight shillings sterling, to be paid to them annually out of his mill at Berwick.

The old Anglo-Saxon poets spoke of the sea as the swan's road and the water street, also as the gannet's bath; and have left us-earthlings they called us others—various descriptive touches; but none are more arresting than the details of the romance enacted in 1838 in the gallant rescue of the shipwrecked crew and passengers of the Forfarshire by Grace Darling, whose father, it will be remembered, was the caretaker of the lighthouse on the Longstone. Wordsworth set her brave deed into jewelled verse, and the public subscribed to place a monument to her memory in Bamborough churchyard; but the islands will be for ever most closely associated with her heroism. Queen Victoria, as she passed to Balmoral in 1842, thought well to write in her diary that she saw Farne Island, with Grace Darling's lighthouse upon it.

The temptation caused by the profusion of seafowl and their eggs led to frequent appropriation of them by unauthorised persons. Sometimes visitors would carry away pailfuls of eggs, and deal considerable destruction among the birds as well. Eventually, a few years ago, an association was formed for their protection and conservation, and the islands were rented and watchers placed in charge of them. From time to time the honorary secretary of this association issues reports of the events and conditions of this bird-world, and from them we gather the following facts.

There was in 1912 a good breeding season, and very few of the young birds died. There were more than a thousand nests of Arctic terns on

the Brownsman; and though but two pairs of roseate terns were noticed in former years, there were four or five observed that season feeding their young, of which two pairs had established themselves on the Knoxes. A great number of cormorants nested on the North Wamses, but moved on eventually to the Harkus on account of annoyances from the gulls; whilst others settled on the Wide Opens, and hatched their broods. The secretary noted a great increase in the number of puffins, which was so considerable as to threaten to destroy the vegetation on the islands. Eider ducks were doing more than usually well on most of the islands, though as many as seven eggs were seen in one nest in a former year, and five and six were common.

A great noise will sometimes draw a watcher's attention to attacks on some of the birds by One watcher, hearing a disturbance on an isolated rock where a gull had hatched three young ones, found that some black-backed gulls had taken possession of the place, and that the nest was empty and the parents had disappeared. Among the rarer birds observed by the watchers were the gray phalarope, black tern, black guillemot, night-jar, landrail, turtledove, tawny owl, and mountain-linnet. A report in 1895 mentions that a heron built a nest about four feet high on the Wide Opens, and laid four eggs, but they were stolen. This was before the watchers were appointed. Curiously, the Sandwich terns left the islands the day after the watchers commenced their surveillance. Altogether, the Farne Islands, whose history may be said to have begun in the days of St Cuthbert, and to be illuminated by the distinctive songcraft of the Anglo-Saxon poets, are of incommunicable interest; and their peculiar population of birds, migrant and resident, has a fascinating charm. The great gray sea rises and falls among the narrow passes or paths between some of them, well known to local sea-crafty men, the sun and the moon 'take up the wondrous tale' according to their laws; and as we look upon them we feel we have come upon a new world within our own. An army of cormorants on the steep rocks of the Pinnacles seems to be ready to resent our intrusion; and when they were visited by the writer, a whale was sighted in the act of spouting as it drove a shoal of herrings toward the shore.

HUMOUR AND THE HOUSEWIFE.

By KATHARINE BURRILL, Author of Corner Stones, The Amateur Cook, &c.

AT the first glance it hardly seems possible that humour can walk hand in hand with the careworn housewife. Is it humorous when the pipes burst, or the coal does not come, or the roast is burnt to a cinder or—like David Copperfield's mutton—raw? Till we read Mrs

Dowdall's illuminating volume, The Book of Martha, we mourned over the mutton, and wept when the porridge was burnt; no amount of unexpected music on the part of the pipes tempted us to dance. Dully, unsmilingly, with haggard cheek, we wrestled with the tradesman who sends

more than we ordered, and the tradesman who never sends at all. Pale and wan, like the discarded lover of the ballad, we set our teeth and grappled with dust, dishcloths, and incompetency. Mrs Dowdall arises like a star from a dust-heap, and tells us 'Ruth's favourite dishcloth looked like a dead rabbit in a bucket of castor-oil.' We laugh, and from now onwards we feel differently towards all dishcloths; in unexpected places they are no longer eyesores and miseries, but lineal descendants of the immortal Brer Rabbit. Laurence Sterne says somewhere that his spirits have never deserted him, or 'tinged the objects which came in my way either with sable or with a sickly green.' The witty authoress of The Book of Martha might say the same thing, and it is surely a subtle compliment to mention one of the great English humorists in connection with household tasks made radiant with laughter and gay with merriment. No object that comes in Martha's way is ever touched with 'sickly green,' nor is it sugared over with sticky pink and sentimental white; there is no 'linked sweetness long drawn out' about Martha. Facts are facts, but facts are also funny; and Martha's attitude toward life is that if we can find a laugh lurking in a pound of treacle or a joke concealed in a keg of soft soap, why, let us laugh. Now, most housewives do not laugh; like John Brown's sheep-dog, they find life 'fu' o' sairiousness.' We are not sure—judging by the rows that often dim the joyful lustre of the household —that many housewives are not on the sharp lookout for 'mair fechtin'.' You cannot laugh and fight; you cannot laugh and scold; but you can laugh and make the family chariot-wheels revolve briskly and happily to the sound of your merriment. If you feel you are incapable of this, read The Book of Martha, and see how it is done.

We have already mentioned Sterne, and we suppose it is quite unquestionable that the greatest humorists have been men. If we had to say why men claim almost a monopoly in humorous writing, we should be inclined to say because they are free of the frets and jars, the small annoyances and worries, that fill a woman's Think how a man's literary efforts are respected. The hush in the house; the maid importuned not to bang the Bissell sweeper up against the door of the study—oh that study! think of Cyrus Bantam!—the children bribed, cajoled, inplored not to make a noise; the organgrinder, pence in his unwashen palm, chased from before the house; the sellers of decaying vegetation and blocks of salt hastily bidden to Yes, when the Master is leave the scene. working it is very important; but when the mistress tries to capture anything approaching a 'fine careless rapture,' and place her poor thoughts on paper, no one stays the Bissell's mad career; she sandwiches visits from plumber and gasfitter between the verses of her soul-stirring poem; she finds the Master's boots (to be soled and heeled), and gives them to the blue-bagged boy, leaving Edwin and Angelina rent asunder, or just meeting for the first time. In the midst of the essay that is just getting under way she goes cheerfully to the dining-room and carves the beef, and keeps the baby's fingers out of the jam. How Martha ever wrote her book is for ever 'wrop in mystery;' but she can be eloquent over interruptions—only, of course, she treats them humorously. But then what does Martha not treat humorously? The doctor's visits (Martha has met many doctors, all with marked idiosyncrasies), the advent of the little dressmaker (chiefly pins and incompetency), the illness of the butler, the dinner-party when Ruth 'was at her wits' end,' the ministrations of Mrs Muff the washer-lady, who clamoured for another dryinggreen or a better quality of soap. If adventures are to the adventurous, certainly fun comes to the fun-lover, for out of such unpromising material as household cares and worries and bothers Mrs Dowdall has given us a book that will be a joy and delight to every housewife, and, we trust, a liberal education to every husband. Martha's own husband, James, is a most understanding person: witness his marked intelligence in the chapter dedicated to shopping; how responsively he sympathises with Martha over the ghastly, unintelligible names given by shop-walkers and shop-assistants to 'harmless, necessary' articles of clothing. Perhaps the 'Shopping in London' is the gem of Martha's volume, it is so full of observation, and so true. We thought of Martha two days ago, when in pursuit of silk cord, and were told we should find it in the habby' -which is, we presume, a pet-name for haberdashery.

But Martha does other things than shopeconomically and attend to the ways of her household; she occasionally indulges in foreign travel, and a very delightful description is given of Martha's experiences on a night journey, her sufferings at the hands of Roman guides (voluble and insistent), and her entirely original views on the subject of Tintoretto. We now look upon Tintoretto quite differently; and it would be instructive if Martha would only visit more picturegalleries, only she says she won't. We like to feel Martha has turned her household cares and her many difficulties to such enchanting use; she seizes a saucepan, and with a twirl of her hand it is a golden goblet brimful of the wine of happy laughter. Her rolling-pin, instead of being plastered with dough—possibly heavy—is a fairy wand that, touching homely things—and, worse than homely, dull things—makes them appear shimmering with the dewdrops of wit and scintillating with the sparkle of humorous thought. Black care may ride behind the horseman; but he can still ride erect, straight forward toward the dawn; if he can keep a smile on his lips and try to think of that unpleasant dark care with a lurk-

ing hint of laughter, his horse will have a lighter load. There are cares and troubles that, alas! we cannot laugh away; there are hills to climb that need all our courage, and leave us no breath to laugh with; but undoubtedly it is the merry heart that goes all the way, and the sad that becomes daunted and despairing before it reaches the first milestone. If there is anything or any one during life's journey that helps to give usif even for a few hours—a really merry heart, let us offer them all praise and gratitude. Great thoughts may come from the weeping philosopher. He may inspire us to higher things; he may teach and ennoble; but there will always be room in the world for the philosopher who could weep, but laughs instead. Instinctively we think of that laughing philosopher who made jokes of his many misfortunes and puns of his troubles. Thomas Hood had enough to try him and make him despondent; he might have chosen tears, but he resolutely chose laughter. Is there not something almost too tragic in the dying jester still clinging to his cap and bells? 'I drop these few lines as in a bottle from a ship waterlogged and on the brink of foundering, being in the last stage of dropsical debility; but, though suffering in body, serene in mind. So, without reversing my union-jack, I await my last lurch.' Well, is it depressing? Surely not; the mind and heart flutter aloft with that gallant flag that was never reversed. Any one can be dreary and gloomyit's the easiest thing on earth; but to keep a bright face when things go wrong, to laugh in the well-known face of that old curmudgeon Disappointment, sometimes takes a good deal of courage. Can we, then, be grateful enough to those who have cheered us with wit and humour and gay quip and sally? We all need to be helped along our way; we all crave some of that fill of tobacco Robert Louis Stevenson wishes us to pass round. Alas! some of us have none to pass, and we sit dolefully contemplating an empty pipe; then how our hearts leap up when some one appears with a well-filled pouch ready to share it with us all! Humour is the tobacco of life; you might argue it is useless, that it ends in smoke, that we might be better without it (this is open to question); but all honour and gratitude to those who possess it and who 'pass it round and let us have a pipe before we go.

LINGERIE.*

By Mrs George Crichton Miln (Louise Jordan Miln).

IT was abominably hot in the office; the very machines seemed to fret and sizzle as the tired girls click-clacked away at the keys. It was nothing new for the girls to be tired and impatient toward six o'clock, and in such July weather as this it was excusable. But it was something decidedly new for the manageress, Mary Field, 'forty if she's a day,' to be more tired and more impatient of the lagging clock than any girl there; and, instead of being nearly six, it had only just struck two.

Marjory Brown, watching the older woman amusedly, could not recall that she had ever before seen Miss Field flag or show any inclination to slack work. But to-day Mary certainly seemed tired and uninterested. Twice in five minutes she had looked petulantly at the clock, and there had been a distinct edge to her manner in negotiating with the free-lance journalist who had eloquently disputed his bill of seven-and-six, almost tearfully demanding its reduction to twoand-eight, declaring that he never, never paid over sevenpence a thousand, and three ha'pence a thousand for carbons, and he was quite sure she had overcounted his story by at least a hundred and fifty words. Mary had held her own and carried her point—it was her way to do so. And the man of genius had departed, heatedly promising to let his bad spelling and nopunctuation-whatever enrich some rival typewriting establishment in the future. But Mary had not held her own quite deferentially or carried her point quite smoothly; and that was most unlike her usual way.

Again the manageress looked at the clock. What could the matter be?

Miss Field beckoned Marjory into the tiny inner office. 'I am going home,' Mary said abruptly. 'Will you take charge, please, Miss Brown? Lock up very carefully at six. See that the windows are closed. The janitor will let me in in the morning. I'll be here first, as usual. You can give me the keys when you come.'

Marjory Brown nodded. She was neither reticent nor taciturn as a rule, but just now she was too amazed to speak. She herself had been in this office for six years, and never before had Mary Field left it until every one else had gone. First to come in the morning, last to go, working often late into the night, if the work crowded, such had been Miss Field's rule for almost as many years as Marjory had lived; and the girl knew it. More than once Mary had omitted to take a due holiday, and not seldom she brought to the office on Monday morning a roll of papers that told of work done at home on the Day of Rest. A life of drudgery it seemed to the girl, who was thirstily waiting now for Saturday afternoon and a long bicycle ride in the country with Dick, tea at some quiet wayside inn, and back in the dusk with wildflowers at their handle-bars.

^{*}The author reserves the book and dramatic rights.

It was a life of drudgery, but it had been gallant, willing drudgery, and not unrewarded. Mary Field had saved a little money-not much, but some—and she realised the incalculable difference between small savings and none; and only the week before Mrs Thomas, founder and proprietor, who came to the office less and less each year, had given Mary not only a nobly carned rise of salary, but a modest interest in the business. Mary's hours were all dull, but far less dull at the office, where the dozen girls, for all the monotony of their work, and for all the trouble of their carelessness and inaccuracies and sheer stupidities, brought something of spring and joy into the woman's dwarfed existence. And that, quite as much as her innate loyalty and love of her work-for she did love it—had made her never anxious to leave the office, and always willingly prompt to return to it.

But to-day she had suddenly felt that she must get away from it all. At last she yielded to her impulse; she had to. She put on her hat and veil and gloves quietly, and went quietly; and Marjory Brown, sensing that 'something was up,' by no means divined that Mary Field was running away, feeling that if she did not she would smash a machine or two. Marjory had felt that way herself once or twice, but she could not have believed that such maiden fury could be shared by quiet Miss Field.

Across the Strand, through Cockspur Street and Waterloo Place, Mary walked briskly on, in spite of the horrid heat of the day, a pleasant, refreshing figure in the trim dark-blue linen dress, more than one man thought, as he paused to wipe futilely his sweat-stricken face. For, the strain of the office escaped and her odd impatience gratified, Mary was contented and even radiant now. She slipped a silver three-pence to a limping barefoot boy, bought a red smiled an encouraging negative at the boys plying a brisk trade in Japanese paper sunumbrellas.

She walked more slowly after she had turned into Regent Street. She had business in Regent Street—important business. Through all her years of pinch and stress Mary Field had harboured, and not infrequently indulged in, one extravagance; she adored, and when she could -and far more often than she should—she bought, delicate underclothing. Dressed always like some secular nun, or a human and not iridescent pigeon, her plain, dark gowns hid usually some treasure of fine tucks and dainty She loved her needle, and she had cause to, for it had solaced and made endurable much loneliness; but now she had to buy most of her lingerie, she had so little time to sew. She was going to buy some now in Regent Street-petticoats, to be explicit, dainty, soft, and white; for this working-woman had a taste above bodylinen heavy with insertion, run with wide pink

or blue ribbons, and vulgar with long satinbows.

Her shopping done, she took a taxi home. That too was extravagant, but she was anxious to get there. She was very tired, and, also, she wanted to watch a while the Westminster boys at their cricket.

Such of her girlhood as she had not spent in India with her parents she had spent in Vincent Square with grandparents. Their house had long since been pulled down, making way for an up-to-date hospital; but Mary's first act after her financial betterment had been to search Vincent Square for apartments. She had found just what she wanted on the west side of the square—two front rooms—the 'drawing-room,' and for her sleeping-room the room above it. Again extravagant! But she planned to make this place her home, staying permanently where her best days had been spent; and she determined to make her home-hours as comfortable as she prudently could. Her large, airy bedroom was her particular delight. She went to it now at once, and sank contentedly into the big chair that stood by the open window. She looked across the old playing-fields—their green worn bare and dun here and there by active boy-feet -and her eyes filled a little because Ralph, her brother, who had played there—Ralph, her 'pal' and pride—was gone and dead. The maple-trees bent to her in the welcome wind. She threw off her hat, pulled off her gloves, and undid the parcel on her lap—three soft white petticoats. She fingered the delicate muslin appreciatively; but still her eyes were out of the window, watching for the boys who had not yet come, rested by the grateful swaying green, kindling as they always did at the glimpse, beyond the trees, of the Senate House of our Empire, gray and beautiful between the wonderful gray river and the sacred gray Valhalla of our Abbey-shrined heroes. Above the House of Lords flew the great flag—the flag for which her brother had died at Quetta, as their father had in Burma. Beyond St Margaret's she saw the incongruous dome of the new Methodist building, and disliked it because it was new, and because of its trumpery brazen apex of gilt. She leaned out of the window to bathe her face in the fresh breeze, and to her left she saw the square Byzantine tower of the Catholic Cathedral, higher than the highest point of Westminster Palace or of the Abbey, and in a sense not less but more significant than they. It too was new since her girlhood. But it appealed to her. She missed its significance, and its prophecy, But it touched with Orienand its warning. talism the Occidental convention of the picture, and for that, but unknowingly, she liked it.

Yes, the petticoats were admirable, quite as nice as she had thought at the shop. She sighed with feminine satisfaction, and drew her work-basket to her lap. Still watching for the

boys, she marked, as she always did such things, her purchases. It did not busy her swift needle long. The 'Cash' names were ready to her hand—'M. Field,' machine-written in red. Mary had had them in blue once; but the blue washed dull, and the red she found proof against the wickedest washerwoman. So 'M. Field' in bright red the new petticoats were labelled. Then they were put away in their proper drawer smoothly, with white bags of sweet lavender between.

She stood for a few moments watching the boys coming now across the grass. She loved cricket with all her soul, this demure little Briton, but she was too tired to watch long to-day. The heat was blinding. She drew down her window-shade, undressed, and slipped into a nightgown; drew up the blind cautiously, and slipped on to her cool, inviting bed. It stood against the back wall; but she could still see from her pillows the tops of the waving trees, and mark the moments on Big Ben, and she could hear the cheering of the boy-voices that she adored, pathetically, as childless women always do, whether they know it or not.

She had hung up her dress carefully, put out her dusty boots, and laid neatly on the sofa between the two open windows her more intimate garments—a strangely dainty array for the everyday wear of a merely comely 'old maid' who until recently had earned but two pounds a week. This woman loved to knit, and knitted exquisitely; that and some Sabbath-breaking, if all the truth must out, accounted for the silk vest that would have been a startling price at any self-respecting shop. But the petticoat, the silk stockings, and the garment that looked rather like a smock, but was not, must be set down frankly to extravagance.

Cricket raged. The summer wind grew high. The tired woman dozed, then slept. But on the green and gray-worn playing-field there was no sleep. The intolerable heat seemed to stimulate the boys; they played as if infuriated. It was a glorious game, and the young spectators clapped and yelled and walked about briskly, as if they were trying to keep warm. Here and there a brace of older boys sat on low canvas chairs and kept comparatively quiet, but not alarmingly so; and they did not sleep. Under a big maple-tree, the tree that was the nearest delight of Mary Field's window-gazing, a group of middleaged men sat, talking gravely. They were professors, and a friend, a gray-haired, gaunt-faced fellow, whose looks proclaimed him the Anglo-Indian colonel that he was not. He was a man of minor letters and a rapt Egyptologist; and neither he nor his scholastic hosts were paying much attention to the cricket. He had never rightly valued any sports more modern than the Nemean Games, the chariot-races of Rome, or the play-makings of the Ptolemys; and the schoolmasters had long since had the sharp edge of their appetite for sports and boys somewhat blunted by a surfeit of both.

'There's wind enough to blow a haystack down,' a boy with a very red head was saying to a boy the colour of whose hair is indescribable, because it was cut too short to be seen, when a sudden uproar arose—a violent storm of hot wind and a joyous clamour of mad boy-voices.

'Good lord!' exclaimed an astounded tutor, 'Heaven help us!' added one of his confrères, another went white, and the Egyptologist cried out—it was very commonplace of him—'My hat!' as Miss Field's unmistakable petticoat blew out of her bedroom window across the street, and caught in the branches of the maple-tree.

At that moment Mary woke with an eerie sense of disaster. Was it burglars? No; she had locked her door; she always did before she so much as took off her boots. Was it fire? She saw none, and could smell none. was it? Ah, a tornado of July air! Her belongings were pitching and tossing about the room as if they were the corps de ballet at a spiritualistic dark séance. A handkerchief had fluttered to her hair-brush; papers were scattered like autumn leaves about the carpet. With clearing mind and a nervous gasp, she looked at the sofa. Thank fortune, they were there! Stop! No! Sweet heavens! where was her petticoat? She looked under the bed and down the water-jug, one frightened, desperate glance about the room; then, forgetting her night-gown and her dishevelled hair, she rushed to the window and—shrieked!

Approximately one hundred and seven young Englishmen, and three or four from foreign parts, shrieked too, for at that instant the inconstant wind tore the eloping undergarment from its maple moorings and flung it earthward, and twisted it tight and intimate about the neck of the grim-faced Egyptologist.

Mary threw herself, sobbing, on her sofa. The boys danced and sang and shrieked and hugged each other until they too wept.

'Well played, old girl!' shouted the close-

cropped boy.
'Votes for women! Votes for women!' shrieked the he-fiend with crimson hair.

Even the professors laughed incontinently. The trees shook, and the wind subsided with a titter

But William Phillips did not even smile. He tore off his cambric shackle roughly, held it a moment in horrible embarrassment, swore at it and at the boys impartially; then, in absolute perplexity of embarrassment, stuffed it into a pocket of his coat, and strode awkwardly across the field, out and away.

Mary Field dressed and went down to her modest dinner more thoroughly frightened than she had ever been in all her life. What if her landladies—she had two, like herself spinsters—

heard? They were so very particular. They would turn her out. She had had to give unquestionable references to them. And she was so very comfortable. It would break her heart to leave Vincent Square. Yet, even for her own sake, she must go far, far away. She was disgraced. Would it get into the papers? Why not? Even be illustrated on the front page of one of the ha'penny dailies perhaps! And her name was on it, 'M. Field,' in bright red, plain-as-print lettering. It would be traced to her. Her shame would find her out—publicly.

But it did not. And she did not leave Vincent Square. After a few weeks she even grew calm again. But for a long time she wore a veil, a thick veil, and crept in and out of her lodging-house like a thief in the night, dashing stealthily in and out of Stanford Street, and never strolling, as she had loved to do, around the square.

William Phillips recovered sooner. But for some hours he was a very angry man indeed. A man resents being made ridiculous far more bitterly than any woman can. Possibly the male of our species is prouder than the female. Indisputably most men have a sense of humour and most women lack it. A sense of humour is a blessed gift, but it capacitates one for a good deal of suffering. Mr Phillips realised keenly just how ridiculous he had been made. Miss Field did not realise that she had been made ridiculous at all. She merely felt disgraced, and disgrace has not so sharp a tooth as has ridicule. She was distressed to have lost her 'maiden strewments' and her best petticoat. Her blood curdled when she remembered that, in the high glare of the July afternoon, she had stood, dishevelled, night-robed, in full view of that thickly manned playing-field. And when she thought of that red identifying Cash name she wept anew.

Phillips, chastened by dinner, fortified by wine, locked his sitting-room door and spread out on his table the truant garment. He studied it curiously. To his ignorant eyes it looked a thing of price. Miss Field had paid nearly a pound for it, but to this unaccustomed man it seemed to represent several times that sum. The red label caught his eye—'M. Field.' He dropped the garment hastily and sank into a

chair.

Would it seem far-fetched to recount how in the years long gone William Phillips and Ralph Field had been chums at Westminster School, and how as boy and girl William and Mary had loved? Such pat coincidences are of constant occurrence in life. But no such thing can be told here. Mary had loved her brother's chum, and for that memory, as well as for other memories, Vincent Square was dear to her; but his name was Joseph Burton, and he had married her best friend long ago. Phillips had never been a Westminster boy. He had never loved; and the only time he had thought he had, the

object of his fancy had been a flaxen Gretchen in his Stuttgart student-days. Why had 'M. Field' neatly stitched in red upon the petticoat's band so moved him? Because—and had it been in full 'Mary Field' it would have moved him more—his stepmother, a particularly objectionable specimen of that pseudo-relative, had been, when a spinster, a Mary Field. He disliked the name Mary excessively. He felt sure that the garment had blown from one of the houses on the west side of Vincent Square, and he wondered what he ought to do about returning it. It was marked plainly enough, in all conscience. He wished he knew where such namemarks were to be bought. Such a label ought to curb the phenomenal disappearance in the wash of his shirts and hose. Beyond question this petticoat belonged to 'M. Field,' a woman living on the west side of Vincent Square. find her should not prove difficult. To return her property would be but primitive honesty. But just how? He felt sorry for her, in spite of her name, now that his anger had cooled. He had seen her clearly at the window. He recalled her now as not unattractive, as she had stood bathed in sunlight and clad in white. Assuredly she must have the thing back, but he must think of the way that would mortify her least. Perhaps it would be kinder to burn it, and let the poor woman think that the name had never been seen, the owner never traced. He folded it up cautiously as one might handle a snake, and put it at the bottom of his winter underclothing drawer.

An Irish housemaid laughed herself ill next day; and a landlady, who had for years cherished perfectly futile designs upon her most eligible lodger, wept in rage and chagrin, and very nearly

gave the Egyptologist notice.

Perhaps that petticoat lay on the knees of the gods the while it lay in innocent impropriety upon the bosom of William Phillips's thickest flannels. For three weeks later the Egyptologist, impatient at the deterioration (as a typist) of a young woman in Holborn who had recently become engaged, hunted for a new typist, and chanced upon Mary's office. He did not recognise her, though he thought her face both sweet and familiar. What he did recognise, and admire, was the excellence of her work. He suddenly needed a good deal of typewriting done; and, mistrusting the postal service perhaps, he usually carried his work back and forth himself.

It was when she receipted a bill and wrote her own name beneath the firm's signature-stamp that he knew why her face had seemed familiar.

He had not yet made up his mind how to return the nomad petticoat. Now it was out of the question that he should do so at all. And yet he did, but not until they had been married a year. Even then he wondered how she would take it. But a wife is of a metal very different

from that of a spinster of social isolation. Mrs Phillips giggled. And when, emboldened by her mirth, he ventured on an impertinent joke, saying, 'I believe that you did it on purpose!'

she laughed still more. For they were growing young astonishingly, these two together, who apart had been for years deeply occupied in growing old. So wonderful is marriage!

FORT ON THE GUINEA COAST.

By C. H. P. LAMOND.

THE fort is perched upon a rock above the bay, and dates from the sixteenth century, having long been occupied by the Dutch, those great traders following in the footsteps of the Portuguese. But little now remains to indicate its former makers, who probably removed their records when the country passed by treaty to the British, or they may have perished by the natural decay which so quickly falls upon everything from Europe. In the yard, however, now used for the prison, there is the grave of an old Dutch commandant, with his name and the date 1656. Within the last year or so a curious incident occurred. An explosion took place in the grave, which cracked the headstone; but, like the scientific gentleman in *Pickwick*, I know not to what natural causes to attribute the phenomenon.

The fort, in common with all others on the Gold Coast, was built for security rather than for comfort; and for natives to attack it successfully, either by land or sea, must have been impossible, even if armed with the artillery of the past, which of course they did not possess. At present the fort contains several of the Government offices, two sets of quarters, and the prison. The Gold Coast prisoner must surely be the most tractable in the world, since the numerous opportunities for escape are seldom taken advantage of. In my time a prisoner did, however, escape from this very fort, apparently by climbing over the outer battlement in a corner of the yard. In the course of his inquiry the Commissioner of the District inspected the alleged locus in quo, paraded the prisoners, and offered any man a shilling on his release who could climb out that way in the Commissioner's presence. Only two prisoners accepted this offer, and made a few halfhearted attempts, being restrained by the gestures of their fellows behind the Commissioner's back. The yard was, of course, made more secure after this event.

Until recently the fort also served as the signal station. At every station on the Coast a timegun is fired at eleven A.M., whereupon work ceases with great punctuality till one o'clock, when the offices re-open. The gun also announces the approach of ships to the roadstead, and upon Coronation Day we had a royal salute of twentyone guns. The fact, however, that there was only one gun in use caused a longish interval between the reports, so that people supposed that a whole fleet of ships was being sighted, one after the other.

Out in the bay, half a mile from the fort, is the Fetich Island, so called from the religious practices of the natives there celebrated. When the Government acquired the island for the new signal station, it was with reluctance that the signalman entered upon his duties at this spirit-haunted place. The island affords fair green pigeon shooting in the early morning and evening.

Under the fort the native town and the bungalows of the Europeans have grown up side by side; it is only lately that the medical theory of segregation for the two races has had practical results, and the problem is rendered more difficult by the reluctance of the native to change his home, even when a better site is provided for him.

But the future of the country takes but little count of its past, those old days of lawless slaveraiding and destruction, to which the forts of several nations along the littoral bear witness, with their melancholy dungeons and rusty ordnance. Civilisation of a sort has touched the Gold Coast for centuries; it has introduced missionaries, it has introduced gin, and on the latter there follows a deterioration of the native. What he thinks about it all who can tell? We are strangers among a shy and secretive people. But yet we trust that somehow good will be the final goal of ill; and if the white man, looking back and around, sees indications of mistakes in his dealing with coloured races, it is with satisfaction that he remembers that it is to the white man's justice and fair-play that the black man looks, and we trust looks not in vain.

WHEN MORNING BREAKS.

WHEN morning breaks, and the earth awakes, And each flower and each tree Awakes from rest, in the bright dew drest, Then I long for thee.
The crimson skies, when the daylight dies, Bring fair visions to me;

The twilight hour, with its mystic power, Makes me think of thee.

O'er earthly things when Night spreads her wings

I bend then, dear, my knee,
The God of Love, in His heaven above,
Hears my prayer for thee.
Though sleep may reign, and the senses chain,
Yet the fancy is free,
Sleep hath no art to control the heart,
So I dream of thee.

LUDOVIC LITHGOW.

SEVENTEEN YEARS AMONGST QUEENSLAND BLACKS. By E. B. Kennedy.

PART I.

IF readers of this narrative take a map of Northern Queensland, and find Cape Bowling Green, in latitude 19° 20' south, where James Murrells was wrecked, it will assist them in tracing his wanderings amongst the wild tribes with whom he lived for seventeen years, and who always treated him with kindness.

The account is unique, and as I heard portions of it from his own lips it may be accepted as true. Murrells gave me the booklet—written by Mr E. Gregory at his dictation—from which

I now give his history.

I was serving in the Black Police of Queensland in 1864 when I met Murrells at Port Denison, since known as Bowen. This was after our return from a patrol which extended from Mount Elliott—a great hill which overlooks the mouths of the Burdekin—to Cape Bowling Green and Cleveland Bay. Turning from the coast at the latter spot, we proceeded westerly to the watershed of the Burdekin River, and so home to our snug bark-roofed barracks on the Don, situated not far from Port Denison.

These extensive districts comprised Murrells's wanderings, so that I learnt much of interest in conversing with him. He was shy at first, and could not always express himself clearly, having lost much of the English tongue. I now

turn to the narrative in the booklet.

James Murrells was born in the parish of Heybridge, Essex, in 1824. After seventeen years of bush-life he had almost forgotten his own name; though he told me that he would sometimes sit for hours in the bush trying to trace his name on his knee or write it on the sand, and read it to his black companions, to their great amusement.

His father was an engineer and wheelwright, and carried on business in Swan Yard in connection with a relative named James Hayes. When the lad was about fourteen years old, a pilot named Firman, who piloted craft down the Blackwater, used to take Jimmy with him. The novelty of these trips and the yarns and songs of the sailors made so powerful an impression on him that he constantly expressed a desire to become a sailor. His parents frequently told him of the troubles of a sea-life, but he was nothing daunted. On one of these occasions the captain asked the

pilot if he should take the lad with him there and then. Jimmy was consulted, and readily agreed to go; and thus, without further reference to his parents, he went on his first voyage in the brig Royal Sailor, belonging to the Maldon Shipping Company. The captain was a very pious man, and a Wesleyan. Every night at eight o'clock, weather permitting, he called all hands together and read the Bible to them and conducted a religious service. Everything went on well during that voyage, and the lad's ardour for a sailor's life increased. He made many short and long voyages; and at length he left home for the last time, arriving in Sydney on the 24th February 1846, and shipped on board the ill-fated vessel Peruvian, Captain George Pitkethly.

We continue the narrative in his own words: 'Having been only a few days out, in the neighbourhood of Horse Shoe Reef, and encountering bad weather, we struck with great force on rocks, and at length we were lifted by the seas to the top of them. The sea then swept one of the boats and the second mate overboard. At daylight a terrible scene presented itself; as far as the eye could reach there were the points of the rocks awash, but no friendly land in view. The captain ordered the jollyboat to be got over the side; but she was stove to pieces in the broken water. We now had only the long-boat left, which was old and shaky; and the spray and broken water filled her as she hung in the tackle. The captain ordered some hands into her to bale her out, but it was so unsafe that none would risk their lives in her except the first mate, who was the captain's brother. Before he had got out a couple of bucketfuls the stern-post was jerked out of her, when she broke adrift, and was carried away by the force of the current. Lines were thrown out, but none reached her. The mate sat calmly in the bows of the boat, and bade good-bye to his brother and sister, and awaited the will of God. Presently he disappeared from sight.

Our position being now apparently hopeless, the captain called us into the cabin, where we engaged in religious exercises, and commended ourselves to God in prayer. We then contrived

No. 180.-Vol. IV.

MAY 9, 1914.

to make a raft with masts and spars, and with great labour managed to get it off the ship's quarter on to the rock and then into the water. All the bread and nearly all the preserved meat had been washed away, and only a small keg could be found to hold water. All the provisions we could muster were a few tins of meat, the small keg of water, and a little brandy. During the night the force of the current caused the raft to part her mooring, and we were carried to sea. On the raft were three ladies, two children, two gentlemen passengers, the captain, the crew, and stowaways, in all twenty-one souls.

'All went on as well as could be expected for twenty-two days; at first we caught a few birds, drank their blood, and their raw flesh was eaten with gusto. The weather was fine

throughout.

'On the twenty-second day out the first death occurred, a man named James Murray. was stripped and thrown overboard, and the sharks devoured him instantly. We caught a couple of rock cod. It then rained, and we managed to get a few drops of water after the salt had been washed out of the sail. The infant child of Mrs Wilmot was the next to succumb, then the other little girl, and next Mrs Wilmot herself. Her husband then took off what clothing she had on, which was only a night-dress, and threw her into the sea. At this time the castaways dropped off one by one very rapidly, and the burial service was read over each; but I was so exhausted that I forget their names.

'We next began to think how we should obtain food. Our only fishing-line had been carried away. There were plenty of sharks about, and the captain devised a plan to snare them with a running bow-knot, as follows: We cut off the leg of one of the men who died, and lashed it at the end of the oar for a bait, and on the end of the other oar we put the snare so that the fish must come through that to get at the bait. Presently one came, which we captured, and killed with the carpenter's axe, and made a fine meal off him. We caught more in the same way, which we cut into strips and dried. Shortly after this we made the Barrier Reef, and two days later came in sight of land, which appears to have been Cape Upstart. Two or three days later the sea-breeze drove us inshore once more, and eventually about midnight we landed on the southern point of Cape Cleveland. There we lay down on the sand and went to sleep. Presently it came on rain, and we filled our tins from the holes in the rocks. Whilst on the raft the captain had cut a notch in a piece of wood every day, and on counting them there were forty-two. Of the twentyone who left the wreck alive only seven had survived.

'In the morning, when the sun arose, we

washed and dried a piece of white rag, took a magnifying-glass out of the spyglass, made a fire, and boiled some dried shark's flesh, which, with a drink of clear fresh water, made an excellent breakfast.

'At low water the captain, being the strongest, sallied forth in quest of food, and shortly afterwards returned, bringing rock oysters, which were very plentiful, sticking in great clusters to the rocks, and, like limpets, required no opening. Some of us crawled about and got a few; but three of my mates were so exhausted that they died.

'After we had been fourteen days on shore we were seen by some of the natives. It appeared that for several nights they had observed falling stars in one particular direction—the direction of the rocks on which we were.

'When I returned in the evening the captain's wife said she had heard the natives jabbering; and ten minutes later, after the captain came home, she heard the noises again. Jumping up, she went outside, and looked up on the rocks, and there, sure enough, were a number of the naked black-fellows. "Oh George, we have come to our last now!" she exclaimed.

'At first the blacks were as afraid of us as we were of them. Presently we held up our hands in supplication for help. Some of them returned the salutation, and after a while came among us and felt us all over from head to foot. They satisfied themselves we were human beings, and, hearing us talk, asked by signs where we had come from. We pointed across the sea; and, seeing how thin and emaciated we were, they took pity on us, and asked us, as well as we could understand, where we were going to sleep, as it was getting dark. We showed them the place in the rock. They came in with us, and we were going to give them some of our things; but while we were talking others had been in and relieved us of everything.

'Eventually about ten of the old men came into the cave we had made our camping-place, to sleep with us, and separated us by lying between us. They kept up a constant jabber among themselves, which led to a second and more minute examination of our persons to ascertain our sex, which seemed necessary to them because we wore clothing. The captain's wife strongly resisted this; but they persisted, and when they found that, like themselves, we were male and female they were satisfied, and did not further

trouble us.

'Next morning there was a great discussion amongst the blacks as to what should be done with us. There were representatives of two different tribes. The boy and myself were claimed by one tribe, whose permanent campingplace was about Mount Elliott; and the captain and his wife were similarly claimed by the tribes belonging to Cape Cleveland.

'Then they commenced to strip us; but,

pointing to the sun, we showed it would kill us if we were naked; so they allowed us to retain our clothes. They gave us small roots to eat, which we enjoyed very much; they also pointed to the bush to tell us if we came with them they would give us plenty to eat and drink. Signifying our intention to go with them, they were very glad, and wanted us to join with them in a corroboree; but, as we could not, we thought we should please them by singing a hymn. I accordingly gave out the words of a hymn I knew, beginning:

God moves in a mysterious way His wonders to perform,

which we sang to the end, and which amazed them very much.

'We soon began to make preparations to move off toward the camp. Seeing the boy was unable to walk, one of them picked him up and put him on his shoulders, with his legs hanging down, just as they carry their children. Their camp was on the edge of a plain, where they had made a small fire, and when we came up we saw men sitting around it. We recognised them as strangers, powerful men, who seemed to be sitting in state, as they did not move. Great fear seized hold of me, and when they came to lead me up I thought I was to be cooked and eaten; but seeing the fire was so small, and not observing any weapons, I suffered myself to be led up. They looked at me, and observing me shake with fear, warmed their hands at the fire and put them on my face and all over my body to reassure me; at which I took heart again.

'Meanwhile some were sent on ahead to the camp to have plenty for us to eat, and to prepare for a grand corroboree. We were examined by fifty or sixty men, women, and children. At first they scampered off in all directions, as the sight of white people wearing clothes produced a panic. After their curiosity had somewhat subsided they led us to a gunyah, and gave us abundance to eat and drink. For eight evenings successively representatives from the more distant tribes came in to see the wonderful people. They would not allow us to go out and get food while we were so weak, but gathered sufficient for all our wants.

'As we got stronger we spent our time in wandering about with the blacks on their fishing excursions and in learning to snare ducks, wild turkeys, and other wildfowl, in which after a while I became much more expert than the natives themselves, because I took more care in making strong string for the nooses and in choosing the exact places to set them; also, being a sailor, I was able to make better knots than they did. This made them very strongly attached to me.

'Time went on, and strange natives began to collect in large numbers. When they had all

arrived they numbered considerably over a thousand, a larger number than I have ever seen since. They belonged to about ten different tribes. We learned that some of the tribes belonged to the country far south of where we were, which determined us if possible to go away with them when they returned, and so perhaps reach some white settlement.

'They had a grand corroboree which lasted three days, and went through the rites and ceremonies of the "boree." After it was all over we stole away and went with the tribe that was going south. We got distributed, one to one tribe, and one to another. The tribe I was in was located on the present site of Port Denison. Nearly two years after we had been living with them we heard that the boy was dead, and that they had burnt his remains, as they do with the remains of their own dead. Then we heard that the captain sickened and died; the death of the boy, I believe, preyed on his mind, and also the degraded state of his wife, for up to this time she had managed with great difficulty to keep herself partially covered. It was too much for him, and he sank under it. The sight was also too much for me when I saw her, and it almost broke my heart. I was forced to leave, and go on a hunting and fishing expedition to divert my mind from the painful feeling of isolation and despair of ever being restored to civilisation.

'Being in a strange tribe I felt lonely, and determined to go back to the tribe that claimed me as its own. After several months I reached it, and they were all very glad to see me.

'Shortly after this, while I was on Mount Elliott looking for honey and bread-fruit (which was not quite ripe), a report was brought to me that a vessel was seen on the coast of Cape Cleveland, where our raft had landed. A little later another vessel was seen, and I was told that the men from the vessel went on the rocks, looked through a glass, and brought the sun down to the water. I had previously told the natives, if ever they saw a white man again, to try and make him understand that there was a white man living there with them. On this occasion they remembered my wish, and tried their hardest, but seem to have failed, as the white men became alarmed, thinking they meant mischief, whereas it was only their earnestness in trying to make themselves understood.

'The report of the proceedings of the Government schooner Spitfire, in 1860, mentions that, upon landing, the natives suddenly made an attack, which was instantly repulsed. Then, shrieking and yelling most diabolically, the blacks retired to the beaches and hills.'

Murrells added this to the shortened account:

'Nothing is said in the report about shooting the natives; but one raw-boned, stout, ablebodied black-fellow, a friend of mine, was shot dead by some one in the boat, and another was

wounded. The hideous yelling was the noise

they usually make over their dead.'

About three years ago I was informed by the blacks of a distant tribe that a white man had been seen with two horses. Some of the tribe were lamenting the death of an old man; and while they were doing so this white man fired in among them and shot the son of the old man, who was lying on his father's dead body. The rest ran away; but eventually the blacks pretended to make friends with the white man, and got him off the horse. Then, by a preconcerted signal, they massacred him, and tried to kill the horses also, thinking they could speak and do mischief, as the man had done, but the animals escaped.

'Mr P. Somers of Port Denison told me the white man was probably a Mr Humphrey, who was out in search of runs. After this, four stray cattle were seen in our district; but I was on the coast with one of the blacks, making a 'possumskin rug. When I came back they showed me the tracks of the cattle. When I questioned them they said three of the animals had teats and one had none; thus they must have been three cows and a bull. I told the blacks these were what white men eat, and they chaffed me about their great size, long tails, big ears, and horns.

'These reports made me feel uneasy, and I began to think that civilised life was drawing nearer. Soon afterwards it was reported in the

camp that a lot of white and black men on horse-back were near Cape Upstart, shooting down the tribe I had been living with when the captain died at Port Denison. They explained to me about the saddles, bridles, guns, smoke, and the noise made by the guns when fired. I explained it all to them, to their great surprise.

'On hearing this I travelled south to the Burdekin River (or Pall Mall, the native name), thinking my chances would be greater on the river than at Mount Elliott, fifty miles farther inland. My tribe kept coming backward and forward, and they asked me why I did not come back, as I had lived with them so long. I told them I wanted to see the white men for myself. Shortly afterwards I heard of the cattle being on the river in great numbers, and of a man being on horseback with a stock-whip, which he cracked. The natives thought it was a gun, and, becoming quite frightened, they swarmed up the trees.

quite frightened, they swarmed up the trees.

'Next I heard that about fifteen black-fellows of a fishing-party belonging to the tribe I was then living with were shot down. I told them it only served them right, as showing me where the white men were might be the means of saving their lives. They said it was true, and agreed to go upon a hunting expedition on a hill called by the natives Yamarama, which was half a mile from the station called Jarvisfield, which I was soon to reach.'

A KNIGHT ON WHEELS.

CHAPTER XX.—continued.

ш

PHILIP received a scalding cup of tea from his hostess, and lowered himself timidly on to a seat beside her.

'I am so glad to make your acquaintance, Mr Meldrum,' said Lady Rendle. 'I have heard so much of you from my boy. One likes to meet some one one knows takes an interest in one's belongings, doesn't one?'

Philip, painfully unravelling this sentence, suddenly caught his hostess's eye, and realised

that an answer was expected of him.

'Yes,' he said, sforzando. 'Oh yes! One does.' Graciously directed to help himself to something to eat, he dipped blindly into the nearest dish, with the result that he immediately found himself the proprietor of a bulky corrugated tube of French pastry, with cream protruding from either end. He surveyed it miserably, wondering dimly if it would be possible to restore it without attracting attention. He was frustrated by Lady Rendle.

'I like to see a young man,' she said approvingly, 'who is not afraid of tea and sweet cakes. There are far too many of them nowadays who consider it beneath their dignity to take tea at

all. Caviare sandwiches and whisky-and-soda are all they will condescend to. And now,' she added briskly, 'I want to introduce you to a charming girl.'

The quaking Philip, with his bilious burden, was conducted across the room and presented to a pretty girl in a hat which for the time being deprived its wearer of the use of one eye.

'This is Mr Meldrum, Barbara dear,' announced

Lady Rendle.—'Miss Duncombe.'

Philip, still bitterly ashamed of his tea, achieved a lop-sided bow, and Lady Rendle departed to her own place. Timothy, who had been engaging Miss Duncombe in animated conversation, supplemented the introduction with a few explanatory comments.

'Babs, old thing,' he announced to the damsel, rising to give his seat to Philip, 'you must be gentle with my friend Theophilus. He is fierce if roused, and should on no account be irritated while having his tea; but when properly handled will be found perfectly tractable. He is not married.'

'Tim,' replied Miss Duncombe, 'I hate you! Go away!'

'By all means,' said the unruffled Timothy.
'See you at the Venners' dance on Thursday.
Keep me all the odd numbers up to supper, and everything after, will you?'

'No,' said Miss Babs.

'Thanks awfully,' replied Timothy gratefully.

'So long!'

He departed, leaving Philip alone with the girl. He regarded her covertly. Miss Babs Duncombe was a fair sample of the *ingénue* of the present day. She was exquisitely pretty, beautifully dressed; her complexion had been supplemented by art; and her tongue spoke a strange language.

'Tim is rather a little pet, isn't he?' she

observed to Philip.

Philip, who had been blinking nervously at Miss Babs' sheeny silken insteps, looked up. 'He is a great friend of mine,' he said; 'but I am afraid I have never regarded him as a pet.'

'I see you are a literal person,' observed Miss Duncombe. 'I must be careful. What shall we talk about? What interests you?'

Philip pondered. 'Machinery,' he said at

'How pathetic!' was the response of Babs. 'What else? Do you tango?'

'No.'

'Do you skate?'

'Yes.'

'I have never seen you at Prince's.'

'I have never been there,' confessed Philip, feeling very much ashamed of himself.

'How tragic! Where do you go? Is there

another place?'

'I skate—whenever there is a frost,' said

Philip. 'I am rather bucolic.'

- 'Oh, you mean on ponds, and that sort of thing,' said Miss Duncombe gently. 'You shouldn't, you know. It's not done now. Are you very fond of exercise?'
 - 'I take all I can.'
 - 'So do I. I adore it. Do you hunt?'
 - 'Once in a way.'
 - 'Polo?'
 - 'No.'
- 'You are a monosyllabic man! What do you go in for?'

'Rugby football.'

Miss Duncombe shivered elegantly. 'How very quaint—and how squudgy!' she said. 'I am afraid you are a cave man.'

'What is that?'

'Some other girls and I,' explained Miss Babs, 'have a sort of little society of our own, called The Idealists. Our séances are simply too thrilling. We sit on cushions round the floor, and smoke Russian cigarettes, and drink the most divine liqueurs—pink or green or gold—and have the duckiest little debates.'

Philip, dumbly gripping the tube of French pastry, gaped quite frankly. This eccentric young female was an entirely new type to him.

'What do you debate about?' he asked respectfully, sipping his tea, which by this time was stone cold.

'Oh,' said Miss Babs vaguely, 'subconscious influences, and soul-harmonies, and things like that. We divide men and women into various classes. Men like you are Cave Men. Most of the cave men I know are soldiers. Then there are Soul Men—actors and musicians. Then creatures who do nothing but crawl about in beautiful clothes are Thing Men. Men with shiny faces and hot hands are Butter Men. We divide women differently. Most of them are Impossibles, but there are a good many All-Buts. Life is so varied! The human soul, with all its infinite shades of colour'—

Philip, quite intoxicated by the exotic atmosphere in which he found himself, bit heavily and incautiously into the roll of pastry. Straightway from either end there sprang a long and sinuous jet of clotted cream. The rearmost section shot violently down his own throat, nearly choking him; that in front descended upon the inlaid parquet floor in a tubular cascade, where it formed an untidy and conspicuous anthill.

In a moment one of Miss Duncombe's daintily shod feet slid forward, her skimpy skirt forming a promontory which effectually hid the disaster from the eyes of others, especially Lady Rendle.

'Mop it up quickly,' she said in an excited whisper. 'Take your handkerchief—anything! No one will see.' She spoke breathlessly, with all the zeal of a faithful sister screening a delinquent small brother from the wrath to come. Philip, as he bent confusedly down to clear up the mess, recognised with genuine pleasure that for all her soulfulness and pose Miss Babs Duncombe was nothing more, after all, than a jolly little schoolgirl suffering from a bad attack of adolescence.

'That was the sweetest thing that ever happened,' said Babs, after all traces of havoc had been obliterated. 'If you could have seen yourself when the cream squirted out of the end! I must tell the Idealists about it at the next séance. Now, I must not laugh any more, or I shall get a purple face. Tell me, is my nose shiny?'

She submitted her peach-like countenance to Philip's embarrassed inspection.

'It looks all right,' he said.

'I don't believe you,' said Miss Duncombe, and extracted a small mirror from a gold bag. She viewed herself with a gasp of dismay. 'How can you say such a thing?' she exclaimed indignantly. Swiftly she produced a powderpuff, and proceeded to repair the ravages caused by excessive mirth in a warm room. The unsophisticated Philip gazed at her, speechless, and was still gazing when he was whirled away by his indefatigable hostess—Lady Rendle believed in keeping her male callers circulating, it enabled

those whose conversational stock-in-trade was scanty to indulge in the luxury of repetition—to the side of one Sheila Garvey.

Miss Garvey began at once, 'Do you play

cricket at all?

Yes, Philip went to Lord's.

'And I hope you are Middlesex !'

Yes. On consideration, Philip was Middlesex. 'My fiancé plays for Middlesex,' mentioned

Miss Garvey carelessly.

Philip, secretly blessing the unknown cricketer, said eagerly, 'I should like to hear about him, implying that the rest of Middlesex did not matter. After that he enjoyed a welcome rest. By occasionally supplying such fuel as 'What did he do against the Australians in the fourth Test Match?' or, 'What does he think about the off-theory?' he maintained a full head of steam on Miss Garvey for something like twenty minutes. He sat thankfully listening and watching the clock, secure in the knowledge that time was slipping away, and that Timothy had promised that their call should not extend beyond half-past five. 'Another five minutes and we are out of the wood,' he said to himself.

But he was wrong. He had just accompanied Miss Garvey (chaperoned of course by the fiance) step by step, match by match, through an entire cricket-tour in the Antipodes, including five Test Matches (with a special excursion up-country in order to see the fiance score a century against

Twenty-two of Woolloomoolloo), when his hostess once more intervened with the inevitable sentence, 'Mr Meldrum, I want to introduce you to a charming girl.'

Once more, with leaden footsteps, Philip crossed the room. Timothy apparently had forgotten all about both him and the time. despairing glance in his direction revealed him ensconced in a window seat with Miss Babs Duncombe. In that fastness he remained for another forty minutes. When at length, restored to a sense of duty by the departure of Miss Duncombe and his introduction to a grim young woman interested in Foreign Missions, Master Timothy set out to reclaim his long-lost friend, Philip had passed through the hands, seriatim, of a damsel who had be sought him to obtain for her autograph-book the signature of a certain music-hall comedian (mainly noted for an alcoholic repertoire and a deplorable wardrobe) whom she affirmed she 'dearly loved;' another who endeavoured to convert him to the worship of Debussy, not desisting until she discovered that Philip imagined Debussy to be a French wateringplace; and a third, whose title to fame appeared to be founded upon the fact that she had once bitten a policeman in order to demonstrate her fitness to exercise the parliamentary franchise.

'Now we will go to the club and drink deep,' said Timothy, as they turned out of Lowndes Square. 'You haven't thanked me yet, oh

brother, for your P.S.A.'

Philip eased his collar. 'Timothy, my son,' he observed, 'I fear I must give up all thoughts of becoming a social success. I am a Cave Man.'

(Continued on page 371.)

SELF-DEFENCE IN THE HUMAN BODY.

By Dr Charles D. Musgrove, Author of Nervous Breakdowns, &c.

NE of the most extraordinary features of accident assurance is the relatively small number of claims. It seems all the more remarkable when we consider the recurring risks which people run every day of their lives. It is only when we ponder the matter that we realise how many narrow escapes we have had. We go about our work or play, busy and preoccupied, up and down stairs, round corners, and through the midst of traffic, and yet it is seldom that an accident happens to us. We almost tripped on the stairs, nearly ran into some obstacle at the corner, all but got run over by a motor-car, and the whole time we were thinking of other things, only managing to dodge the various hazards just in the nick of time.

Occasionally it dawns upon us that we have had a hair's-breadth escape, but a thousand times we are oblivious of the fact. We realise neither the danger nor the escape. In that very fact our safety lies; for if we were conscious of all

the perils that beset us, and if it were left to our judgment to avoid them, there is little doubt that but few of us would live to grow up. By the time we had made up our minds what to do, the disaster would have taken place. A man is lighting a lamp, when it suddenly explodes, and a scorching tongue of flame shoots out straight toward his face. At the same instant he shuts his eyes and jerks back his head, and so escapes injury. He has made these movements actually before he has had time to realise his danger. Had the matter been left to his will, the flame would have reached him, and he might have sustained serious damage to his eyesight; for the impression would have had to travel from his eye to the visual centres in his brain, and thence to the conscious part of that organ, causing him to apprehend his danger and estimate the best and quickest way of dealing with it. After that a command would have had to pass to his motor centres, and from them to the muscles necessary for the movements of the eyelids and neck. This method would have been too long, and by the time the current had traversed it the psychological moment would have gone by. So nature, by way of saving valuable time and minimising risk, has devised a speedier method. The portion of the brain governing the muscles works automatically, the conscious part of the affair—the man's observation, judgment, and will—is left out, and so is achieved in the twinkling of an eye what would otherwise have taken an

appreciably longer time. Actions such as these are called reflex or automatic, and few people realise that an overwhelming proportion of the movements they go through every day and hour of their lives come under this heading. The chief part of life's experience consists in learning to do things automatically which at first are accomplished only by an effort. A baby staggers across a room, its little mind intent on its own endeavour; two years later the same child walks without thinking about it. Most of us have forgotten the days when we learned to walk, but we all remember those in which we learned to ride a bicycle. It appeared an easy matter after watching experts, but on trying it for ourselves it seemed at first an impossible thing ever to acquire the necessary balance. A vast amount of concentration was required, and the whole business seemed to be hopelessly complex. Even when the balance was gained, there was the steering to be attended to; and meanwhile the learner must not forget to keep on pedalling. Yet in a surprisingly short space of time the pupil became expert, and found himself doing all these things without giving them a thought, even chatting to a fellow-rider and looking about him in the most casual manner. The movements which had needed so much attention at first became practically unconscious. The rider could now turn corners without being aware that he had moved the handle-bars or changed the poise of his body. He soon learned to do something else too in an automatic manner, something more important than the mere act of riding. As he is going along he suddenly swerves, and it is not until he has done so that he consciously sees the obstacle which he has by this means avoided. His thoughts had been elsewhere, though his eyes were fixed on the road, and it was apart from any exercise of his own will that his arms had instinctively turned the steering-handle and his body had bent over in the right direction. Another time, as he is going round a sharp bend, he puts on the brake, and for the moment may almost wonder why he has done so until he perceives a trench in the road in front of him. Had the matter depended on his own observation and judgment he would probably have come to grief.

These automatic actions not only save time, but they are infinitely more perfect than conscious ones ever can be. A man who can walk gracefully along a road will often strut in an ungainly manner if, as a late-comer, he has to make his way to the front of a concert hall. Every cyclist knows that in the days of his learning, when he strained his utmost to avoid obstacles, the result was that he ran into them as a rule. A child will stand erect without any thought of maintaining its balance so long as its attention is otherwise occupied; but if you tell it to stand perfectly still, the chances are that it will sway about in the effort to remain motion-These are only a few of the many automatic movements which are constantly taking If it were not for them we should place. have little time to attend to other matters. Like the learner of the bicycle, we should make little progress and get scant enjoyment out of life if we had to fix our mind on all our

However, there is another aspect vastly more important than either of these. Work and happiness are not the only elements in our existence. The body must be protected against all the hazards which are continually threatening life and limb, and it is here that automatic movements are of such supreme value. For the instinct of self-defence is ever alert, even when the individual himself is careless or preoccupied. A person who is asleep will shrink away if a hand be placed on his face, and may even do so without waking up.

It is in connection with self-defence that the saving of time is essential to the last degree, for the question is one of moments, even of fractions of a moment, we might say. The rapidity of reflex acts is proved by a machine for testing the speed of movements. Tell a man to pull his hand away as quickly as possible at a given signal, and after that make him put his hand into a hole where an animal lies hidden. This time, with the shock of surprise, he will click his arm back the moment he feels the touch of the fur, and will perform this movement in half the time that he took when doing it deliberately.

The most significant part of this arrangement is the fact that the more important an organ is the more rapid is this reflex action. Of all the senses, eyesight is the most precious, and the loss of it is irreparable. Therefore the eyelids are gifted with a speed of motion unequalled elsewhere in the body. The expression 'the twinkling of an eye' is proof that this fact has been well known for many centuries. happens not uncommonly that people suddenly blink without knowing why. The next moment they are removing a fly or a midge from their eyelashes. They had not consciously seen the insect, but they had really done so, and had instinctively closed their eyes to keep out the intruder. So instinctive is this movement that few persons can keep their eyes open if a hand other than their own is passed quickly in front of the face.

Another movement, perhaps the next most rapid in the body, is the contraction of the muscles to ward off a threatened blow. Here, again, the more vital the part the greater is the speed and the more complete the movement. An unexpected blow on the arm will cause a contraction, but not nearly to the same extent as a punch on the chest or abdomen, where the consequences would be more disastrous. In the latter case the hard pad of contracted muscle forms an effective buffer, which robs the blow of much of its sting.

The body is built, too, in such a way as to lend itself to self-defence. The heart is protected by the bony structure of the chest. The abdomen, where a kick or a blow would be more dangerous owing to the absence of ribs, is guarded by one of the strongest masses of muscle in the body. When these muscles contract they not only form a dense pad, which is a protection in itself, but also draw the abdominal wall back-

ward out of the way of harm.

The brain and spinal cord, which regulate the various movements as well as the vital processes of the human system, are guarded by bone which is of the densest nature. The configuration of the skull is a shield in itself. A blow which would smash an arm or leg bone to splinters may glance off the head with little more than a bruise or cut.

The orbits are so shaped that a direct blow on the eyeball is almost an impossibility. You have only to look at a face sideways to see how deeply the eyes lie behind the upper edge of the cheek and the lower margin of the forehead. Nothing but a pointed instrument can enter the gap and so injure the eyeball; and cases where this occur are extremely rare, for the simple reason that reflex movements again come to our aid. Whether the object is aimed at the eye, or the eye approaches the object—as when a child falls on a spike or a grown-up person jerks his head toward the end of a sharp-pointed twig—the face is instinctively turned aside, so that the cheek, the nose, or the forehead receives the cut, instead of the all-important organs of vision.

When a foreign body, such as a needle, has entered any part of the flesh, nature deals with it in such a way as to render its presence as harmless as possible. For all such objects, especially if they are sharp-pointed-which is usually the case, as otherwise they would not have penetrated the skin-tend to work outward. A needle which has become embedded in a thick mass of muscle, such as that on the abdomen or the back, will gradually make its way to the surface. One which has entered a limb will travel by degrees in the direction of the hands or feet rather than toward the trunk, where its presence would be fraught with in-

finitely more risk. In one case a needle took six years to work its way from the shoulder to the tip of the thumb, whence it was finally extracted.

The place of pain in the human economy has exercised the minds of philosophers for many years. Yet pain is man's chief source of selfdefence. A grit in the eye would probably be left until it had set up ulceration and endangered the eyesight, did not the suffering render its presence intolerable. The pain of pleurisy keeps the affected side of the chest at rest; that of peritonitis secures that quiescence which is of all things essential to the treatment of the underlying complaint. The pain of a broken bone has saved many a simple fracture from becoming compound; a jerk or a struggle would have done the mischief had not the agony of movement prevented it. Pain and rest, dissimilar and irreconcilable as they may seem at first sight, are oftentimes found to be working hand-in-hand for the welfare of the individual.

Not all involuntary actions are the result of practice, the method by which walking, running, jumping, and many others are acquired. Other movements necessary for self-preservation are inherited. If it were not so few infants would survive many days. The new-born child has not learnt to ward off blows or shrink back at the approach of danger, but it is seldom that such movements are required in the case of the helpless little beings. Yet there are certain other risks which it runs, even from the moment of birth. Mucus may collect in its throat, threatening to choke it, and likely to do so were the child not provided with reflex actions which come to its assistance. Coughing, sneezing, sucking, and swallowing are instinctive from the first. Of these, swallowing is the most remarkable. If it were not for a certain reflex movement which takes place every time we swallow, food or liquid would find its way into the larynx, seeing that they must pass over the top of this organ. The consequences of such an accident might be disastrous to the last extreme. To avoid this, the upper opening of the larynx is provided with a hinged lid, which opens to admit air at each act of respiration, and must be closed securely during each act of swallowing; and this mechanical movement is a part of our organisation as much as the action of the heart and lungs. So far from being learnt by practice, matters are so arranged that the same movements which pass the food down the throat, automatically close the lid at the same time, shutting the door against all unwelcome intruders.

Furthermore, the throat itself has the power of preventing undesirable material from getting as far as this. It is well known that some people are poisoned, more or less, by articles which are pleasant and nutritious to others. Cheese, eggs, and shellfish are examples of this, and as a rule people subject to such idiosyncrasies have a corresponding dislike to these articles; if they try to swallow them the throat instinctively closes in a spasmodic manner, and deglutition becomes almost an impossibility. Even if the distasteful food be forced down by an effort of will, the stomach has also the power of dealing with it, as it has with all other undesirables. The latter may manage to get past the outer gates and their adjacent side-turning into the larynx, and yet find themselves turned back when they reach the end of the street. It is one of our inherited modes of self-defence that poisonous matter which has reached the stomach almost invariably sets up the act of vomiting.

In all these various ways Nature is ever on her guard to protect human beings from the constantly recurring risks to which they are liable. There is, however, another phase of self-defence even more wonderful than any of those we have described, another method alongside which these others seem almost commonplace. For it is not accident alone against which provision has to be made, but an enemy whose strength lies in its very minuteness, an enemy so small that it needs a high-powered microscope to demonstrate its existence. Place a microbe or bacillus under a strong lens side by side with a speck of dust, and the latter looks like a mountain in comparison. The eye may close to keep out the smallest piece of grit, but there is no sense acute enough to detect a microbe which has found its way into the throat. That being so, it would seem at first glance as though the human system were helpless against the onset of these invisible, hidden foes. Far from it. The human body does not depend solely on the efficiency of the guards at the gates, but has the power of dealing with the enemy that has penetrated to the interior of the citadel. A germ which has succeeded in establishing itself in the tissues of the fauces has more to contend with before it can fulfil its evil designs. There are substances circulating in the blood whose function it is to render such germs inert. Were it not so, the world would be swept from end to end by ravaging epidemics. This property is known as the 'resisting power,' and it is because of it that many people escape infection, even when brought into close contact with it. Several members of a family may have influenza, while others get off scot-free simply because the latter have greater resistance. It is on this quality that human beings must rely in order to secure immunity from disease, rather than on any attempt to elude the germs, for that is an impossibility. Every one who travels by rail or mixes with other people, either in the way of work or socially, is bound to encounter microbes, such as those of fevers, tubercle, or influenza, most ubiquitous of all. Safety does not lie in giving germs a wide berth so much as in attacking them by that strange, mysterious influence with which human beings are invested, and by means of which these pernicious foes are rendered innocuous. This faculty ebbs and flows, and it may be stated that as a rule it varies with the health of the individual. It follows, therefore, that the most effective way by which people can render themselves proof against disease is by keeping the general standard of health at as high a level as possible. In this way, by an abundant supply of fresh air, a sufficiency of exercise and rest, and by discrimination in regard to diet, man can increase his own resisting power, and so aid Nature in her most amazing, most ingenious method of selfdefence.

TROOPER 13,846.

CHAPTER II.

SIDI-BEL-ABBES is divided into two towns. In the centre of the town there is the narrow, squalid portion in which the Arabs live; on the outskirts the Legion's cemetery, and the villas and bungalows occupied by the Europeans.

It was midday, a scorching hot summer day. Sidi-bel-Abbès lay beneath a golden cloud of heat which was reflected from the sand. One of the villas stood apart. It was larger than the others. At an open window a woman stood looking across the intervening space to where a company of the Legion were marching back to barracks. The men marched with a heavy, hopeless tread. They had covered forty kilomètres, and the action had become mechanical, even as their brains had become numbed.

The woman turned away and spoke to some one within the room. 'It's awful, Madge!'

she said. 'If I didn't care for Leon I should go mad, run away, or do something equally foolish.'

Her sister looked up at her quickly. 'Do you love Leon?' she asked. The simplicity of her tones denied the look upon her face.

'Of course I do.'

Three years had done much to change the two women; they had taught the elder sister many things. For nearly three years she had lived a pampered life in Paris. She was a beautiful woman, and beauty is admired in the French capital. Then, for some unaccountable reason—one which she counted as madness—Captain Marchand had accepted a commission in the Foreign Legion. She had stormed, pleaded, protested, to no avail. He was going to Sidibel-Abbès, and she must go with him.

Three months' sojourn in the city of the Legion had changed her life, and it had also changed the woman; the hardness and selfishness had begun to show themselves. There is little frivolity in Sidi-bel-Abbès, and time hung heavily on her hands. So she had sent a telegram to her sister, asking—commanding—her to come over at once.

Madge had been in Sidi-bel-Abbès thirty hours, and those thirty hours had shown her the change that had taken place in her sister.

'Yes,' said the elder, 'I still love Leon; but I think it was abominably selfish of him to bring What is there for me to do in a place me here. like this?'

'Perhaps it meant advancement for him?' suggested Madge. She was watching her sister the while; and, strange to say, her thoughts were not with Grace, but with the man whose life she herself had saved.

Madge's attention was arrested by the marching column of men. 'Are those some of the

Legion?' she asked.

'Ugh! yes!' Her sister gave a convulsive shudder. 'Horrible creatures!' she said; 'rough and coarse. I was talking to Lieutenant Villevois the other day, and he said that fully 85 per cent. of those who join are criminals fleeing from What on earth could have made Leon justice. wish to belong to such a regiment?'

'Promotion is easy.' The Foreign Legion appealed to Madge, and she had studied its

history very closely.

'Promotion! I was happy enough. What would you say, my dear child, if you were taken

away from Paris and placed here?

If Madge heard, she made no reply. The légionnaires were only a few yards away now, and the walk of one seemed strangely familiar. The very thought struck her at the time as being absurd, yet her eyes followed the man and picked him out from amongst his fellows. command rang out: 'Pas gymnastique! En avant; marchez!' The men broke into the double, and in a few seconds disappeared from view.

'What are you looking at?' asked Grace.

'I was watching the légionnaires.'

'Oh, you will see enough of them whilst you are here. It is nothing but légionnaires, légion-

naires everywhere.'

To Madge, Sidi-bel-Abbes appealed with a strange fascination, as it does to some people. The Arabs interested her, but still more the regiment that goes by numbers. She had walked through the Jardin Public to the churchyard beyond, to that part dotted with black crosses, one like the other, the last resting-place of the Legion's dead.

A légionnaire was pulling some weeds from a grave. As she passed he drew himself up. She started. At first she thought she had made a mistake; then she realised why she had recognised the légionnaire only a few days before.

'You, Dick!' she said. The truth appalled her. She recollected what she had read about the Legion, and she knew that it was true. Moreover, she knew for whom he had suffered all this.

'Yes,' answered Devereux. Three years, though it had altered him in appearance, had done little to kill his spirit.

'Why have you come here? What made you

join the Legion?'

Devereux looked at her admiringly. Like a flash there came back the last time he had seen her, and the years had changed her almost beyond recognition. She had grown a beautiful woman, with a wild, elfin beauty. He did not spare himself. 'Because I was a failure. tried to get work, and failed. There was no other way to keep my promise to you.'

'Then that day you took me out to tea?'

'I lied to you,' said Devereux bluntly.

lied to save my self-respect.'

Since the girl had grown a woman she understood. Her eyes softened. 'It was good of you to keep your promise,' she said at last.

Devereux shrugged his shoulders. 'Why are

you here!' he asked.

For a moment the girl hesitated. 'I'm staying with Grace.'

'With your sister? She is here, in Sidi-bel-Abbès?'

'Yes. She married Captain Marchand.'

After a moment Devereux smiled. 'This is a funny world, and it is very small,' he said.

'I am glad I came out now,' said Madge. hesitated for a long while before I decided. Dick, why didn't you write to me?'

'What was there to say! Besides, one does not have much to spare for stamps out of five centimes a day.'

The girl's eyes glistened. 'I understand,' she said softly.

'You always understand,' responded Devereux.

'And I shall come and see you.'
He shook his head. 'You mustn't,' he re-

sponded. 'It would not be wise for you to be seen talking to a légionnaire.'

Madge laughed. Nineteen years of life had taught her many things—amongst others, a total disregard for conventionality. 'I do not care,' 'You are an old friend. That is she replied.

enough for me.'

She pondered as she walked home that day. Should she tell Grace or not? It was not until she reached the house that she decided. There, in the drawing-room with her sister, sat Lieutenant Villevois. He was a dangerous man, and Madge realised it. She waited until she was alone with her sister. 'Grace,' she said, 'whom do you think I saw in the churchyard to-day?'

'You went to the churchyard, child? How

morbid!

Madge ignored the remark. 'Dick,' she said.

'Dick?' Her sister started. 'In Sidi-bel-Abbès? What is he doing here?'

'He has joined the Legion.'

'Dick joined the Foreign Legion?' Madame Marchand smiled.

'Why'-Madge looked at her sister and spoke slowly-'because he was ruined.'

At that moment Devereux was busy at his work. The labour apportioned to him in the last resting-place of the Legion was not arduous, inasmuch as it gave him much time for thought. He looked up suddenly as a shadow fell across his path.
'We meet under strange circumstances,' said

Captain Marchand. 'The last time'-

'Was at Lady Grosvenor's, my captain.' Devereux was studying the man before him. He was the man who had won Grace, the woman to whom he was once engaged; but he felt 'Nature is a grand dramatist.' no jealousy. Devereux struck his spade into the earth as he There was a cynical smile about his

'And why did you join the Legion! I should not have thought it was for such men as you.'

Devereux could have laughed in his face. 'Because I am a gambler,' he said. 'I gambled away my money. Now I gamble with my life for five centimes a day. That is why, my captain.

Captain Marchand walked away. There were uneasy thoughts in his mind. He realised Devereux's words to the fullest extent. Nature was a great dramatist; for proof, the fact that she had placed these two men in such proximity under such conditions.

Then Captain Marchand smiled. He had little to fear, for was he not a captain, and his whilom rival—a légionnaire?

It was a time of peace for the Legion, a time which meant much manual labour and but little excitement. It is such times which send the légionnaires mad. It was during siesta, a sweltering hot day, when even the white walls of the dormitory were burning to the touch. The men lay on the beds endeavouring to snatch a few moments' sleep and forgetfulness.

Devereux had not wasted the three years he had spent in the Legion, and he lay closely watching the man who occupied the next bed to his. He was a little Frenchman who had served in the Legion for ten years. He lay still, a vacant expression on his face; every now and then his eyes dilated, and be began talking to himself in French.

Devereux listened, and his face grew hard.

Etienne, the little Frenchman next to him, had suddenly been seized with the cafard, and was muttering threats of vengeance against some

It was a momentary temptation to Devereux, and he cast it from him. That afternoon he watched Etienne more closely. For three hours the company marched in the broiling sun across a desert that was almost red-hot to the feet.

Etienne was in the front rank. Devereux, only a few feet behind him, saw the little Frenchman suddenly draw his bayonet and spring upon the officer leading them. A second later Devereux leaped upon Etienne and bore him to the ground.

They lay there struggling, the Frenchman shricking and screaming in his madness. His eyes were wild and bloodshot, and he endeavoured to thrust his bayonet through his assailant.

Captain Marchand was the officer leading. He turned sharply round in his saddle and gave a quick command, and a dozen légionnaires sprang to Devereux's help.

The little Frenchman fought with the strength of a madman; he struggled and bit. Half-adozen men fell back, wounded by his bayonet. At last they had him bound and flung into a

Captain Marchand had stood by impassively all the while. He turned to Devereux. 'I must thank you,' he said gravely. 'You saved my life.'

Devereux shrugged his shoulders. not tell Marchand how he hated him, of what he had heard the little Frenchman say during the afternoon, and the temptation it had been.

Captain Marchand wheeled his horse round 'Marchez!' he said, and the troop continued.

That evening Devereux walked to the church-While other légionnaires spent their vard. leisure hours in the Jardin Public, he preferred to wander away by himself. Curiosity—nay, more, a desire to see Madge—led him to walk on to the bungalow where Captain Marchand lived. With a total disregard of danger, he climbed the low wall and crept through the bushes toward the windows. For a few minutes he stood watching. Through the windows of the room nearest to him he could see two figures silhouetted against the light. They were standing close together, the man's hand resting on the woman's shoulder, and suddenly he bent down and kissed her. Devereux turned sharply round. He had seen enough, for the woman was Madame Marchand, and the man Lieutenant Villevois.

(Continued on page 577.)

MEMORIES OF KILMUN.

WHEN we glance at a map of the estuary of the Clyde it is easy to understand why this district has become one of the greatest centres for shipbuilding in the world, and the nursery of steam navigation. In no part of the United Kingdom are there finer sailing routes or better steamboats to negotiate them. No one who has ever sailed into any of the sea-lochs with which the northern shore is honeycombed, or through the winding waterway of the Kyles of Bute, is likely to forget the experience. Especially pleasant is it on a sunny day, with the lush greenery clothing the shore, or when autumn tints are glowing and the purple heather crowns the hills. On the way from Glasgow, after the entrance to Gareloch and Loch Long, comes Holy Loch, which runs inland for three miles, and, though small, yields to none of the other lochs in beauty and interest. It may be most easily reached from Strone or Hunter's Quay, the centre of the Royal Clyde Yacht Club, close to Kirn and Dunoon. The other villages on Holy Loch are Sandbank and Kilmun, which suggest the subject of our article, at the centre of the north shore.

In sailing up Holy Loch, or in rounding by road the point toward Sandbank, a charming view of the rugged Argyllshire hills bounds the vision at the head of the loch. These grand hills are pierced by the valleys of Glen Lean, Glen Massan, and the picturesque road to Loch Eck. The beautiful estate of Ben More, named after the highest hill in the neighbourhood, nestles

in the foreground.

There is a tradition that the name of the loch owes its origin to a Glasgow-bound ship which was bringing a cargo of consecrated earth from the Holy Land being stranded here in Holy Loch. On the consecrated earth a church was built. The Gaelic name of Holy Loch means Charmed Loch. It is an earlier tradition that toward the close of the sixth century a Columban church was founded here by St Fintan Munnu, from Ireland, which was in lay hands in the thirteenth century. In the fifteenth century Sir Duncan Campbell of Loch Awe founded a collegiate church for a priest and six prebendaries. Its ruined tower still stands in the churchyard; and thither, from Magdalene Chapel, Cowgate, Edinburgh, was brought the headless body of the great Marquis of Argyll in 1661, and three years later the head was laid beside it. The fifth duke's duchess, known as one of the beautiful Misses Gunning, was laid here in 1790. The parish church has been restored by the late H. J. Younger of Ben More, who also presented Kilmun with a public From the churchyard the view of the opposite shore of the loch is pleasing and memorable, and embraces Sandbank, with Ard-

nadam (which has prehistoric remains), and the beautiful Hafton estate. The mildness of the climate is seen in the growth of all the wellknown forest trees, the fine evergreen shrubbery,

fuchsias, and arbutus.

The eighth Duke of Argyll, George Douglas Campbell, who was buried at Kilmun on 11th May 1900, in his autobiography recalls the funeral of his mother, which went thither in a steamer. Although only about five years of age, he noticed the engines of the steamer, so different from those of to-day. The engines worked in an open well, and the piston-rods rose high above and fell deep below the level of the decks. A small bulwark was all the protection which saved the passenger from falling on the machinery. No doubt this was one of David The duke writes: 'The Napier's steamers. burying-place at Kilmun is called a vault, but it does not at all correspond with that descrip-It is simply a part of the chancel of the old church, wholly above ground, to which access was obtained by large folding-doors. Each side of the aisle was fitted up with a broad shelf of stone, on which the coffins were deposited, and were fully exposed to view. My mother's coffin was laid near that of my grandfather, who had died in 1806. On this being done, the bearers retired, and shut behind them the folding-doors, leaving us all in a dim and gloomy light. I still recollect the panic which then seized me, and the tall, deeply craped figure of my cousin Adelaide Campbell trying to pacify my terrors by assuring me that we were not to be there long. I recollect, too, my father kneeling on the slab beside my mother's coffin, and seeing that it was carefully adjusted with reference to the position of the other mouldering remains. But my panic was little abated till I saw the folding-doors reopened, and until we emerged into the light of day, with the sea at our feet and the mountains all around.' His mother was Joan, daughter of John Glassel of Longniddry, East Lothian, and he was born at Ardencaple Castle, Dumbartonshire, in 1823. Keenly interested in science, he spent much time from boyhood to the end of his life among the islands, firths, and sea-lochs of the west of Scotland. As an orator he came next to Gladstone and Bright in the political arena.

Where no railways were possible to develop and connect Clyde coast towns and villages, their progress and prosperity have been coincident with a regular steamboat service. The phenomenal progress of Rothesay and Dunoon especially has been dependent upon this. J. Scott Russell said that from the year 1818 until about 1830 no man effected more for the improvement of steam navigation than David Napier. His influence was felt in a special manner, as we

shall see, at Kilmun and the Holy Loch. The son of John Napier, smith and founder, of Dumbarton, he was early initiated into the practice of an engineering business, as he entered his father's workshop when twelve years of age. He remembered how the machinery was kept running night and day during the war period boring cannon which had been cast at Carron or Clydebank. He had examined William Symington's Charlotte Dundas as she lay in the Forth and Clyde Canal, and realised that, with her double-stroke condensing engine and other improvements, the question of marine propulsion had been solved. His father knew Henry Bell. The boiler for Bell's Comet of 1812 was made in Napier's workshop, and paid for by a promissory note for sixty-two pounds, which was never honoured. The elder Napier died in the year following Bell's successful experiment. while the works had been removed to Glasgow, where David Napier, believing that steam navigation was likely to succeed, erected new works for making marine steam-engines. He made the engines for the Dumbarton Castle, the first passenger-steamer that sailed up Loch Fyne, and for the Britannia, the first that went to Campbeltown. These pioneer steamers suggested the idea to a Dublin company for a line between Holyhead and Howth; but the two vessels built for them at Greenock failed entirely in enginepower when exposed to the open sea. Napier felt he could do better, and in 1818 built on his own account the Rob Roy steamer for the passage between Glasgow and Belfast. She proved entirely successful, and was afterwards transferred to the Dover and Calais route, and finally sold to the French Government, and renamed Henri Quatre. Other steamers were built by Napier for the passage from Greenock to Liverpool and from Holyhead to Howth, and for the postoffice service. These were the first to establish the practicability of navigating the open sea by steam-vessels, as recorded in blue-books of the House of Commons. He built the engine for the United Kingdom (1826) for the passage from Leith to London. She was the first of the socalled successful leviathans. An explosion on board one of Napier's steamers, the Earl Grey, affected his health. He retired from the Clyde in 1836, went to London, and opened a yard at Millwall on the Thames, where his work was mainly of an experimental kind. His Eclipse, Isle of Thanet, and Rocket, built there, outsailed all other steamers on that river. When he retired to live at Worcester his yard at Millwall came into the hands of Mr Scott Russell for the building of the Great Eastern.

What David Napier did locally for steam navigation on the Clyde deserves further notice. He was at the full tide of his inventive ability, energy, and resource when he purchased for over eight thousand pounds the estate of Glenshellish, near the north end of Loch Eck, and

spent four thousand pounds on its improvement. Four well-made paddle-rings remain there as relics of his proprietorship. In 1828 he purchased from Mr Campbell of Monzie land on the north shore of Holy Loch, then in a state of nature. Later he made a further purchase which gave him control of three miles of the shore. He built the hotel and a landing-pier at Kilmun, and the six villas to the upper side of it, in the largest of which he lived for a time. He ran a line of steamers thither from the Broomielaw. In some autobiographical notes he writes: 'I also put a small steamer on Loch Eck (Aglaia), and then on Loch Fyne, and had a road made from Holy Loch to Loch Eck, on which I placed a steam-carriage (1828), thereby making a new route to Inveraray and the West Highlands. This steam-carriage was, I believe, the first that carried passengers for hire on common roads, being long before there were any public railways in either England or Scotland. But for the softness and the hilliness of the roads, and more particularly for the want of knowledge how to make a boiler, we could not obtain the speed I expected.' To-day the Loch Eck route is one of the most popular in the West Highlands. The work of David Napier was good, but scarcely so substantial as that of his cousin, Robert Napier (1791–1876), who followed in his

It is a surprise to most visitors to find the grave of Elizabeth Blackwell, M.D., in the churchyard of Kilmun, not far from the mausoleum of the Argyll family and Douglas of Glen Finnert. The inscription beneath the beautiful Celtic cross tells us she was born at Counterslip, near Bristol, on 3rd February 1821, and died at Hastings on 31st May 1910, and that she was the first lady to receive a doctor's degree, in 1849, and the first to be placed on the Medical Register of the United Kingdom, in 1859. What a lifetime of busy, beneficent effort was crowded into her span of about ninety years! There is an extract from one of her essays on the gravestone: 'It is only when we have learned to recognise that God's law for the human body is as sacred as-nay, is one with—God's law for the human soul that we shall begin to understand the religion of the heart.

Elizabeth Blackwell was the third daughter of Samuel Blackwell, a Bristol sugar-refiner, who emigrated with his seven children to New York in 1832, when she was eleven years of age. The family became sympathisers with Lloyd Garrison and other anti-slavery friends; while they read the works of Emerson, Channing, and Carlyle. When she was seventeen years of age her father died suddenly at Cincinnati, leaving his family unprovided for. A day and boarding school was started by Elizabeth and her two sisters, who became supporters of the wider movement for the education of women. In 1842 she left Cincinnati and taught successively in girls' schools in Kentucky, North Carolina, and Charleston. A

lady suffering from an incurable malady said one day to her, 'You have health and leisure; why not study medicine? If I could have been treated by a lady my worst sufferings would have been spared to me.' Although at first she was averse to the notion, the thought was seed cast in fruitful soil. She saved her small earnings for college fees, made application to eleven medical schools in vain, but was finally accepted as a pupil at Geneva College, Western State of New York. How well the professors and students behaved toward her is seen in her autobiographical notes. Punch had verses on 'Doctrix Blackwell' when she graduated in 1849. She came to England, and visited several hospitals; then she went to Paris, entered La Maternité, and had put in six months' hard work, when she contracted purulent ophthalmia from a patient, and lost the sight of one eye. This closed her career as a surgeon. She was again in New York in 1853, where, on being refused a post in the women's department of an institution, she opened one of her own. She was joined by her sister Emily, who had qualified as a doctor at Cleveland, Ohio; and Dr Sophia Jex Blake was amongst her first students. She was the first professor of hygiene in the medical school, and started, and took a leading part in, the movement for sending nurses to the front during the American Civil War. She accepted the chair of gynecology in the London School of Medicine for Women, and wrote and lectured on such subjects as the moral education of the young and how to keep people well, which was her lifelong aim, rather than to care for them after they were ill. Her intercourse with Florence Nightingale also impressed her with the supreme value of sanitation. We have not yet got beyond the need of the plain, direct teaching of her lectures on the moral education of the young, the physiology of sex, and other social and medical subjects in which her conclusions are in keeping with sound thinking and the highest morality. She left a noble example, and in this and much else has still a message for the present generation.

Elizabeth Blackwell loved the quiet beauty and health-giving air of the region round Kilmun, and had expressed the sentiment that there were just two places which she would like as her last resting-place—the Protestant cemetery at Genoa, or Kilmun. In the hotel register, under date

August 1905, we found this entry in her handwriting: 'Our fourth visit to this hotel. time the air of Kilmun seems more invigorating, and our host and hostess kinder.' And there, too, in the very rooms she occupied, we found Miss Katherine Barry, her adopted daughter and lifelong companion, established. Surrounded by the familiar books and pictures, with the dog Khaki she had known and loved, Miss Barry had still about her an atmosphere of her old Very interesting was the diploma of 1849 received by Miss Blackwell from Geneva. College, and now in the custody of Queen Margaret College, Glasgow. Miss Barry had much to do in the prompting of Dr Blackwell to write her life-story, which was published as Pioneer Work in Opening the Medical Profession for Women. It is a genuinely human document, rich in humour, with sane and high-toned views of life, and has been an inspiration to all who have read it.

Mrs Henry Fawcett, who wrote the obituary notice of Elizabeth Blackwell in the Times, and an introduction to her Pioneer Work for Women in the 'Everyman's Library' series, said: 'She was a great woman, a great pioneer, and a great example to her fellow-citizens.' The two poles of opinion regarding her work are exemplified by Charles Kingsley, who said to her, 'You are one of my heroes;' and by Fanny Kemble, who said to her in New York, 'Trust a woman as a doctor? Never!' In this Journal for 1858 there was quoted the greater portion of a sketch of Elizabeth Blackwell by her sister, Dr Emily Blackwell, who took her degree later, and who has been described as a splendid person intellectually, and a born teacher. This sketch was characterised as 'a piece of lifehistory of a most heroic and touching character.' Robert Chambers wrote later, in 1859, a generous notice of her lectures at Marylebone Literary Institute on the value of physiological and medical knowledge for women. These lectures first influenced Dr Elizabeth Garrett Anderson towards a medical career. Up to the last, when over eighty years of age, Miss Blackwell kept working at her social schemes and the purity crusades of others. Much of the best teaching of a lifetime will be found in her two volumes of reprinted papers and lectures, Essays in Medical Sociology.

SOME INHABITANTS OF JAPANESE GARDENS.

By CLIVE HOLLAND.

THERE are many other interesting things beside flowers, trees, and rocks in the gardens of Japan. Beautiful dragon-flies, butterflies, moths, fireflies, and occasional birds amongst flying things; and lizards, frogs, cicadæ, snails,

tortoises, gold and silver fish, carp, and snakes amongst those which crawl or swim.

Beautiful indeed are some of the dragon-flies which hover over the rivulets and tiny pools, the iris and the lotus ponds, of the gardens of

that far-off land. Amongst the most beautiful must be placed the tenshitombo, or emperor dragon-fly. Its iridescent wings, gleaming in the sunlight with a perfect rainbow of colouring, seem almost too large and powerful for the ghostly body of abnormal slenderness. The largest of all, it is also handsome, and is scarce. Of this type of dragon-fly the males much outnumber the females, and for that reason children, who are fond of catching them, when fortunate enough to secure a female tie a cotton or silken thread round her and attach the end to some blade of grass or twig, with the view of attracting the male dragon-flies. The ruse seldom fails, and a pair are soon in the possession of the happy children, who seldom, if ever, injure them by rough handling. Over the surface of the pools and ponds other varieties hover with apparently immovable but actually swiftly fluttering wings, beautiful as the flowers below them, and almost more fragile.

Of butterflies which haunt the gardens of towns and cities there are nearly a score of varieties. In the country gardens this number is frequently largely increased; although, of course, some kinds, as with us, are only found in particular districts. One of the commonest, as well as one of the daintiest, is a beautiful butterfly of snowy-white. Not the white we know, but a silvery shade of whiteness, so that its wings look as though cut out of the purest rice-paper.

The Japanese children love butterflies; and if the boys are by no means absolutely free—gentlemannered though they are—from a certain unconscious tendency to cruelty, which is indeed unhappily inherent in, and characteristic of, the male children of most nations, the girls are never cruel. The gentleness of the woman's soul displays itself in early years, and serves even in childhood to differentiate the sexes very markedly in this particular.

The white butterfly very commonly frequents the rape-seed plant, and when the little girls see it hovering over the na they often sing a little song which runs thus:

> Chō-chō, chō-chō, na no ah ni tomare; Na no ha ga iyenara, te, ni tomare—

which, freely translated, is an invitation to the butterfly to settle upon their little outstretched hands if it be dissatisfied with the na leaf.

The other butterflies, many of which are distinguished for beautiful colouring, are features of every garden during the warm months, and add even to a garden of stones, trees, and shrubs an element of charm which is perhaps the more marked on account of the beautiful insects' sombre environment.

The semi or cicadæ are well known to every traveller in Japan. They are insects with voices. They form a very considerable portion of the orchestra of the garden, from whose music the listening ear can extract many melodies. These

Japanese semi are more marvellous musicians than those of the tropics; they have one great advantage over the latter, that their song is much less wearying and monotonous, as there is a new kind of song with a different note for almost every month of the season during which they are heard.

There are six or seven kinds in all. The first to come and go is the natsuzemi, or the summer semi, which makes a sound of increasing shrillness, ji-ji-ii-iii-ii, till it dies away softly. Small as these semi are, three or four of them are capable of making so deafening a ji-i-i-i-ing that when they are close at hand one can scarcely hear one's self speak. Fortunately, however, the first-comer among these insect musicians is soon succeeded by the min-min-zemi, which is popularly said to chant like a Buddhist priest reciting the kyō. And although this is, of course, a fanciful exaggeration of the sound which it emits, and from which it takes its name, it is a fine 'singer,' and on hearing its voice for the first time it is impossible to believe that it is that of a mere insect.

In the early autumn, just as the gardens begin to take on some of their loveliest tints of foliage, the bell-like, tinkling sound of the pretty, greenhued semi or higurashi is heard crying kanakana-kana. Then comes the most extraordinary musician of the whole semi family, the tsukutsuku-boshi, whose music is so like the singing of a bird that foreign travellers, upon hearing its notes for the first time, often gaze up into the trees in anticipation of catching sight of the songster. It takes its name in part from the note of its song, which runs somewhat like this: tsuku-tsuku-uisu, repeated twice or thrice, and then the last note repeated several times alone and drawn out increasingly.

The wonderful bright-green grasshopper, called by the Japanese hotoko-no-uma, or 'the horse for the dead,' must be added to the garden insect orchestra. The reason for this strange name is not quite clear, although the head of the insect does bear a slight resemblance to that of a horse. It is a sociable little animal, and will not only enter the house boldly, but will permit itself to be taken up in the hand without alarm. But its voice cannot be compared with the notes of the more musical of the semi family.

There is another singing insect of the grass-hopper tribe, also green. It is a better singer than the other, and (as are perhaps sometimes human vocalists) is shyer of singing in consequence. Its song is really musical, and sounds very much like the words chon gisū, chon gisū, chon gisū, chon gisū.

In most gardens several kinds of tortoises are to be found, some of which are quite pretty and quaint. Tortoises are believed to live for a thousand years, and thus they are frequently depicted in Japanese art as the symbol of longevity.

A curious legend is attached to the turtle,

which is supposed in popular mythology to be the servant of the Dragon Empire beneath the sea. It is accredited with the power to create out of its breath either clouds, fogs, or a beautiful fairy-like palace at will. As might be expected, there is a charming fairy story or folk-tale of Urashima, with this peculiar gift of the turtle as its basis.

There are several kinds of snakes in Japanese gardens. Some of them, besides being very beautiful, are amphibious, coming out of the water on hot days to sun themselves on the rocks or sandy paths skirting the pools. In many parts of Japan it is considered very unlucky to kill a snake, and so it happens that should one come into the house by any chance, it is imperative that it should be politely ejected by the gentle suasion of a bamboo rod by one of the maids, rather than killed or put out by superior force. There is, in fact, a saying in Izumo that if one kills a snake without great provocation, one is sure afterwards to find its dead head in the box where the cooking-rice is stored.

There are many folk-tales connected with the insects and animals of the fields and gardens of Japan. Some are quaint, and others bear strange resemblances to similar ideas of metamorphoses met with in the tales of ancient Greece.

One of the insects, which comes in from the garden and buzzes to its death in the lamps at evening, is known as the sanemori. The name is also that of a famous warrior of Old Japan who fell fighting bravely in a rice-field after his horse had been killed under him. The story goes on that when he had been overtaken and slain by his enemy his soul became an insect which devoured rice, and was given the name of Sanemori-San by the peasantry of Izumo. Fearful of the depredations of this famous warrior who was metamorphosed into an insect, on certain nights during the season of rice the peasants of the district light fires in the fields and play on flutes or bamboo pipes with a view of attracting the insect to the fires, calling out at the same time a pressing invitation: 'Oh Sanemori, augustly deign to augustly come here.' A religious rite is also sometimes performed, and a straw figure made in the shape of a horse and rider is then either burnt or cast into the nearest canal or river; the peasants believing that when this act has been accomplished the fields will be immune from the attention of the sanemori.

The fireflies also come glinting into the darkest corners of the room and shine in the shadow of the garden after sunset, with the light as of tiny stars fallen from the dark-blue sky; and on the ceiling of many houses will suddenly appear a little gray lizard in search of flies and other prey—a pretty, harmless creature which no one disturbs. The moths which also enter the house at dusk are many of them extremely large and beautiful. Some are welcome because of their loveliness. But there is one at least which is of

ill-omen, known as the okori-chōchō, or aguemoth, whose large body and dusky brown wings flecked with silver-gray are said to bring fever into every house that it enters. And with the moths of various kinds come innumerable beetles, one species of which, the goki-kaburi, is supposed to devour human eyes.

And thus when night has fallen, and strange shadows form in the garden below the engawa, and bushes which bore normal shapes in the sunlight suddenly seem to take upon themselves weird resemblances to animals and terrible uncouth beasts, sometimes in the distance is heard the voice of one crying, as though in terrible pain, Ho-to-to-gi-su, which is also the name of the bird whose wonderful utterance has given rise to numberless uncanny tales and legends. By many a peasant, and even others, in Japan it is not thought to be a bird at all, but a wandering soul from the Land of Darkness, which has strayed out of the realm of the dead over the sunless hills of Shiede, which all poor souls must cross to reach the place of judgment. Once in every year, they say, it comes at the end of the fifth month, on its weary way to the Kingdom of Emma, who is the King of Death.

Very different is the sound of another garden visitant, the moving, gently caressing call of the yamabato, or dove, which few can hear without a responsive call in their heart.

These, then, are some of the beautiful and quaint inhabitants of the gardens of Japan, each of which contributes in some measure to the interest which such gardens always exercise.

THE MELODY OF SPRING.

Sing, throstle, sing,
Within the still woods where the bluebells ring,
Where lilies of the valley scent the shade,
And bright-eyed blossoms light the dusky glade;
While wanton Spring,
Thrilled by the rapture of bold Zephyr's sighs,
Disdains to hide her loveliness from longing eyes.

Sing, lark, above,

Lost in an ecstasy of joy and love!

Beyond the mists that shroud the sun from sight

Trill out thy strain of wonder and delight

O'er hill and grove,

O'er verdant field where, silent on her nest,

O'er verdant field where, silent on her nest, Thy mate enchanted sits with tender, throbbing breast.

Sing, heart of mine!
Yield to the magic of love's song divine;
Its mystic beauty, thrilling vale and hill,
Shall sound in thy dim cloisters sweeter still;
There brighter shine,

Star-like, the blossoms where love's footsteps fell

Than all the countless flow'rs that deck the fragrant dell.

NORA C. USHER.

THE TRAMP.

By C. EDWARDES.

LET me whisper in the beginning that the tramp was a boat without a character, and that her owners would be delighted any day to learn from a Lloyd's agent that she lies, poor thing (with of course all hands saved), at the Atlantic bottom-in mid-Biscay-Bay for choice -where you may drop a lead a thousand feet, and there could be no hope of her recovery and reinstatement as a seafarer by any human apparatus. The captain, his three mates, the chief-engineer, and the steward all called her names of the kind that are lavished by rude tongues upon the most unworthy of their fellowcreatures. It was usual after a trip for quite half the crew to stampede with their pay and certificates of discharge. Now that I know how easily these same so-called able seamen (foreigners for the most part) earn their five pounds ten shillings a month, and substantial rations, with the luxury of free physic and idle Sundays thrown in, I realise to the full what a vile old wretch this tramp must have been. I understand also, as I did not at the time, why the younger partner of the shipping firm that owns her wished me good-bye in the office with a businesslike eye that refused to meet mine, after assuring me that I was a bold man. I fancied at the moment that I was bold merely because it happened to be blowing 'great guns' outside just then, as even a landsman from the interior expects it to do on the sea-coast in March-'Bad weather in the Bay,' and that sort of thing! But he was right. I was bold, and rather imbecile to boot, to step from the midst of home comforts on shore into this iron husk of an old thing, with a dirty cargo, and neither the will nor the ability to put a passenger at ease with himself. She was nearly thirty years of age, without a rat or a black cat on board; and the skipper's final minutes ere he cast off at a dismal hour in the morning were harassed by the intelligence that two new apprentices had bolted out of her in the night, facing all the consequences rather than go to sea in a boat about which they had doubtless been stuffed with ill-omened yarns during their couple of days' attachment to her.

We steamed away with the barometer at 29.15, and wind to match; and when the pilot had been turned loose, and the skipper had dis-

carded his fur-lined coat for a seasoned oilskin and sou'wester, thoroughly befitting the outlook, we settled into a down-we-go and (with luck) up-we-come kind of hellcat movement, which we maintained during five days. There was no danger, even when the glass had alarmed the skipper and roused the mate's choicest prophecies by dropping to 28.4. The winds blew and the seas swept us all ways, but the elements could get no worse antics out of us than those with which we started. It was a time of holding on and starting eyeballs. I have seen many miserable men in my life, but scarcely one so continuously wretched as the steward of this ship in his tiny pantry opening out of the pretty good cabin which was the officers' mess-room. The discord of breaking crockery was ever in his ears, and he was, I fancy, the most contused man on board, due to the perils of his passages to and from the cook's galley with and without soups and ugly-looking joints. Every one, of course, shared in these discomforts, though not so bountifully as the steward. At night even I, the passenger, with the best bunk in the ship after the skipper's, could not keep fast in it. It was steadier in the chart-room under the bridge, where a succession of grimy mariners of nine nations, and the two brave other apprentices who still stuck to the ship, worked their twohour spells at the wheel, with ears and countenances unstirred by the remarks of the lusty young British mate plodding backward and forward in that breezy part of the tramp; steadier still in the engineers' quarters amidships; and steadiest of all in the stokehold, where the warmth was an agreeable change from the shivering upper blasts until we were off Cape Finisterre—with, however, reactions which seemed straight temptations to pneumonia. But movement was easy nowhere except in these plutonic deeps. The Bay under such conditions taught me much. I learned as never before why seacaptains are so simply gratified in the matter of pleasures ashore, and the significance of the wrinkles which furrow their honest brown foreheads even in comparative youth. understood completely for the first time why sailors swear more than other men. The dangers of the sea are as nothing to its exasperations. Only saints, the half-witted, and aged philoso-

phers with immaculate constitutions may bear such trials without a craving for relief that becomes overmastering. It must be a word or a blow in some direction; and a few strong and not necessarily heart-felt words in a small crowd all addicted to strong words seem better, upon the whole, than a brain-fever due to hard-forced suppression of a quite natural impulse.

But with Spain in the offing there came a soothing improvement, and on the sixth night banjo and concertina music from the more cultured members of the crew hailed the pleasanter portents. We ate our meal for the first time with genuine smiles, and almost mocked the fiddles which still kept our plates in their places. But let me say at once while I remember this telling truth—the fiddles were a wise precaution throughout the voyage. Even on the blue summer seas beyond Gib's white rock, by some devilish contrivance of the cargo or the tramp's architect, we still rolled. Thanks to this perpetual derangement of our equilibrium and the weakness of our aged engines, we cut a very humiliating figure on the Atlantic highway from Finisterre to St Vincent. One after the other, mean little vessels loaded to the last ounce of their capacity caught us up and passed us by. Sometimes they signalled us sarcastic remarks about ourselves, and once the mate took great pains in the night to spell out a sympathetic flashlight inquiry as to whether we were in distress of any kind. The skipper made a lurid face the next morning at the breakfast-table when the mate told him about this benevolent stranger's interest in us, and for the nth time or so in the trip he echoed his owners' wishes that the poor old tramp was safely sunk and done with. But there was no getting away from the fact that we seemed reasonably certain to reach our destination; and so it fell out, and there were hours in the Mediterranean in the meantime when even the skipper threw off his anxieties and sat heaving moderately at ease with his passenger under an awning in the afterpart of the ship, and told romantic tales of his sea-going days in stately wind-jammers with masts as tall as a church steeple, and thus between blue sky and blue sea forgot briefly that he was captain of a vessel that could add to his reputation only by

Another week and we were back at Gib, well blessed by the barometer since we had come through the Strait, but still waddling in smooth water. And then our troubles renewed themselves. It was not real bad weather, or anything like it; but we were so high out of the water, now that we were empty and not half ballasted, that we made frantic oscillations in a mere

Atlantic swell, fretted off and on by capfuls of wind on the beam. There were no more banjo and concertina orgies. One of the relatively heroic apprentices broke his head badly against a stanchion, and every one's temper got ajar as at first. Our third leisure Sunday brought us into mid-Bay once more, and here indeed the Atlantic was in a temper again much like our own. But I had my best laugh of the trip in contemplation of a procession of sick-stomached and sore-headed able seamen to the steward and his little pantry about the time when the devout on shore are in church and chapel; 70 per cent. of the crew discovered this Sunday that they had ailments, more or less acute, which cried aloud for treatment. The idea was that they might get a little rum administered; but the steward had had word from the skipper to give them black draughts one after the other instead. It was all the same what they complained ofblack draught was their portion from the medicine-chest. I gathered that these homeward-bound trips across the Bay usually end thus. If so, no treatment could have been more impolitic in a skipper who wished to keep the same crew intact for two successive voyages. Even with the prospect of a month's pay in a day or two, our miscellaneous gang of mariners were a sullen-faced lot as we laboured drunkenly through our final hundred miles of water. But in truth, like themselves, the skipper also was beset with raw edges by this time, and professed not to care a herring or so what happened to the ship or her overpaid, so-called able seamen when once he had got her docked. He and his officers alike seemed to think it impossible that the owners would send the poor doddering old tramp on another voyage after this one.

They did, though, but without a passenger, which was perhaps really the ultimate temptation of the Fates. And sometimes in the quiet of the night, in my anchored bed at home, I find myself awake and conjecturing about her. Is she making four knots, five, or a straining six, and rolling thirty-five or forty degrees? And what is the very latest compound adjective of the first mate's fertile mind, invented for application to the Greek, Russian, or Levantine hybrid who has seemed to snore at the wheel? And when -oh, when !--will these same Fates, in their mercy, put an end to the poor boat without endangering one of the lives aboard her? After much thought, I have come to the conclusion that I do not know which I admire most—the audacity of rich men who own ships like this one, the courage of the intelligent men who command them, or the superb endurance of these groaning old tramps themselves.

A KNIGHT ON WHEELS.

CHAPTER XXI.-THE PROVING OF THE BRAKE.

ON Monday morning Philip rose early. He had a hard week before him, for besides performing his usual duties—and their name was legion at this busy season of the year-he hoped to devote an afternoon to an exhaustive trial of the Meldrum Automatic Electro-Magnetic (described by the ribald Timothy as the Ought-to-Scrap-It, Don't-You-Forget-It) Brake. He was anxious, later in the week, to run down to Coventry and persuade the conservative Bilston to extend official recognition to his offspring.

He devoted two hours before breakfast to the more tender adjustment of the mechanism of the brake, which he had attached to the servicecar provided for his use by the company. The car consisted mainly of a long, lean, powerful chassis, destitute of ornament, and fitted with a skimpy and attenuated body of home manufacture. He was assisted in his operations by Mr Brand. once more unclothed and in his right mind. Brand had taken a reluctant but irresistible interest in the evolution of the brake. Indeed, one or two practical suggestions of his had been incorporated in the final design.

At last the work was completed. Philip climbed out of the pit and disconnected the

inspection lamp.

'That's great, Brand,' he said. 'Thank you for all your help. If the company takes the invention up, I hope you will accept 5 per cent. of the first year's royalties as your just commission.'

It was an unnecessarily handsome offer, but Mr Brand was not particularly cordial in his thanks. He would have preferred on the whole to receive nothing whatever for his assistance, and so be able to announce that Labour (himself) had done the work, while Capital (Philip) drew

the profits.

Early in the afternoon, after a crowded morning in the office, Philip ordered round the service-car and set off upon his trial trip. First of all he tested his brake in the surging torrent of Oxford Street. In this enterprise he received invaluable assistance from that strange animal the pedestrian, and wondered for the hundredth time, as he eluded a panic-stricken party of shoppers who had darted out of Marshall & Snelgrove's apparently for the express purpose of getting run over, why it is that the ordinary citizen—even the selfconfident Cockney-who desires to cross a crowded street should invariably put his head well down and run rather than keep it well up and walk. However, he was gratified to find that the brake performed its duties without undue suddenness and held the car without apparent Affort.

and, gliding sedately past the long rows of green chairs, emerged at Albert Gate and sped down the Fulham Road. Presently he was across Putney Bridge. Twenty minutes later he cleared Kingston, and leaving Suburbia, with its tramlines and other impedimenta, far behind him, headed joyoualy for the Surrey hills.

It was a perfect afternoon in June, and Philip, who for some reason was in a reminiscent mood. wandered back in his thoughts to his first motorride—that ecstatic and epoch-making journey in Mr Mablethorpe's fiery chariot, Boanerges of

blessed memory.

Boanerges, alas! was no more. A fighter to the last, he had met his Waterloo more than two years ago in a one-sided but heroic combat with a Pantechnicon furniture-van. Always a strategist, Boanerges had taken the van in the rear, charging through its closed doors with devastating effect, and recoiling into the roadway after the impact with the first fruits of victory, in the shape of a wash-hand stand, adhering firmly to his crumpled radiator. But his triumph was momentary. The radiator stood gaping open; the cooling waters imprisoned therein gushed forth; the temperature of Boanerges rose to fever-heat; and, as the faithful engine refused under any conditions to stop running, the whole sizzling fabric rapidly heated itself to redness. and finally burst into flame, furnishing the inhabitants of Maida Vale with the finest and most pestiferous bonfire ever seen in Watling Street. So perished Boanerges, and the washhand stand with him. Pax cineribus!

Roaming farther down the avenues of remembrance, Philip came next to the affaire Pegs and the house on Hampstead Heath. Performing a brief sum in mental arithmetic, he calculated that Pegs would now be about twenty-one. Perhaps she was married by this time. Indeed it was highly probable, for Montagu Falconer was not precisely the sort of person with whom one would choose to dwell longer than was absolutely necessary. Still, it was odd to think of such a little girl being married. He recalled some of their quaint childish conversations, and was conscious of a sudden desiderium—there is no exact word for it in English-for the days that were no more. It would be pleasant, he reflected, to have some one beside him nowespecially some one with kind brown eyes and wavy hair-to cheer him with her presence and act as a repository for his private thoughts and ambitions. However, his own proper Lady would come along some day. Would she be ambitions. like Pegs? he wondered.

He touched the accelerator with his foot, and At the Marble Arch he turned into the Park, | the car began to breast the three-mile slope of

Wickmore Hill. It was on the farther side that he proposed to test his brake.

Meanwhile, along a road running almost parallel with Philip's, and ultimately converging on to Wickmore Hill itself, came another car. It was a Britannia, of a four-year-old pattern. It was driven by a gentleman with a yellow beard, into which streaks of gray had made their way. Beside him sat a girl. The gentleman, her father, had just completed a sulphurous summary of the character of the man who had designed the carburettor of the car, not because of any inherent defect in the carburettor itself, but because the gentleman—for a variety of reasons, the most cogent of which was an entire ignorance of the elements of motor-mechanicshad twice stopped his engine in the course of

Presently they emerged from the side-road on to the summit of Wickmore Hill. The gentleman stopped the car by a fierce application of the brakes.

'I shall write to the band of brigands who sold me this condemned tumbril,' he announced,

'and ask for my money back.'

'Considering that we have had the car for nearly four years now,' remarked his daughter calmly, 'won't they think we have been rather a long time making up our minds about it?'

'Don't be ridiculous! How could I detect the fault when I had never driven the car myself

until to-day?' snapped the car's owner.

'I should think,' said the girl, 'that if there had been a fault Adams would have noticed it.'

This apparently harmless observation roused

quite a tempest.
'Adams? That numskull! That bumpkin! Haven't I been compelled to dismiss Adams from my service for gross incompetence—only yesterday? How would he be likely to notice faults in a car?'

'I don't know, I'm sure,' was the unruffled reply, 'except that he was a trained mechanic

and a good driver.'

At this moment a Gabriel horn fluted melodiously in the distance. Philip was coming up behind, climbing the hill at thirty miles an hour. Seeing a car in front of him at a standstill, he slowed down punctiliously, and glanced in an inquiring fashion at its occupants as he slid past.

'Filthy road-hog!' bellowed the gentleman at the wheel; and Philip went on his way.

The gentleman turned to his daughter. let's have no more nonsense about Adams,' he said. 'I admit he had a wife and four children, but you can hardly hold me responsible for that. Moreover, he was a yahoo. He decorated the interior of the garage—my garage—with chromo-lithographs, and his wife kept wax-fruit under a glass case in her parlour-window. I have dismissed him, and there is an end of it. Let

us cease to be sentimental or maudlin upon the

'You might have given him a character,' said

the girl.

'If I had,' replied her father grimly, 'he would never have obtained a situation again.'

The girl changed the subject. 'Don't you think,' she said, 'that if we are really going to call on the Easts we had better be getting on? And go gently. The foot-brake is a good deal worn, and the side-brake won't hold this heavy car if it gets on the run down this hill.'

'If there is one thing,' replied her amiable papa, 'about this miserable and untrustworthy vehicle which can be relied upon at all, it is the

efficiency of the brakes.'

They set off with a jerk.

Meanwhile Philip, a little startled at the reception accorded to his tacit offer of assistance, was running down Wickmore Hill. It was a long descent-nearly three miles-but was not steep, and there were no sharp curves until near the bottom. It was a useful spot for brake-

'I wonder who that old cuss was,' mused Philip. 'Rum bird. One of our cars, too. There was something familiar about his voice. Road-hog, indeed!' Philip grunted indignantly, for he was a virtuous motorist. 'Now I will really hog it a bit; this is a lovely piece of road. I'll let the old car rip for a couple of hundred yards, and then see what the Ought-to-Scrap-It will do. There was a girl with him, too. I wonder what her face was like, behind that thick blue veil. Now then, old friend, put your back into it!' He patted the steering-wheel affectionately. 'Off you go!... No, steady! Wait a minute.'

He closed down the throttle, for another car was coming down the hill behind him, and he intended to let it pass in order to have a clear road for his own operations. He looked round.

'What in thunder'-– he began.

All was not well with the oncoming car. The horn was being blown unceasingly, and some one appeared to be shouting. As Philip looked, he saw that it was the Britannia car which he had passed at the top of the hill. It was going thirty miles an hour, and swaying a little from side to side. Next moment it was past him.

The gentleman at the wheel turned to Philip as they shot by. 'We are running away, damn

you!'he bawled.

It was what geometricians call a self-evident proposition; though why Philip should be damned because an incompetent stranger had allowed his car to get out of control was not readily apparent. Still, there was no time to sift the matter. Something must be done promptly, or there would be a hideous disaster. Besides, the man at the wheel was no stranger. Philip recognised him now.

Philip's foot came down upon the accelerator, and the low car leaped down the hill. Philip's mind was suddenly and tensely clear. There was only one thing to do, and the Meldrum Ought-to-Scrap-It, Don't-You-Forget-It Brake would have to do it. Otherwise—— 'Lucky there's no sharp turn for nearly two miles,' he muttered to himself between his locked teeth. 'Pray God we meet nothing coming up the other way! Now to get past! My word, they are swerving badly!'

Next moment he was abreast of the flying

'Get right behind me, if you can,' he shouted,

'and I'll try to stop you.

The only response to this appeal was another swerve on the part of the runaway, in avoiding which Philip nearly cannoned into a tree at the side of the road. The gentleman with the beard appeared to have lost his head altogether. His efforts to avoid disaster were now limited to swearing volubly and blowing his horn. Philip noted that the side-brake was full on; but it seemed to have little effect in checking the car.

'Stick to your wheel, you fool!' he shouted with the full strength of his lungs.

The gentleman responded with a fresh outburst of vocal and instrumental exuberance. suddenly, just as Philip shot ahead, the girl in the blue veil leaned over and gripped the wheel in her two hands. Her parent immediately relinquished his hold altogether, and devoted his undivided attention to the horn.

Then followed the fullest and most eventful minute of Philip's life. He was ahead now, going perhaps fifty miles an hour, but clear in front of the other car. He knew he must act at once, for there was barely half a mile of straight road left, and there were two sharp turns at the foot of the hill. What he had to do must be done instantaneously, and called for superb driving. He wondered if the girl behind could hold on long enough to give him a chance. To steer a car steadily from any position except the driver's seat is a difficult enough performance, but to accomplish it when the seat is occupied by a gesticulating lunatic is almost a physical impossibility, especially for a slightly built girl. Still, Philip had had time to note the prompt and decisive way in which this girl had grasped his purpose and carried out his instructions. He felt somehow that those small gloved hands could be trusted to cling gamely on until the end of all things.

Glancing back, he saw that the other car was now right behind him—seven yards or so. The moment had come—the inventor's moment. 'I told Timothy it would stop a motor-bus,' he observed to himself. 'We'll see if it will stop two cars.

The brake was controlled by a switch upon the steering-pillar. The farther the switch was pulled over the stronger became the current

which supplied the brake's magnetic force. it was not required yet. Philip first pressed down the foot-brake, which, though it could not check, sensibly moderated the headlong speed of his car; and then, getting both hands back to the steering-wheel, braced himself, and leaning well back with his feet on the pedals, waited for the impact of the runaway.

It came, but not too severely. By good luck or good management the pursuing car struck Philip's fairly and squarely in the back, and the two raced on down the hill, locked together like engine and tender, the sorely handicapped little chauffeuse behind exerting all her small strength to keep her leading wheels from slewing round. The shock of collision, coming where it did, sent a thrill of satisfaction coursing up Philip's spine.

'Oh, well done, well done, little girl, whoever you are!' he murmured enthusiastically. 'That gives us a Chinaman's chance, anyhow. Now /'

He pulled the switch of the brake slowly

over three parts of the way.

For a moment nothing seemed to happen; and then—oh, rapture !—the rocking cars began to slow down. The brake was answering to the call. The strain was immense, but the work was good.

On they tore, but more slowly, and yet more slowly. They were barely going twenty-five miles an hour now. Philip leaned hard back, gripping the wheel, and exulted. They were going to stop. The brake was proved.

Suddenly his eye caught a glimpse of a red triangle. They were coming to the turns sooner than he expected, for the pace had been terrific, and the whole incident had barely lasted a

hundred seconds as yet.

Well, they would just manage it, he calculated, provided that the smoking brake-shoes held out. They were running at a comparatively moderate pace now. A single car could have taken the approaching corner comfortably. The danger lay in the likelihood that the car behind would skid. Still, the little girl was steering like a Trojan. They ought to get off with a shaking at the

Round to the left they swung. glancing over his shoulder, could see the girl behind frantically wrestling with her steeringwheel. Next moment they were round. She had succeeded. The road was almost level now, but the second corner was imminent, and in the reverse direction, for this was what is technically known as an S turn.

Philip pulled his brake-switch into the very last notch and put his wheel hard over to the

right.
